(2). That hospital staffs be permitted to determine for themselves how often they need to hold staff meetings and what kind of meeting is best suited to solve the problems of the individual hospital;

(3). That accreditation never be withdrawn by the Joint Commission from a hospital in which questionable standards prevail until after a period of three to six months has expired and an opportunity has been given to the hospital to raise its standards within the period specified;

(4). That the Joint Commission of Accreditation of Hospitals and the Council on Medical Education and Hospitals of the American Medical Association shall maintain close liaison to assure that hospitals with teaching programs for interns and residents shall be continuouly advised as to the rules and regulations of both agencies in order to avoid a situation whereby a hospital with a satisfactory training program might lose its accreditation;

(5). That the American Medical Association, other interested national groups, and state and county medical societies be urged to publicize more adequately the activities of the Joint Commission on Accreditation of Hospitals so that the medical profession and hospital authorities will have a better understanding of the Commission's purposes, policies, regulations, and their interpretation.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George S. Klump, Chairman, Pennsylvania, submitted the following report, which was adopted:

Resolution No. 27.—The introducer of this resolution discussed it in connection with the Stover report and agreed that the latter covered the issues emphasized in Resolution No. 27. Dr. Kenneth B. Babcock, Chairman, Joint Commission on Accreditation of Hospitals, stated that he is recommending to the Commission that the "accredited" and "provisionally accredited" categories be abolished in favor of only one "accredited." Hospitals formerly provisionally accredited will be listed as accredited and will have a one year probationary period.

Your reference committee believes that no action is indicated on Resolution No. 27, and it so recommends.

No. 28.

Resolution No. 28 was withdrawn at the request of Dr. Charles L. Leedham, Section on Military Medicine.

No. 29. Resolutions on Improving Electoral College System

Dr. John K. Glen, for the Texas delegation, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

PREAMBLE

The present so-called Electoral College System of electing the President and Vice President of the United States was started decades ago under conditions greatly different from those existing in the United States today. The original conception was to provide a group of leading citizens of the country who would then impartially select the most capable men available for the offices. In practice it has now come to where theoretically it is possible for comparatively small groups in one or more states to exert a disproportionate influence in the selection of the chief executives of our country. Certainly the existing system does not give a true measure of the opinions of the majority of the voters. Several sincere attempts have been made in Congress to improve the Electoral College System, but so far no actual bills have passed the Congress.

Resolved, That the House of Delegates of the American Medical Association again urges the Congress of the United States to consider and make provision for some more equitable plan of electing the President and Vice President of the United States; and be it further

Resolved, That a copy of this resolution be sent to the President of the United States, to the members of his Cabinet, and to all members of Congress.

NOTE: The report of the Reference Committee on Legislation and Public Relations on Resolution No. 29 will be found following Resolution No. 22.

No. 30. Resolutions on Nationwide Commission to Study Social Security System

Dr. John K. Glen, for the Texas delegation, introduced the following resolutions, which, together with Resolution No. 31, immediately following, also introduced by Dr. Glen for the Texas delegation, were referred to the Reference Committee on Legislation and Public Relations:

PREAMBLE

The House of Delegates of the American Medical Association at its Boston meeting last November urged the Senate of the United States not only to reject H.R. 7225, but also to provide for a special Commission to Study the Social Security System, to be made up of citizens from all walks of life, as businessmen, professional groups, educators, social welfare leaders, financiers, and legislators. This special Commision would then be comparable to the so-called "Hoover Commission" that made a comprehensive study of governmental functions in recent years. The majority of individuals of groups who testified before the Finance Committee of the Senate in the hearings on H.R. 7225, urged the appointment of such a wide-based commission, but apparently such a recommendation has not been made to the Senate. There is still ample time for the Senate to take action, however.

Resolved, That the House of Delegates of the American Medical Association recommends and urges to the Congress of the United States the appointment of a nationwide Commission to Study Social Security with ample time to be allotted for the study and with provision for a full report of the findings and recommendations of the Commission to the entire country; and be it further

Resolved, That a copy of this resolution be sent to the President of the United States, to the Members of his Cabinet, and to all members of the Congress.

No. 31. Resolutions on Participation in Local Committees to Study the Social Security System

PREAMBLE

In recent months there has been a tremendous upsurge of interest among the general public in the Social Security System, largely because of the widely-publicized hearings before the Finance Committee of the Senate in regard to H.R. 7225. It has been pointed out from many angles that there has never been adequate study or proper publicity to the expanded philosophy and ultimate liabilities of the Social Security System. Inasmuch as the System is now involving personally a large majority of United States citizens, it is highly in order that intelligent citizens learn more about the philosophy and ultimate extent of the System. Physicians are citizens who can urge noonday service clubs, women's clubs, and similar citizens' discussion groups all over the country to make a special study of the Social Security System, even to the point of forming coordinated committees to study the social security system in every community.

Resolved, That the House of Delegates of the American Medical Association suggest and urge public-spirited citizens in all localities to make special study of the Social Security System, preferably through citizens' groups organized in each locality as may seem best; and be it further

Resolved, That a copy of this resolution be furnished to the press of this country, and that a copy be sent to each constituent state and territorial medical association with the suggestion that it be widely publicized within its area.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Willis H. Huron, Chairman, Michigan, read the following report, which was adopted:

Resolutions Nos. 30, 31, and 39 on Social Security.—Inasmuch as these resolutions reaffirm the position of this House of Delegates taken at the Interim Session in Boston in December, 1955, your committee recommends their approval.

No. 32. Resolutions on Possible Variation of Standards of Accreditation for Hospitals According to Size

Dr. John K. Glen, for the Texas delegation, introduced the following resolutions, which were referred to the Reference Committee on Medical Education and Hospitals:

PREAMBLE

Definite hardships continue to be incurred by small hospitals in their sincere attempts to qualify for accreditation by the Joint Commission on Accreditation of Hospitals. This is due primarily to the fact that the smaller hospitals do not have access to the facilities available to large, and particularly to primarily teaching, hospitals. The purpose of standardization is to insure competent medical care of patients in hospitals, and smaller hospitals with conscientious, capable men on their staffs can render high-standard medical care without necessarily meeting all the present detailed requirements for accreditation. It should be possible for the Joint Commission to divide hospitals into classes according to size or other factors, as Class A, Class AA, Class AAA, etc., where without any unfavorable comparison, but purely on a matter of size, hospitals would be expected to meet proper standards to insure adequate medical care for patients.

Resolved, That the House of Delegates of the American Medical Association recommend to the representatives of medical organizations on the Joint Commission on Accreditation of Hospitals, the institution of such a classification of hospitals according to size or other fair factors, in the way of setting standards of requirements for accreditation; and be it further

Resolved, That a copy of this resolution be sent to all members of the Joint Commission on Accreditation of Hospitals and to all state and territorial medical associations.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George S. Klump, Chairman, Pennsylvania, presented the following report, which was adopted:

Resolution No. 32.—The intent of Resolution No. 32 appears in the Stover Report, Section F (6): "... it is recommended that the Commission give serious consideration to establishing standards which may vary depending upon the size of the hospital. Each hospital should be judged on its own merits and efficiency, regardless of size."

Your reference committee recommends that no action be taken on Resolution No. 32, but wishes to emphasize the importance of flexibility and judgment in the application of any set of standards to a particular local situation.

No. 33. Resolution on the Guide to Grievance Committees

Dr. Arthur A. Lampert, South Dakota, introduced for the South Dakota State Medical Association, the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, Grievance committee activity has become such an integral part in the medical profession's public relations, and will continue to represent one of the more important points of contact between physicians and patients; and

WHEREAS, The Guide to Grievance Committees as published by the Department of Public Relations has been a great help to all the state associations' grievance committees, but falls short of providing actual interchange of ideas and methods of mediation of grievances; and

WHEREAS, Such interchange of ideas and methods of mediation of grievances would serve to aid in establishing uniformity of investigating and mediating procedures, thereby providing both patients and physicians uniform rights of expectancy of consideration; therefore be it

Resolved, That the American Medical Association consider regional or national conferences of state grievance committees and state executive secretaries to permit active interchange of investigative and mediating procedures, such interchange serving to promote a uniform right of expectancy of treatment of grievances to both patients and physicians.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Joseph C. Griffith, Chairman, Wisconsin, submitted the following report, which was adopted:

Resolution No. 33, proposes that regional and national conferences of state grievance committees and executive secretaries be set up to interchange ideas as to medical procedures. Your committee is informed that Dr. Culpepper's committee, which has published the Guide to Grievance Committees is actively preparing an appendix which will contain a wealth of material to serve the purpose of this resolution. Your committee does not recommend its adoption.

No. 34. Resolution on Lectures on Medical Ethics

Dr. C. J. Attwood, for the California delegation, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS, In these times of increasing pressure, close scrutiny, and greater demands, it is of paramount importance that relations between physicians as well as patient-physician relationships reflect the highest credit on the physician and on the medical profession; now therefore be it

Resolved, That the American Medical Association be urged to request each medical school to assign a member of the clinical faculty to give at least three hours of formal lectures on medical ethics, professional conduct, and manners each year to members of the senior class.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George S. Klump, Chairman, Pennsylvania, submitted the following report, which was adopted:

Resolution No. 34.—Lectures on medical ethics and related matters are now given in all but six of the four year schools and three of the schools of basic medical sciences as announced in the fifty-fifth Annual Report on Medical Education in the United States and Canada by the Council on Medical Education and Hospitals. Nevertheless, this resolution is most timely and there was considerable discussion at the hearing including that by a delegate from the Student American Medical Association which was greatly appreciated.

Your reference committee wishes to call the attention of the House to the important role that component county medical societies should assume in indoctrinating both the student and the young graduate in these matters. It recommends the adoption of this resolution.

No. 35. Resolution on Advertising Standards

Dr. C. J. Attwood, for the California delegation, introduced the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

WHEREAS, A year ago the American Medical Association discontinued the awarding of Council seals and advertising emblems to products and advertising copy which met acceptance requirements; and

WHEREAS, Increased pressure is sometimes being brought in the placing of advertising copy by the advertisers; and

WHEREAS, It is the duty and the prerogative of each medical society to maintain high standards for the acceptance of advertising copy in its official publications; and

WHEREAS, Some journals have established rules governing the acceptance of advertising copy; now therefore be it

Resolved, That the American Medical Association urge county and state medical societies independently to adopt advertising rules which are based on high standards of quality of product and proven accuracy of the advertising.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Woodruff L. Crawford, Chairman, Section on Pediatrics, read the following report, which was adopted:

Advertising Standards (Resolution No. 35).—This resolution on advertising standards for medical publications was considered favorably with these editorial changes:

Resolved, That the American Medical Association recommends that county and state medical societies adopt advertising rules which are based on high standards of quality of product and proven accuracy of the advertiser.

(To be continued)

MEDICAL NEWS

ARKANSAS

Society Election.—At a recent meeting of the Arkansas Radiological Society, Dr. Edwin F. Gray, Little Rock, was elected president, Dr. Joseph A. Norton, Little Rock, vice-president, and Dr. Ernest A. Mendelsohn, Fort Smith, secretary-treasurer.

CALIFORNIA

General Practice Meeting in Los Angeles.—The eighth annual scientific assembly of the California Academy of General Practice will convene at the Hotel Statler, Los Angeles, Oct. 14-17. Dr. Manuel E. Lichtenstein, associate professor of surgery, Northwestern University Medical School, Chicago, will present "Gall Bladder Disease and Its Surgical Treatment" and "Nonpenetrating Injuries of the Abdomen." Dr. Clarence S. Livingood, chief, dermatology division of Henry Ford Hospital, Detroit, will speak on "Diagnosis and Management of Dermatitis." "When Should Parents Leave Home?" will be the topic of Dr. Edward J. Stieglitz, consultant in geriatrics to the Veterans Administration, Washington, D. C. Dr. Sidney Farber, professor of pathology, Harvard Medical School, Boston, will discuss "Advances in the Chemotherapy of Cancer." "Emergency and Aftercare of Burns" will be discussed by Lieut. Col. Curtis P. Artz, formerly director of the surgical research unit, Brooke Army Medical Center, Fort Sam Houston, Texas The Ivan C. Heron Lecture will be presented by Dr. Christopher J. Duncan of Brookline, Mass., on "Reducing Complications in Total Abdominal Hysterectomy." Dr. Richard W. TeLinde, Baltimore, will give the Stanley R. Truman Lecture on "The Problem of Endometriosis."

COLORADO

Alpha Omega Alpha Lecture.—The annual Alpha Omega Alpha Lecture of the University of Colorado School of Medicine, Denver, will be presented in the Sabin Amphitheater, Oct. 12, 8 p. m. on "Newer Concepts in the Healing of Wounds" by Dr. J. Englebert Dunphy, professor of surgery, Harvard Medical School, Boston. Physicians are invited to attend

DISTRICT OF COLUMBIA

Personal.—Dr. Henry L. Darner, clinical professor of obstetrics and gynecology, George Washington University School of Medicine, Washington, D. C, was awarded the honorary degree of doctor of science by Western Maryland College, Westminster, Md, at commencement exercises June 4. Dr. Darner is chief gynecologist at the Central Dispensary and Emergency Hospital, and senior attending gynecologist at Garfield Memorial Hospital

FLORIDA

General Practice Meeting in Jacksonville.—The seventh annual scientific assembly of the Florida Academy of General Practice will convene Oct. 20-21 at the Hotel Roosevelt, Jacksonville, under the presidency of Dr. Leo M. Wachtel, Jacksonville. The following program will be presented Saturday morning.

Modern Drug Treatment of Tuberculosis, Howard M Dubose, Lakeland, representing the Florida Trudeau Society
Emotional Problems of the Young Adult, H. Keith Fischer, Philadelphia
Prevention and Treatment of Traumatic Injury in Athletes, A Lee Lichtman, New York
Cutaneous Manifestations of Internal Disease, E Richard Harrell, Ann Arbor, Mich
Management of Ulcerations of Stomach and Duodenum, Alton Ochsner, New Orleans

The morning speakers will participate in the afternoon session, which will consist of questions and answers and a roundtable discussion on "Emotional Problems in General Practice," moderated by Dr. Fischer. At the banquet, 8.30 p. m, Dr. Ochsner will consider "The Influence of Serendipity on Medicine." The following symposium on automobile safety is scheduled for Sunday morning.

Law Enforcement and Its Bearing on Accidents (film) and The Perfect Crime, Trooper D R Jansen, Florida Highway Patrol
Total Treatment of Crash Injury Victim, Preston A. Wade, New York
Psychiatric Aspects of the "Accident-Prone" Driver, Lieut Frederick L. McGuire, head of psychology department, U. S. Naval Hospital, Philadelphia.
Safety Features of the Modern Automobile, Fletcher N. Platt, Ford Motor Company, Dearborn, Mich

After luncheon a recapitulation by Mr. John O. Moore, director of automobile crash injury research, Cornell University Medical College, New York, will be followed by panel discussion, with Mr. Moore as moderator.

GEORGIA

Postgraduate Medical Sessions.—The Emory University School of Medicine, Emory University, will sponsor a postgraduate session on "Cardiac Arrhythmias," Oct. 19-20, in the physiology building. Two-day meetings will be held also in December, March, and May for the discussion, respectively, of liver diseases, electrolytes, and common diseases of the blood. Programs will be given by visiting and local specialists and will include lectures, round-table discussions, and presentation of patients. Dr. J. Willis Hurst, associate in medicine at Emory, is program director. Guest lecturers at the October session include Dr. Herman K. Hellerstein, Western Reserve University School of Medicine, and assistant physician, University Hospitals of Cleveland; Dr. Robert P. Grant, formerly of Emory, now of the National Heart Institute, Bethesda, Md.; and Dr. W. Proctor Harvey, Georgetown University Medical Center, Washington, D. C. Drs. R. Bruce Logue and Noble O. Fowler of Emory University and Atlanta will be among others participating. The first lecture on normal and abnormal heartbeat will be given at 8:40 a. m. Friday by Dr. Hellerstein, who will also deliver a lecture on cardiac arrest in the operating room, Saturday at 11 a m Sessions will meet all day Friday and Saturday morning. Registration is limited. The registration fee is $20, but interns and residents will be admitted without charge.

ILLINOIS

Society News.—The Illinois Society of Pathologists recently elected Dr. Dennis B. Dorsey, Danville, president; Dr. James W. Henry, Evanston, vice-president, Dr. Herbert P. Friedman, Urbana, second vice-president, and Dr. Frederick C. Bauer Jr., Chicago, secretary-treasurer.

Chicago

Orthopedic Society Meeting.—The Chicago Orthopaedic Society will meet at the Palmer House, Oct. 12. Dinner at 6·45 p m will precede the following program:

Contrast Arthrography of the Shoulder, Graham Kernwein, Rockford
Fractures of the Elbow in Children, Donald J Maylahn, Chicago
Discography in Diagnosis of Disorders of Intervertebral Discs, John J Davies, Moline

All physicians are invited to attend the scientific program.

Personal.—Dr. Joseph B. Kirsner, professor of medicine, University of Chicago School of Medicine, participated in the fifth International Congress of Gastroenterology, London, England, July 18-21, where he discussed "Exfoliative Cytology of the Colon in Ulcerative Colitis" and the use of adrenal steroids in the treatment of ulcerative colitis —Dr. Tibor Benedek, assistant clinical professor of dermatology, Stritch School of Medicine of Loyola University, has been promoted to associate clinical professor in the department of dermatology.

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education, and public health. Programs should be received at least three weeks before the date of meeting

Society News.—Newly elected officers of the Chicago Society of Industrial Medicine and Surgery include Dr. Cornelius M. Annan, president; Dr. Kenneth F. Stotz, vice-president; Dr. Bille B. Hennan, secretary; and Dr. Charles M. Drueck, treasurer.

Larger Plans for Presbyterian-St. Luke's Hospitals.—The Presbyterian-St. Luke's Hospital of Chicago was recently formed by merger of the two long-established hospitals. Each institution will continue to operate in its present location for about three years, when an 11-million-dollar expansion program will have been completed at Presbyterian Hospital in the West Side Medical Center, where the new, integrated hospital will be located. Ground-breaking ceremonies for an addition to Presbyterian were held March 20; but with announcement of the merger, plans were enlarged to include a 14-story wing, a doctors' building with private offices, a 160-unit apartment for professional personnel, and an annex for diagnostic self-service beds for patients not requiring complete nursing service. The school of nursing will be expanded also to accommodate 350 students. The new wing will include an enlarged x-ray department with a cobalt beam apparatus for cancer treatment, a floor for care of neuropsychiatric patients, an enlarged central supply, a 225-seat lecture room, and a chapel. It is anticipated that the merged hospitals will ultimately have a capacity of over 1,000 beds. At present St. Luke's has 553 beds and Presbyterian, 418. Dr. Karl S. Klicka, director of Presbyterian Hospital for two years has been appointed director of Presbyterian-St. Luke's. He is a member of the executive committee of the health division of the Chicago Welfare Council; member of the advisory committee, Chicago Hospital Council; and chairman of the Illinois Joint Commission for Improvement of Patient Care.

INDIANA

State Medical Meeting in Indianapolis.—The 107th annual meeting of the Indiana State Medical Association will be held in Indianapolis, Oct. 15-18 under the presidency of Dr. Walter U. Kennedy, New Castle. On Tuesday there will be reference committee meetings, the opening of the technical and scientific exhibits, the golf tournament and the trap-skeet shoot. The stag party and general entertainment will be held that evening. On Wednesday panel discussions and symposiums are scheduled on Radioisotopes in Diagnosis and Treatment of Thyroid Diseases, Parent Counseling for the Oversolicitous Parent and Caring for the Normal and Abnormal Infant, Backache, Industrial Dermatoses and Poisonings, Acute Renal Failure, Conservation of Vision, Alcoholism, Diabetes, Obstetrics, and Hypnosis. Wednesday night will be President's Night, with the president's address and entertainment in the Murat Theater. Thursday a symposium on "Carcinoma of the Breast" is scheduled for 10:30 a. m. Thursday afternoon the section on general practice will have as guest speaker Dr. Walter C. Alvarez, Chicago, who will talk on "The Minor Variances of Epilepsy." The annual banquet will be held Thursday night.

KANSAS

Personal.—Dr. Ralph I. Canuteson, director of student health services at the University of Kansas, Lawrence, since 1928, has been given a Fulbright research award. He plans to do research in the field of college health at the University of Oslo, Norway, in 1957.

MICHIGAN

Dr. Miller to Direct Institute of Industrial Health.—Dr. Seward E. Miller has been granted a leave of absence from the U. S. Public Health Service to accept, effective Sept. 1, the directorship of the University of Michigan's Institute of Industrial Health. Dr. Miller has been an officer of the Public Health Service since 1933, his first 12 years having been spent in clinical pathology in service hospitals in various parts of the country, and the next five years in the service's Communicable Disease Center, Atlanta, Ga., where he developed training programs for physicians and technicians in laboratory diagnostic medicine. For the last two years he has been chief of the division of special health services, which includes activities in the fields of occupational health, chronic diseases, tuberculosis, heart disease, and venereal disease control. Dr. Miller will also receive teaching appointments in industrial health in the University of Michigan's schools of Medicine and Public Health. He is the editor of "The Textbook of Clinical Pathology," now in its fifth edition.

Symposium on Endocrines and Nutrition.—A Symposium on Endocrines and Nutrition will be held in the amphitheatre of the Horace H. Rackham School of Graduate Studies, Ann Arbor, Oct. 11-12. Dr. Frank H. Bethell, Ann Arbor, will serve as chairman for the morning session, and Halvor N. Christensen, Ph.D., Boston, for the afternoon session Thursday. Presentations will include the following:

Effects of Dietary Factors on Production of Adrenal Steroids, Albert B. Eisenstein, St. Louis.
Effect of Liver Disease on Adrenal Cortical Function, Frank H. Tyler, Salt Lake City.
Primary and Secondary Aldosteronism, Jerome W. Conn, Ann Arbor.
Effect of Endocrines on Vitamin Requirements, Joseph Meites, Ph.D., East Lansing.
Newer Concepts on the Action of Insulin, William C. Stadie, Philadelphia.
Effects of Growth Hormone on Protein and Carbohydrate Metabolism, Jane A. Russell, Ph.D., Atlanta, Ga.
Effects of Endocrine Glands and Stress on Fatty Acid and Ketone Metabolism, Frank L. Engel, Durham, N. C.
Relationship of Vitamin B12 to Carbohydrate Metabolism and Diabetes, Bacon F. Chow, Ph.D., Baltimore.
Metabolic Effects of Aryl Sulfonylurea Compounds in Normal and Diabetic Subjects, Stefan S. Fajans, Ann Arbor.

Dr. William D. Robinson will serve as chairman for the Friday session, which will include the following presentations:

Goitrogens in Food as a Cause of Goiter, Monte A. Greer, Portland, Ore.
Influence of the Pituitary and Adrenals on Digestive Functions, Burton L. Baker, Ph.D., Ann Arbor.
Influence of the Pituitary on Hemopoiesis, Roger C. Crafts, Ph.D., Cincinnati.
Control of Erythropoiesis by Humoral Factors, Albert S. Gordon, Ph.D., New York.

All persons attending the symposium are requested to register (no fee). Information may be obtained from The Thomas Henry Simpson Memorial Institute for Medical Research, University of Michigan, Ann Arbor, or the National Vitamin Foundation, Inc., 15 E. 58th St., New York 22.

Health Conference in Detroit.—A Regional Health Conference for the Wayne County area will be held Oct. 10 at the Garden City High School, Detroit, with the co-sponsorship of the Michigan Health Council of Lansing. The keynote speaker will be Dr. John S. DeTar, Milan, president of the American Academy of General Practice.

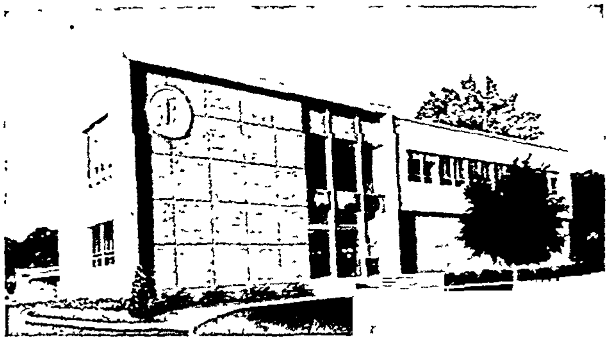
MINNESOTA

Personal.—Dr. Theodore A. Clifton, Chatfield, recently retired after 46 years in the practice of medicine. Dr. and Mrs. Clifton will now make their home in Hollywood, Fla.

MISSOURI

Hospital News.—Dr. Raymond O. Muether, associate professor of internal medicine at St. Louis University School of Medicine, has been elected president of the staff of the St. Mary's Group of Hospitals of St. Louis University. The other newly elected officers are Dr. Grey Jones, assistant professor of clinical gynecology and obstetrics, vice-president; and Dr. Paul Murphy, associate professor of clinical medicine and chief of the section of chest diseases, secretary. These new offices were planned "to increase the participation of staff in the professional policies of the hospital."

New Headquarters for Academy of General Practice.—The new national headquarters building of the American Academy of General Practice in Kansas City was dedicated on Sept. 1. The principal speaker was Dr. Dwight H. Murray, Napa, Calif., President of the American Medical Association. In the $600,000, four-story reinforced concrete building, at the corner of Volker and Brookside boulevards, will be offices of the staff of the academy and the editorial and business offices of its monthly publication, GP magazine. It contains 30,000 square feet of floor space and plans permit vertical or horizontal expansion. The first-floor lobby of the T-shaped building is of terrazzo and Lido marble, imported from French Morocco. Tempered glass stairway panels and a custom-designed brass candelabra complete the lobby decor. The main conference room has African cherry wood paneling, electrically operated draperies, a custom-built fruitwood conference table, and a portrait of the late Sir Alexander Fleming, discoverer of penicillin and an honorary member of the academy. The original culture from which penicillin is derived is on display in the conference room. The second floor lobby will overlook the new Milnes fountain and the planned esplanade leading from Volker Boulevard to the steps of the Nelson Gallery of Art. The basement floor includes a kitchen, an employees' dining room, a second conference room that can accommodate 200 people, and automatic addressing equipment. The subbasement will be used for inactive files and storage. Landscaping plans include a fountain, a courtyard, and a patio.



New American Academy of General Practice headquarters.

NEW JERSEY

Orthopedic Society Meeting.—The fall meeting of the New Jersey Orthopedic Society will be held at the Hunterdon Medical Center, Flemington, Oct. 13, 10 a. m.-4 p. m., and will be open to all physicians. Included in the program will be a paper by Dr. Edward Schlesinger on "The Problem of Leverage Above Spinal Fusions." Dr. Joseph W. Fielding will present "Cinefluorography of the Cervical Spine," and Dr. A. Hudacek will speak on "Production of Pigmented Villonodular Synovitis in Laboratory Animals." The remainder of the day will be devoted to business and social activities of the society, and will be open only to members.

NEW YORK

Personal.—Dr. Harry C. Storrs, director of Letchworth Village, Thiells, for the past 19 years, retired June 30 after 44 years of service in the department of mental hygiene.

Course on Fluid and Electrolyte Therapy.—The University of Buffalo School of Medicine will present a postgraduate course on Fluid and Electrolyte Therapy in Medicine, Surgery, and Pediatrics, Oct. 18 at Meyer Memorial Hospital (K Building Conference Room). Drs. Charles U. Lowe, George E. Miller, Worthington G. Schenk Jr., and Robert Tarail, all of the school of medicine, will participate in "Typical Problems in Fluid Therapy: Case Presentations" at 9 a. m. Dr. Miller will present "Units of Measurement" at 10 a. m., followed by "Common Pitfalls" by Dr. Tarail, "General Principles of Fluid and Electrolyte Therapy" by Drs. Lowe and Tarail, and "Materials and Methods" by Dr. Schenk. A panel discussion and question period on "Clinical Management of Fluid and Electrolyte Problems" will be held at 2:30 p. m. in Room G7, Capen Hall, University of Buffalo. All registrants for the course are invited to attend the Harrington Lecture, "Thirst—The Acquisition of Water: Its Significance in Relation to the Volume and Composition of the Body Fluids," by Dr. Maurice B. Strauss, professor of clinical medicine, Boston University School of Medicine, at 4:30 p. m. in Room G22 of Capen Hall. Fee for the course is $15. Checks should be made payable to the University of Buffalo, and registration forms sent to Dr. Milton Terris, Assistant Dean for Postgraduate Education, University of Buffalo School of Medicine, 3435 Main St., Buffalo 14.

New York City

Harvey Lecture.—The second Harvey Lecture in the 1956-1957 series will be delivered Oct. 11, 8:30 p. m. at the New York Academy of Medicine, 103rd Street and Fifth Avenue by Dr. David Bodian, Johns Hopkins University School of Medicine, Baltimore, on "Physiologic Aspects of Infectious Processes in Poliomyelitis."

Graduate Program in Obstetrics and Gynecology.—Columbia University College of Physicians and Surgeons has established a program in its department of obstetrics and gynecology directed toward the training of academic personnel for full-time work in departments of obstetrics and gynecology. The program, supported by the Josiah Macy Foundation, provides for the financial support of a few individuals with scientific orientation over a five-year period following their internships. The student will spend the first two years in one of Columbia's basic medical science departments learning more about scientific thinking and techniques, and will devote the subsequent three years to residency training in the department. Individuals in this program will receive approximately $4,000 annually during the first two years and augmentation of the usual hospital residency stipend to maintain this income level during the last three years. This program aims to attract individuals with definite interest in full-time teaching and investigation in this field.

Symposium Day on Diabetes.—"Insulin, Glucagon and the Oral Hypoglycemic Sulfonylureas" will be the topic for the fourth annual symposium day, Oct. 12 (Auditorium, Hunter College, 695 Park Ave.) sponsored by the New York Diabetes Association (270 Park Ave.). Dr. James F. Hart is president of the association. The following program will be presented:

Cell Types in the Islets of Langerhans and the Hormones They Produce, Arnold Lazarow, Minneapolis.
Locus of Action of Insulin, DeWitt Stetten Jr., Bethesda, Md.
Chemical Structure of Glucagon, William W. Bromer, Ph.D., Indianapolis.
Physiologic Role of Glucagon, George E. Anderson, Brooklyn.
Pathologic Effects of Large Amounts of Glucagon, J. M. Salter, Ph.D., I. W. F. Davison, B.Sc., and Charles H. Best, Toronto, Canada.
A Sequential Appraisal of Glucagon, Herbert M. Evans, Berkeley, Calif.

The afternoon session will include the following presentations:

Historical Review of Oral Substitutes for Insulin, Martin G. Goldner, Brooklyn.
Mechanism of Action of the Sulfonylureas, Rachmiel Levine, Chicago.
Studies on the Action of the Sulfonylureas, Robert W. Cox and Robert H. Williams, Seattle.
Clinical Effects of the Sulfonylureas, Max Miller, Cleveland.

The closing discussion will be led by Dr. Best. Drs. Harold Brandaleone and Irving P. Graef will preside over the morning and the afternoon session, respectively. The symposium is supported by a grant-in-aid from Eli Lilly and Company. The evening program will be held at the New York University Club, 123 W. 43rd St., where cocktails (6:45-7:15 p. m.) will precede dinner ($8 per person; informal dress). The after-dinner speaker, Dr. Herbert M. Evans, director emeritus, Institute of Experimental Biology, University of California Medical School, Berkeley-San Francisco, will have as his topic "What Doctors Have Written."

PENNSYLVANIA

Leaflets on Sight Saving.—The Pennsylvania Association for the Blind has published two new leaflets: (1) "Take Time to See," which discusses correct lighting, reading and other close work, and aids to vision, and presents TV hints; and (2) "Cross-Eyes," which gives signs, causes, and correction. Samples of these folders are available on request to the Philadelphia Foundation for the Blind, 100 E. Price St., Philadelphia 44.

Philadelphia

Symposium on Air Pollution.—A public symposium, "Cleaner Air for Urban Areas," will be held at the Franklin Institute Oct. 15. The symposium, coordinated with Philadelphia's "Cleaner Air Week" (Oct. 21-27), will feature exhibits of equipment used in air pollution research and control and a tour of the institute's air pollution research laboratory. The fee for symposium registration will be $15, payable to the Franklin Institute. Mail should be addressed to Cleaner Air Symposium, The Franklin Institute, 20th and Parkway, Philadelphia 3.

Symposium on Faith and Healing.—The Section on Medical History, College of Physicians of Philadelphia, will present a symposium, "Faith and Healing: Origins of Psychosomatic Medicine," at the College Hall, 19 S. 22nd St., Oct. 9, 8:30 p. m. Dr. Lewis C. Scheffey, president of the college, will preside. Speakers will include Dr. Nicholas Padis, chairman, section on medical history, College of Physicians of Philadelphia; Dr. Kenneth E. Appel, professor of psychiatry, University of Pennsylvania School of Medicine; Dr. Edward Weiss, professor of clinical medicine, Temple University School of Medicine; and the Rev. Ernest Gordon, dean of The Chapel, Princeton (N. J.) University. All interested are welcome to attend.

Temple Establishes Psychiatric Institute.—Temple University Medical Center has announced plans to establish an institute of direct analysis to employ, for the first time on a large scale, a specialized approach to the treatment of schizophrenia. Dr. John N. Rosen, New York, who developed the direct analysis treatment method, based on a program of sustained psychotherapy in a controlled environment, and who was recently appointed associate professor of psychiatry at the medical center, will direct the training program. The Rockefeller Brothers Fund has pledged a total of $150,000 over a three-year period to establish the institute, under the direction of Dr. O. Spurgeon English, head of the department of psychiatry. The institute will consist of treatment units or dwellings decorated and arranged in the manner of private homes. Each unit will house about two patients and sufficient staff to offer round-the-clock treatment and companionship. Assistant therapists will live in the institute, and all members will eat at the "family" dining table. Each year the institute will offer a six-month training program to 30 psychiatrists and 30 talented nonmedical personnel as assistant therapists in the direct analysis technique. Patients will be accepted from the receiving station established by the mental health board at Philadelphia General Hospital, Temple University Medical Center, other institutions, and private sources. The program will begin, probably this fall, with the establishment of one unit. A second unit will be in operation six months later. Discharged patients will be followed for several months for treatment purposes and for at least 10 years for research purposes.

TEXAS

Assistant Director of Anderson Hospital.—Dr. David E. Liston has been appointed assistant director of the University of Texas M. D. Anderson Hospital and Tumor Institute, Houston, to succeed Dr. Roy C. Hellebower, who retired but will remain at the hospital as consultant on grants and special projects. During World War II, Dr. Liston was deputy chief surgeon of the European theater of operations. He has received the Legion of Merit and the Bronze Star with an Oak Leaf Cluster.

WISCONSIN

Dr. Banyai Awarded Medal.—Dr. Andrew L. Banyai, associate clinical professor of medicine, Marquette University School of Medicine, Milwaukee, was recently awarded the Carlo Forlanini gold medal of the Italian Federation Against Tuberculosis for the introduction of artificial pneumoperitoneum in the treatment of pulmonary tuberculosis. The medal was presented at the Fourth International Congress on Diseases of the Chest in Cologne, Germany, Aug. 19-23.

Dr. Simenstad Honored.—Dr. Lien O. Simenstad, president, State Medical Society of Wisconsin, was recently honored at a testimonial dinner by the community of Osceola, in which he has practiced for 32 years and which he has served as mayor since 1946. Dr. Simenstad is a member of the Wisconsin State Aeronautics Commission and chief of staff of the Ladd Memorial Hospital. Principal speakers at the dinner were Dr. Valentine C. Kremser of Amery, representing the Polk County Medical Society; Dr. Rolland H. Wilson, Winona, president of the Minnesota State Medical Association; Dr. William H. Hengstler, St. Paul; Mr. C. H. Crownhart, Madison, secretary, State Medical Society of Wisconsin; and Mr. Robert Paulson, president, Osceola Civic and Commerce Association.

GENERAL

Hospital Directors of Medical Education.—The Association of Hospital Directors of Medical Education was formally organized April 28 at Atlantic City, N. J., "to nurture the growth and development of sound programs of medical education in community hospitals." Inquiries about membership will be welcomed and should be directed to Dr. Henry S. M. Uhl, Director of Medical Education, Worcester City Hospital, Worcester, Mass.

Fiske Essay on Infertility.—The Caleb Fiske prize of the Rhode Island Medical Society ($350) is offered for a dissertation on "The Present Day Treatment of Infertility." It must be typewritten, double spaced, and should not exceed 10,000 words. Essays must be submitted by Jan. 10, 1957. For information write the Secretary, Caleb Fiske Fund, Rhode Island Medical Society, 106 Francis St., Providence 3, R. I.

Meetings on Plastic Surgery.—The American Otorhinologic Society for Plastic Surgery announces (1) a seminar on reconstruction and plastic surgical procedures of the ear at the Morrison Hotel, Chicago, Oct. 14, and (2) a course in plastic surgery of the head and neck at the Louisiana State University, New Orleans, Feb. 17-22, 1957, to include cadaver, didactic, and wet and dry clinics. Early registration is recommended because of the limited facilities. Information may be obtained from the secretary, Dr. Louis J. Feit, 66 Park Ave., New York 16.

St. Vincent Prize.—The Medical Academy of Turin, Italy, announces a competition for the second St. Vincent Prize for medical sciences. The prize (10 million lire—about $16,000), offered for papers published since 1950, is available to candidates proposed by at least 10 ordinary members of the academy, by the winner of the first St. Vincent Prize, by medical faculties of Italian universities, or by presidents of the most important foreign medical academies and faculties, invited by the president of the Medical Academy of Turin. Information may be obtained from the General Secretary, Prof. Angelo Allodi.

Facts on Tuberculosis.—According to a release from the National Tuberculosis Association, one-third of the people in the United States are infected with live tubercle bacilli. Nevertheless, the death rate has been reduced 95% since 1900, so that there are 10 deaths per 100,000 population today. However, tuberculosis kills 45 persons a day. The tuberculosis association finds that nearly 400,000 Americans are suffering from active tuberculosis, that about 100,000 new cases are being reported annually; that 50-60 million people in this country are tuberculin reactors, and that tuberculosis costs the United States 600 million dollars a year, largely in tax dollars.

Brochure on Industrial Safety.—A new volume of "Five-Minute Safety Talks for Foremen," published by the National Safety Council, contains 52 talks designed to build sound attitudes on accident prevention. Especially useful to foremen and supervisors, the talks provide outline and text for informal safety talks or scheduled training sessions. The talks include material on general topics, such as attitudes, lifting, and first aid, as well as information on specific problems including the use of power-actuated hand tools, masonry chipping, caustic chemicals, explosive dusts, flammable liquids, drills, saws, and electricity. For information write the National Safety Council, 425 N. Michigan Ave., Chicago 11.

Congenital Amputee Conference.—The 12th semiannual Congenital Amputee Conference will be held Oct. 13, 10 a. m. at the Kessler Institute for Rehabilitation, West Orange, N. J. This free diagnostic service is available to congenital amputee children through medical referral. The morning program will include an educational and orientation session regarding congenital malformations and principles of rehabilitation of the congenital amputee as well as films and demonstrations. In the afternoon, clinical examination of the children will be held. Lunch may be purchased at the institute. The conference is open to doctors, nurses, limb makers, therapists, and other rehabilitation personnel without charge. Those who plan to attend should register in advance with Mrs. Lucile Gould, Kessler Institute for Rehabilitation, West Orange, N. J., Redwood 1-3600.

Vermont-New Hampshire Medical Meeting.—The combined annual meeting of the Vermont State Medical Society (Dr. W. Douglas Lindsay, Montpelier, president) and the New Hampshire Medical Society (Dr. Louis C. Theobald, Exeter, president) will be held at Wentworth-by-the-Sea, Portsmouth, N. H., Oct. 7-9. The general sessions speakers will include:

Jere W. Lord, New York, Surgical Aspects of the Abdominal Aorta and Iliac Arteries.
Joshua B. Burnett, Hanover, N. H., Difficult Cases of Gout.
John P. Merrill, Boston, Current Concepts of the Pathogenesis and Treatment of Hypertension.
Ralph Adams, Wolfboro, N. H., Subclinical Adrenal Insufficiency.

The banquet speaker on Monday night, Allen R. Foley, Dartmouth College, Hanover, N. H., will have as his subject "Vermont Humor."

Gastroenterology Meeting.—The third annual convention of the American College of Gastroenterology will be held at the Roosevelt Hotel, New York, Oct. 15-17, and will be followed by a course in postgraduate gastroenterology, Oct. 18-20. Attendance at the postgraduate course is limited to those who have paid the matriculation fee. Panel discussions to be presented during the scientific sessions will include:

Diseases of the Esophagus, Charles B. Ripstein, New York (moderator); Irwin M. Arias, Anthony L. Danza, Milton Elkin, and Alfred A. Angrist, New York, participants.
Diseases of the Stomach and Duodenum, Linn J. Boyd, New York (moderator); George B. Glass, Ralph Colp, Frank J. Borrelli, and Francis D. Speer, New York, participants.
Esophageal Varices—Portal Hypertension, Hirsch R. Liebowitz, New York (moderator); Carl H. Greene, Brooklyn, Louis M. Rousselot, and Francis F. Ruzicka Jr., New York, participants.
Diseases of the Colon, Perrin H. Long, Brooklyn (moderator); Sidney M. Fierst, Irving F. Enquist, Harry Z. Mellins, and Patrick J. Fitzgerald, Brooklyn, participants.
Diseases of the Small Intestine, Michael J. Lepore, New York (moderator); Thomas P. Almy, Milton R. Porter, Louis A. Rottenberg, and Raffaele Lattes, New York, participants.
Diseases of the Gallbladder and Pancreas, William A. Barnes, New York (moderator); Michael Lake, Mary A. Payne, William F. Nickel Jr., John A. Evans, and John M. Pearce, New York, participants.

A question-and-answer period will follow each panel discussion. The luncheon, 12:30 p. m. Monday, will be sponsored by Burton, Parsons & Company. The banquet will be at 7:30 p. m. Tuesday at the Palm Terrace Suite of the Roosevelt Hotel. Twelve scientific papers will be presented. A motion picture program Wednesday, 8:30 p. m., will be preceded by presentation of the winning paper in the 1956 Ames award contest. Scientific and technical exhibits will be on display.

EXAMINATIONS AND LICENSURE

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 18-20. Sec., Dr. D. G. Gill, State Office Bldg., Montgomery 4.

Arizona:* *Examination and Reciprocity.* Phoenix, Oct. 17-19. Ex. Sec., Mr. Robert Carpenter, 411 Security Bldg., Phoenix.

Arkansas:* *Examination and Reciprocity. Little Rock, Nov. 8-9. Sec.,* Dr. Joe Verser, Harrisburg.

California: *Written Examination.* Sacramento, Oct. 15-18. *Oral Examination for Reciprocity Applicants* Los Angeles, Nov. 17. Sec., Dr. Louis E. Jones, 1020 N Street, Sacramento.

Colorado:* *Reciprocity.* Denver, Oct. 9. Final date for filing application was Sept. 10. *Examination.* Denver, Dec. 4-5. Final date for filing application is Nov. 2. Sec., Dr. Samuel H. Brown, 831 Republic Bldg., Denver 2.

Connecticut:* *Examination.* Hartford, Nov. 13-15. Sec., Dr. Creighton Barker, 160 St. Roman St., New Haven.

Delaware: *Examination.* Dover, Jan. 8-10. *Reciprocity.* Dover, Jan. 17. Sec., Dr. Joseph S. McDaniel, 225 So. State St., Dover.

District of Columbia:* *Examination.* Washington, Nov. 13-14. Deputy Director, Mr. Paul Foley, 1740 Massachusetts Ave., N.W., Washington 6.

Florida:* *Examination.* Miami Beach, Nov. 25-27. Sec., Dr. Homer L. Pearson, 901 N.W. 17th St., Miami 36.

Georgia: *Examination and Reciprocity.* Atlanta, Oct. 9-11. Sec., Mr. Cecil L. Clifton, 111 State Capitol, Atlanta 3.

Idaho: *Examination and Reciprocity.* Boise, Jan. 7-9. Exec. Sec., Mr. Armand L. Bird, 364 Sonna Bldg., Boise.

Iowa:* *Examination.* Des Moines, Dec. 3-5. Ex. Sec., Mr. Ronald V. Saf, State Office Bldg., Des Moines.

Kansas: *Examination and Endorsement.* Topeka, Dec. 12-13. Sec., Dr. Lyle F. Schmaus, 872 New Brotherhood Bldg., Kansas City.

Kentucky: *Examination.* Louisville, Dec. 10-12. Sec., Dr. Russell Teague, 620 South Third St., Louisville 2.

Louisiana: *Examination and Reciprocity.* New Orleans, Dec. 6-8. Sec., Dr. Edwin H. Lawson, *930 Hibernia Bank Bldg., New Orleans 12.*

Maine: *Examination and Reciprocity.* Portland, Nov. 13-14. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

Maryland: *Examination.* Baltimore, Dec. 11-14. Sec., Dr. Lewis P. Gundry, 1211 Cathedral St., Baltimore 1.

Massachusetts: *Examination.* Boston, Jan. 15-18. Sec., Dr. Robert C. Cochrane, State Office Bldg., Boston.

Michigan:* *Examination.* Lansing, Oct. 10-12. Sec., Dr. E. C. Swanson, 118 Stevens T. Mason Bldg., West Michigan Ave., Lansing 8.

Minnesota:* *Examination and Reciprocity.* Minneapolis, Oct. 16-18. Sec., Dr. F. H. Magney, 230 Lowry Medical Arts Bldg., St. Paul 12.

Mississippi: *Reciprocity.* Jackson, December. *Examination.* Jackson, June. Asst. Sec., Dr. R. N. Whitfield, Old Capitol, Jackson.

Missouri: *Examination and Reciprocity.* Kansas City, Oct. 25-27. Ex. Sec., Mr. John A. Hailey, Box 4, State Capitol Bldg., Jefferson City.

Nebraska:* *Examination.* Omaha, June 17-19. Director, Mr. Husted K. Watson, Room 1009, State Capitol Bldg., Lincoln 9.

New Jersey: *Examination.* Trenton, Oct. 16-19. Sec., Dr. Patrick H. Corrigan, 28 West State St., Trenton.

New Mexico:* *Examination and Reciprocity.* Santa Fe, Nov. 19-20. Sec., Dr. R. C. Derbyshire, 227 East Palace Ave., Santa Fe.

New York: *Examination.* Albany, Buffalo, New York City and Syracuse, Oct. 16-19. Sec., Dr. Stiles D. Ezell, 23 S. Pearl St., Albany.

North Dakota: *Examination and Reciprocity.* Grand Forks, Jan. 2-5. Sec., Dr. C. J. Glaspel, Grafton.

Oregon:* *Reciprocity.* Portland, Oct. 19-20. *Examination.* Portland, January. Ex. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland 4.

South Dakota:* *Examination.* Sioux Falls, Jan. 21-22. Ex. Sec., Mr. John C. Foster, 300 First National Bank Bldg., Sioux Falls.

Texas:* *Examination and Reciprocity.* Fort Worth, Dec. 6-8. Applications for reciprocity must be complete and on file at least thirty days prior to the December meeting, and applications for examination must be complete and on file at least ten days prior to the meeting date. Sec., Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth 2.

Utah: *Reciprocity.* Salt Lake City, Nov. 20. *Examination.* Salt Lake City, July 11-13. Director, Mr. Frank E. Lees, 324 State Capitol Bldg., Salt Lake City 1.

Virginia: *Examination and Reciprocity.* Richmond, Dec. 5-7. Address: Secretary to the Board, 631 First St., S.W., Roanoke.

Washington:* *Examination and Reciprocity.* Seattle, Jan. 14-16 and Jan. 12. Sec., Mr. Edward C. Dohm, Olympia.

West Virginia: *Reciprocity.* Charleston, Oct. 8. *Examination.* Charleston, January. Sec., Dr. Newman H. Dyer, State Office Building No. 3, Charleston 5.

Wisconsin:* *Reciprocity.* Madison, Oct. 19 and Jan. 9. *Examination.* Madison, Jan. 8-10. Sec., Dr. Thomas W. Tormey, Jr., 1140 State Office Bldg., 1 West Wilson St., Madison.

Alaska:* On application in Anchorage, Fairbanks, Juneau and other towns. Sec., Dr. W. M. Whitehead, 172 South Franklin St., Juneau.

Guam: *Subject to Call.* Act. Sec., Dr. S. F. Provencher, Agana.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Colorado. *Examination and Reciprocity.* Dec. 5-6, Lincoln and Denver. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver 18.

Connecticut. *Examination.* New Haven, Oct. 13. Exec. Asst., Miss Regina G. Brown, 258 Bradley St., New Haven 10.

District of Columbia. *Examination.* Washington, Oct. 22-23. Deputy Director, Mr. Paul Foley, 1740 Massachusetts Ave., N.W., Washington.

Iowa. *Examination.* Des Moines, Oct. 9. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination and Reciprocity.* Ann Arbor and Detroit, Oct. 12-13. Sec., Mrs. Anne Baker, 116 Stevens T. Mason Bldg., Lansing.

New Mexico: *Examination. Santa Fe, Oct. 21. Sec., Mrs. Marguerite* Cantrell, Box 1522, Santa Fe.

Oregon: *Examination.* Portland, Dec. 1. Dr. Earl M. Palett, Sec., State Board of Higher Education, Eugene.

South Dakota: *Examination.* Vermillion, Dec. 7-8. Sec., Dr. Gregg M. Evans, 310 E. 15th St., Yankton.

Texas: *Examination.* Austin and Houston, Oct. 19-20. Sec., Bro. Raphael Wilson, 407 Perry-Brooks Bldg., Austin.

Washington: *Examination.* Seattle, Jan. 9-10. Sec., Mr. Edward C. Dohm, Olympia.

Wisconsin: *Examination.* Milwaukee, Dec. 1. Sec., Dr. W. H. Barber, 621 Ransom St., Ripon.

Alaska: *Examination and Reciprocity.* Anchorage and Juneau, first week of February, April, June, August and November. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

---

*Basic Science Certificate required.

Symposium on Faith and Healing.—The Section on Medical History, College of Physicians of Philadelphia, will present a symposium, "Faith and Healing: Origins of Psychosomatic Medicine," at the College Hall, 19 S. 22nd St., Oct. 9, 8:30 p. m. Dr. Lewis C. Scheffey, president of the college, will preside. Speakers will include Dr. Nicholas Padis, chairman, section on medical history, College of Physicians of Philadelphia; Dr. Kenneth E. Appel, professor of psychiatry, University of Pennsylvania School of Medicine; Dr. Edward Weiss, professor of clinical medicine, Temple University School of Medicine; and the Rev. Ernest Gordon, dean of The Chapel, Princeton (N. J.) University. All interested are welcome to attend.

Temple Establishes Psychiatric Institute.—Temple University Medical Center has announced plans to establish an institute of direct analysis to employ, for the first time on a large scale, a specialized approach to the treatment of schizophrenia. Dr. John N. Rosen, New York, who developed the direct analysis treatment method, based on a program of sustained psychotherapy in a controlled environment, and who was recently appointed associate professor of psychiatry at the medical center, will direct the training program. The Rockefeller Brothers Fund has pledged a total of $150,000 over a three-year period to establish the institute, under the direction of Dr. O. Spurgeon English, head of the department of psychiatry. The institute will consist of treatment units or dwellings decorated and arranged in the manner of private homes. Each unit will house about two patients and sufficient staff to offer round-the-clock treatment and companionship. Assistant therapists will live in the institute, and all members will eat at the "family" dining table. Each year the institute will offer a six-month training program to 30 psychiatrists and 30 talented nonmedical personnel as assistant therapists in the direct analysis technique. Patients will be accepted from the receiving station established by the mental health board at Philadelphia General Hospital, Temple University Medical Center, other institutions, and private sources. The program will begin, probably this fall, with the establishment of one unit. A second unit will be in operation six months later. Discharged patients will be followed for several months for treatment purposes and for at least 10 years for research purposes.

TEXAS

Assistant Director of Anderson Hospital.—Dr. David E. Liston has been appointed assistant director of the University of Texas M. D. Anderson Hospital and Tumor Institute, Houston, to succeed Dr. Roy C. Hellebower, who retired but will remain at the hospital as consultant on grants and special projects. During World War II, Dr. Liston was deputy chief surgeon of the European theater of operations. He has received the Legion of Merit and the Bronze Star with an Oak Leaf Cluster.

WISCONSIN

Dr. Banyai Awarded Medal.—Dr. Andrew L. Banyai, associate clinical professor of medicine, Marquette University School of Medicine, Milwaukee, was recently awarded the Carlo Forlanini gold medal of the Italian Federation Against Tuberculosis for the introduction of artificial pneumoperitoneum in the treatment of pulmonary tuberculosis. The medal was presented at the Fourth International Congress on Diseases of the Chest in Cologne, Germany, Aug. 19-23.

Dr. Simenstad Honored.—Dr. Lien O. Simenstad, president, State Medical Society of Wisconsin, was recently honored at a testimonial dinner by the community of Osceola, in which he has practiced for 32 years and which he has served as mayor since 1946. Dr. Simenstad is a member of the Wisconsin State Aeronautics Commission and chief of staff of the Ladd Memorial Hospital. Principal speakers at the dinner were Dr. Valentine C. Kremser of Amery, representing the Polk County Medical Society; Dr. Rolland H. Wilson, Winona, president of the Minnesota State Medical Association; Dr. William H. Hengstler, St. Paul; Mr. C. H. Crownhart, Madison, secretary, State Medical Society of Wisconsin; and Mr. Robert Paulson, president, Osceola Civic and Commerce Association.

GENERAL

Hospital Directors of Medical Education.—The Association of Hospital Directors of Medical Education was formally organized April 28 at Atlantic City, N. J., "to nurture the growth and development of sound programs of medical education in community hospitals." Inquiries about membership will be welcomed and should be directed to Dr. Henry S. M. Uhl, Director of Medical Education, Worcester City Hospital, Worcester, Mass.

Fiske Essay on Infertility.—The Caleb Fiske prize of the Rhode Island Medical Society ($350) is offered for a dissertation on "The Present Day Treatment of Infertility." It must be typewritten, double spaced, and should not exceed 10,000 words. Essays must be submitted by Jan. 10, 1957. For information write the Secretary, Caleb Fiske Fund, Rhode Island Medical Society, 106 Francis St., Providence 3, R. I.

Meetings on Plastic Surgery.—The American Otorhinologic Society for Plastic Surgery announces (1) a seminar on reconstruction and plastic surgical procedures of the ear at the Morrison Hotel, Chicago, Oct. 14, and (2) a course in plastic surgery of the head and neck at the Louisiana State University, New Orleans, Feb. 17-22, 1957, to include cadaver, didactic, and wet and dry clinics. Early registration is recommended because of the limited facilities. Information may be obtained from the secretary, Dr. Louis J. Feit, 66 Park Ave., New York 16.

St. Vincent Prize.—The Medical Academy of Turin, Italy, announces a competition for the second St. Vincent Prize for medical sciences. The prize (10 million lire—about $16,000), offered for papers published since 1950, is available to candidates proposed by at least 10 ordinary members of the academy, by the winner of the first St. Vincent Prize, by medical faculties of Italian universities, or by presidents of the most important foreign medical academies and faculties, invited by the president of the Medical Academy of Turin. Information may be obtained from the General Secretary, Prof. Angelo Allodi.

Facts on Tuberculosis.—According to a release from the National Tuberculosis Association, one-third of the people in the United States are infected with live tubercle bacilli. Nevertheless, the death rate has been reduced 95% since 1900, so that there are 10 deaths per 100,000 population today. However, tuberculosis kills 45 persons a day. The tuberculosis association finds that nearly 400,000 Americans are suffering from active tuberculosis, that about 100,000 new cases are being reported annually; that 50-60 million people in this country are tuberculin reactors, and that tuberculosis costs the United States 600 million dollars a year, largely in tax dollars.

Brochure on Industrial Safety.—A new volume of "Five-Minute Safety Talks for Foremen," published by the National Safety Council, contains 52 talks designed to build sound attitudes on accident prevention. Especially useful to foremen and supervisors, the talks provide outline and text for informal safety talks or scheduled training sessions. The talks include material on general topics, such as attitudes, lifting, and first aid, as well as information on specific problems including the use of power-actuated hand tools, masonry chipping, caustic chemicals, explosive dusts, flammable liquids, drills, saws, and electricity. For information write the National Safety Council, 425 N. Michigan Ave., Chicago 11.

Congenital Amputee Conference.—The 12th semiannual Congenital Amputee Conference will be held Oct. 13, 10 a. m. at the Kessler Institute for Rehabilitation, West Orange, N. J. This free diagnostic service is available to congenital amputee children through medical referral. The morning program will include an educational and orientation session regarding congenital malformations and principles of rehabilitation of the congenital amputee as well as films and demonstrations. In the afternoon, clinical examination of the children will be held. Lunch may be purchased at the institute. The conference is open to doctors, nurses, limb makers, therapists, and other rehabilitation person-

Darling, Charles Gilchrist, Evanston, Ill.; National Medical University, Chicago, 1899; Northwestern University Medical School, Chicago, 1903; clinical professor of ophthalmology emeritus (Rush), University of Illinois College of Medicine; specialist certified by the American Board of Ophthalmology; past-president and secretary of the Chicago Ophthalmological Society; served on the staffs of the Cook County and Presbyterian hospitals in Chicago; died Aug. 8, aged 78.

Doyle, William Joseph, Bear Creek, Pa.; Jefferson Medical College of Philadelphia, 1912; past-president of the Luzerne County Medical Society; an associate member of the American Medical Association; fellow of the American College of Surgeons; served overseas during World War I; on the staff of the Mercy Hospital, Wilkes-Barre, where he died June 28, aged 70.

Epstein, Harry Jay ⊕ Philadelphia; Temple University School of Medicine, Philadelphia, 1931; on the faculty of the Hahnemann Medical College and Hospital; specialist certified by the American Board of Internal Medicine; on the staff of the Albert Einstein Medical Center–Southern Division, where he died July 9, aged 54, of coronary heart disease.

Eshoo, Samuel O., Turlock, Calif.; Queen's University Faculty of Medicine, Kingston, Ontario, Canada, 1902; died June 4, aged 80, of heart disease.

Fisher, Harold Lionel, Brawley, Calif.; University of Oregon Medical School, Portland, 1942; served during World War II; interned at San Diego County General Hospital in San Diego; formerly a resident in pathology at the Veterans Administration Center in Los Angeles; died in the Veterans Administration Hospital in San Fernando June 27, aged 43, of cor pulmonale and tuberculosis.

Fitzgerald, Edmond William ⊕ Port Huron, Mich.; St. Louis University School of Medicine, St. Louis, 1925; veteran of World War II; on the staff of the Port Huron Hospital; died July 8, aged 55, of heart disease.

Fix, Carroll Clinton, Bedford, Ky.; Hospital College of Medicine, Louisville, 1906; formerly practiced in Louisville, where he was on the staffs of the Jewish Hospital and the SS. Mary and Elizabeth Hospital; died in the Kentucky Baptist Hospital in Louisville June 7, aged 73, of a popliteal aneurysm and coronary occlusion.

Fox, Ann Margaret, Los Angeles; New York Medical College, Flower and Fifth Avenue Hospitals, New York City, 1943; certified by the National Board of Medical Examiners; an associate member of the American Medical Association; interned at the New York University Post-Graduate Medical School and Hospital in New York City, where she served a residency; formerly a resident in pediatrics and contagious diseases at the Children's Hospital in San Francisco; died July 22, aged 40.

Gannon, Francis James ⊕ Cleveland; St. Louis University School of Medicine, St. Louis, 1935; member of the Cleveland Academy of Medicine; on the staffs of St. John's, St. Alexis, and Marymount hospitals; died July 9, aged 47, of carcinoma of the right lung.

Garlock, Arthur Varney ⊕ Bemidji, Minn.; Northwestern University Medical School, Chicago, 1910; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology; served as mayor of Bemidji; on the staff of the Lutheran Hospital; for five years president of the Bemidji Park Board; died June 25, aged 71.

Gordner, Jesse Walter ⊕ Jerseytown, Pa.; Jefferson Medical College of Philadelphia, 1909; on the courtesy staff of the Bloomsburg (Pa.) Hospital; died July 3, aged 72, of carcinoma of the lung.

Gosztonyi, William ⊕ Pittsburgh; Magyar Királyi Pázmány Petrus Tudományegyetem Orvosi Fakultasa, Budapest, Hungary, 1914; during World War II held a rank in the Hungarian Army; on the staffs of the St. Margaret Memorial Hospital, where he served an internship, and the Montefiore Hospital, where he died June 28, aged 69, of acute myocardial infarction and cerebral hemorrhage.

Gray, Edmund Coleman, Rochester, N. Y.; Bennett Medical College, Chicago, 1914; associated with the MacFadden Center in Dansville; died July 6, aged 72, of cancer.

Haagen, Louis C., St. Louis; Barnes Medical College, St. Louis, 1899; retired pharmacist; died in St. Luke's Hospital June 17, aged 91, of arteriosclerosis.

Hales, Jesse Collins ⊕ Gardner, Mass.; Tufts College Medical School, Boston, 1924; interned at the Cambridge (Mass.) City Hospital; past-president of the Worcester North District Medical Society; for many years school physician; served during World Wars I and II; on the staff of the Henry Heywood Memorial Hospital; died in the Veterans Administration Hospital, Brockton, June 17, aged 58, of cardiovascular-renal disease and tuberculosis.

Halverson, Henry Ludwig, Minot, N. D.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, Chicago, 1904; past-president of the North Dakota Health Officers Association; served as county health officer; died June 6, aged 76.

Hammack, John A., Kennedale, Texas (licensed in Texas under the Act of 1907); died July 3, aged 92, of cerebral vascular accident.

Hartigan, Francis Xavier ⊕ St. Joseph, Mo.; Ensworth Medical College, St. Joseph, 1910; in 1939 president of the Buchanan County Medical Society; formerly vice-president of the St. Joseph Clinical Society; fellow of the American College of Surgeons; president of the St. Joseph Health Board from 1938 to 1946; served in France during World War I; on the staffs of the Missouri Methodist Hospital, State Hospital no. 2, and St. Joseph's Hospital, where he died June 9, aged 67, of acute necrotizing tracheobronchitis.

Hawthorne, Grace Maude, Nevada, Iowa; University of Illinois College of Medicine, Chicago, 1916; died June 17, aged 75.

Hayes, Julius Poe ⊕ Clanton, Ala.; Memphis (Tenn.) Hospital Medical College, 1896; died June 30, aged 86, of arteriosclerosis.

Herbert, Alpha Nathan, Miami, Fla.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1925; city physician; died in Ellicott City, Md., June 22, aged 55, of abdominal aneurysm.

Heyer, Harold Hankinson ⊕ New London, Conn.; University of the City of New York Medical Department, New York City, 1887; for many years member of the school board; died June 13, aged 92, of arteriosclerotic cardiovascular disease.

Hickman, Clarence Clyde, Lincoln, Neb.; Rush Medical College, Chicago, 1910; veteran of World War I; served on the staff of the Lincoln General Hospital; died June 13, aged 72.

Hill, Charles Byron, Guthrie, Okla.; University Medical College of Kansas City, Mo., 1899; an associate member of the American Medical Association; veteran of Spanish American War; served as a member of the school board; died June 26, aged 84, of cerebral hemorrhage.

Hills, Louis Lenville ⊕ Westbrook, Maine; Medical School of Maine, Portland, 1903; died June 9, aged 79, of arteriosclerosis.

Hoffman, Charles Earle, San Mateo, Calif.; John A. Creighton Medical College, Omaha, 1914; died July 10, aged 67, of uremia and heart disease.

Hoffses, Granville Ernest ⊕ Manchester, N. H.; Boston University School of Medicine, Boston, 1898; veteran of World War I; served on the staff of the Elliot Hospital; at one time practiced in Dedham, Mass., where he was on the school committee; died June 27, aged 83.

Hogeboom, George Hall, Bethesda, Md.; Johns Hopkins University School of Medicine, Baltimore, 1939; conducted fundamental research in cell chemistry at the National Institutes of Health, where he was chief of the cellular biology section of the National Cancer Institute; for many years associated with the Rockefeller Institute for Research in New York City; died in the Central Dispensary and Emergency Hospital, Washington, D. C., July 5, aged 43.

Hubbard, Clinton De Witt, Manhattan Beach, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1891; an associate member of the American Medical Association; formerly practiced in Huntington Park, where he was city councilman; died June 28, aged 90, of carcinoma of the lower end of esophagus.

Humphrey, David W., Los Angeles; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1905; died in the Glendale (Calif.) Sanitarium and Hospital June 21, aged 78, of coronary thrombosis.

Hustead, Edwin L. ⊕ Los Angeles; John A. Creighton Medical College, Omaha, 1912; on the staffs of the Santa Monica and St. John's hospitals in Santa Monica; died June 11, aged 70.

Inman, Bruce B., Keota, Okla.; University of Arkansas School of Medicine, Little Rock, 1913; died June 12, aged 71, of coronary occlusion.

Keim, Albert L., Pittsburgh; Baltimore Medical College, Baltimore, 1913; died July 28, aged 71.

Latimer, Thomas Edwin, Hyattsville, Md.; University of Maryland School of Medicine, Baltimore, 1907; served on the staff of the Sibley Memorial Hospital, Washington, D. C.; died in the Prince George's General Hospital in Cheverly, July 20, aged 82, of carcinoma of the stomach.

Lease, Henry Joseph ⊕ North Bergen, N. J.; Columbia University College of Physicians and Surgeons, New York City, 1926; served as assistant police surgeon; on the staff of the North Hudson Hospital in Weehawken; died in the Christ Hospital, Jersey City, June 29, aged 56, of cirrhosis of the liver.

Loomis, DeWitt, Boonville, Ind.; Chicago College of Medicine and Surgery, 1912; served overseas in France during World War I; died June 24, aged 70, of cerebral hemorrhage.

MacDonald, William Campbell ⊕ Malden, Mass.; Colorado School of Medicine, Boulder, 1895; served on the staff of the Malden Hospital, where he was chairman emeritus of the medical board; died in the Melrose (Mass.) Hospital June 24, aged 90, of jaundice.

Mackey, John Frederick ⊕ La Jolla, Calif.; University Medical College of Kansas City, Mo., 1904; member of the Colorado State Medical Society; veteran of World War I; formerly practiced in Denver, where he was on the staffs of the Porter Sanitarium and Hospital and the General Rose Memorial Hospital; died June 19, aged 80, of myocardial infarction.

Mantle, William B. ⊕ Albion, Iowa; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1902; died May 17, aged 83, of chronic myocarditis.

Marchant, J. Henry, Baltimore; University of Maryland School of Medicine, Baltimore, 1891; also a dentist; died July 2, aged 86.

Marczak, Clement Stanislaw, Lockport, Ill.; Chicago Medical School, 1930; died in Chicago May 29, aged 67.

Marra, Rocco Salvatore ⊕ Orange, N. J.; George Washington University School of Medicine, Washington, D. C., 1925; served as examining physician for the New Jersey National Guard; chief anesthetist at the Doctors Hospital and on the staffs of St. Michael's and Columbus hospitals in Newark, and St. Mary's Hospital; died July 4, aged 57, of Paget's disease and sarcoma.

Marshall, William Hill, Milwaukee; Meharry Medical College, Nashville, Tenn., 1903; died in the Milwaukee County Hospital June 12, aged 80, of bronchopneumonia and arteriosclerosis.

Mathews, Paul Girard ⊕ Walsenburg, Colo.; University of Colorado School of Medicine, Denver, 1908; past-president of the Huerfano County Medical Society; died in Colorado Springs June 21, aged 70, of pneumonia and lung cancer.

McClellan, Frederick Coe ⊕ Canandaigua, N. Y.; University of Buffalo School of Medicine, Buffalo, 1917; fellow of the American College of Surgeons; health officer; veteran of World War I; on the staff of the Frederick Ferris Thompson Hospital; died in the Genesee Hospital, Rochester, July 4, aged 62, of acute myocardial infarction.

McGary, Joseph Richard, Evansville, Ind.; Kentucky School of Medicine, Louisville, 1902; veteran of World War I; member of the staff of the Owensboro-Daviess County Hospital in Owensboro, Ky.; died June 23, aged 79, of arteriosclerosis.

McKinstray, Homer R. ⊕ Indianapolis; Indiana Medical College, School of Medicine of Purdue University, Indianapolis, 1906; taught orthopedics at the Indiana University School of Medicine; served on the staffs of the Methodist and Indianapolis General hospitals; died June 21, aged 76, of arteriosclerosis.

Meadows, Matthew Warnack ⊕ Fullerton, Ky.; Eclectic Medical Institute, Cincinnati, 1904; died June 4, aged 87.

Myers, Robert Douglas ⊕ Columbus, Ohio; Ohio State University College of Medicine, Columbus, 1926; member of the American Society of Anesthesiologists; veteran of World War II; an anesthetist at Mount Carmel Hospital; died June 19, aged 55, of coronary occlusion.

Neher, Charles Kendal ⊕ Cleveland; University of Chicago, the School of Medicine, 1934; interned at Miami Valley Hospital in Dayton, Ohio; formerly a resident at the Barnes Hospital in St. Louis; on the staffs of the Grace and Fairview Park hospitals; died in Sandusky, Ohio, June 24, aged 51, in a plane crash.

Neill, William, Jr., Baltimore; Johns Hopkins University School of Medicine, Baltimore, 1912; an associate member of the American Medical Association; fellow of the American College of Surgeons; served in the British and American armies during World War I; instructor in surgery at his alma mater; on the staffs of the Church Home and Hospital, Hospital for Women, Union Memorial Hospital, Maryland General Hospital, and St. Joseph's Hospital; consultant, Cambridge-Maryland Hospital in Cambridge; died in the Johns Hopkins Hospital June 24, aged 68, of cerebrovascular accident.

Nunn, Joshua Hugh ⊕ Dyersburg, Tenn.; University of Tennessee College of Medicine, Memphis, 1929; veteran of World War II; died in the Baptist Memorial Hospital in Memphis June 26, aged 51.

Nye, Luther A., Okemah, Okla.; University of Tennessee Medical Department, Nashville, 1896; past-president of the Okfuskee County Medical Society; served on the city council; died June 19, aged 81.

Palmer, King Paige, Holdrege, Neb.; Eclectic Medical College, Cincinnati, 1918; died in the Hastings State Hospital in Ingleside May 28, aged 64, of bronchopneumonia.

Park, George, Blacksville, W. Va.; Jefferson Medical College of Philadelphia, 1928; died July 7, aged 55.

Parker, William Henry ⊕ Richmond, Va.; University College of Medicine, Richmond, 1895; named Virginia commissioner for the Amateur Athletic Union in 1923; served as president of the Richmond Baseball team, and one of Richmond's athletic fields was named in his honor; a member and chairman of the city electoral board and had been medical director of the Mutual Life Insurance Company of Virginia since 1925; died June 13, aged 82, of parkinsonian disease.

Portz, Wade Russell ⊕ Hartville, Ohio; Ohio State University College of Medicine, Columbus, 1929; member of the American Academy of General Practice; accidentally drowned when he fell out of his boat while fishing June 23, aged 53.

INDIA

Health Insurance Scheme in Delhi.—The rapid increase in the attendance of patients at the dispensaries run under the contributary health service scheme bears testimony to the growing popularity and usefulness of this pilot experiment, according to the report on the scheme published by the Union Health Ministry. The report reveals that, while the daily average attendance at the dispensaries in Delhi and New Delhi in the first month of its operation (July, 1954) was 3,936, it rose to 8,292 in the last week of July, 1955. The number of beneficiaries, including government servants and their families and dependents, also increased from 223,000 to 273,844 in the same period. A significant feature of the scheme is that it has done away with the distinction between classes of government servants in the matter of free medical attendance and treatment. A compulsory monthly contribution on a graded scale is levied on all government employees registered under the scheme.

Treatment of Drug-Resistant Pulmonary Tuberculosis.—Takaro and Dey (*Indian Journal of Tuberculosis*, June, 1956) report that cyanacetic acid hydrazide resembles isoniazid except for substitution of the pyridine ring in the isoniazid for an aliphatic ring. It was thought that this alteration would reduce the toxicity while maintaining the antimicrobial activity. Seventeen patients who had far-advanced bilateral pulmonary tuberculosis with cavities in the lungs and sputum positive for acid-fast bacilli, in spite of previous specific antitubercular treatment, were selected for trial. The criteria by which the value of the drug was assessed were (1) changes in body weight, (2) acid-fast bacilli in the sputum, (3) number and size of cavities and clearing noncavitary infiltration, and (4) present status of disease (whether active, arrested, or inactive). The average duration of disease before start of treatment was 40 months. The age of the patients varied from 16 to 64. All had had pneumoperitoneum and some had had artificial pneumothorax or thoracoplasty. Three had had a course of viomycin combined with oxytetracycline and several had thiosemicarbazone, in addition to streptomycin, aminosalicylic acid, and isoniazid. The average dose of the new drug was 7.5 mg. per kilogram of body weight continued for an average period of six months. The authors concluded that there was no clear-cut evidence that the drug is effective in these patients. Paresthesia, with tingling, soreness, and burning of legs and feet, was the most common toxic symptom.

Training Center in Ayur-Veda.—The Union Health Minister, at the opening of the postgraduate training center in Jamnagar in July, said that this institution was a logical sequel to the establishment of the Central Institute of Research in Indigenous Systems of Medicine three years ago. In selecting Jamnagar for the location of this institute, the government was principally guided by the facilities already available there, including abundant accommodation, the presence of an excellent library relating to both indigenous and modern systems of medicine, a herbarium, a department of pharmacy, and the possibility of active collaboration with a modern medical college. A postgraduate training institution should work in close association with the center for the promotion of active research if the quality of teaching is to be sufficiently high. Moreover, the bringing together of a body of highly specialized exponents of Ayur-Veda and their active collaboration with those trained in modern medicine toward the formulation of an active research program is in itself an innovation. Research in Ayur-Veda should be carried out on two separate lines. The first is the study of the fundamental principles and practices of Ayur-Veda, and the second is investigation into the vast body of drugs that this system possesses. Fundamental research in Ayur-Veda is already in progress at the Jamnagar Research Institute. Here the diagnosis and treatment of a patient are carried out on strictly ayurvedic lines while a team of practitioners of modern medicine record the pathological and clinical tests necessary for the evaluation of results. The data thus collected will provide the basis for attempting a proper interpretation of the fundamental concepts of the ayurvedic system. Plans for the next five years provide for a wide expansion of drug research. Ayur-Veda has its own pharmacopeia based on a wide variety of herbal remedies. In the past 30 years many studies have been carried out to assess the pharmacological properties of the more widely used ayurvedic drugs.

Artificial Hibernation.—P. K. Sen and co-workers (*Indian J. Surg.* 18:114, 1956) stated that the chilled heart is especially likely to go into ventricular fibrillation and other arrhythmias. Hypoxia, carbon dioxide retention, and changes in the serum potassium level have been incriminated in turn. Observations by the authors indicate that hypoxia could not be a major factor. It has been shown by other workers that hyperventilation prevents ventricular fibrillation, while an excess of carbon dioxide in the blood makes the heart susceptible to this form of arrythmia. Lowering of the serum potassium level was observed in the chilled hyperventilated dogs. The authors used a standard method of production of ventricular fibrillation in hypothermia based on the delivering of a standard hormonal insult to a chilled heart at a definite temperature and in a standard state of anoxia. Healthy dogs were given 3 ml. of a 1:20,000 solution of epinephrine and the temperature, electrocardiogram, and the levels of serum proteins, sugar, carbon dioxide, sodium, and potassium were checked. The most significant change in these animals was observed in the potassium level, which consistently dropped. Hypersensitivity of the myocardium at low temperatures is in some way concerned with a rise in carbon dioxide and a fall in serum potassium levels. According to the authors, injecting epinephrine into a chilled anoxic heart provides a standard method of producing ventricular fibrillation. The best remedy for this condition proved to be rapid manual compression of the heart accompanied by maintenance of full oxygenation. Intracardiac injection of potassium is ineffective, and the use of electric shock was also disappointing.

Vascular Occlusions.—Ramamurthi in *Neurology* (April-June, 1956) stated that vascular occlusions in the posterior cranial fossa are not uncommon, although they are rare when compared to cerebral vascular lesions elsewhere. The neurological findings are not constant even if the same blood vessel is involved, due to variations in collateral circulation and the frequent occurrence of anomalies in the arterial supply of the hindbrain. The author reports 22 cases encountered in five years, as compared to 650 cerebral vascular accidents met with in the same period. The vessels involved were the posterior inferior cerebellar artery or its branches, the vertebral artery, the basilar artery, the anterior inferior cerebellar artery, the anterior spinal artery, and arteries supplying the midbrain, in that order. The predilection for involvement of the posterior inferior cerebellar artery, may be due to its large size or its long and tortuous course. The vascular occlusions may be caused by trauma, such infections as syphilis and tuberculosis, thromboangiitis, arteriosclerosis, or hypertension. The commonest cause is hypertension. The prognosis has been uniformly good. The almost complete recovery occurring in many patients is in contrast to the results of complete thrombosis. Spasm of the vessel is a plausible explanation, especially in patients with arteriosclerosis and hypertension. In younger patients such syndromes have occurred without any definite cause. In one young girl it followed an attack of coryza. Aneurysms of the vessels with leak or partial thrombosis may be responsible.

PERU

Tuberculosis.—In *Revista peruana de salud pública* (vol. 4, no. 7, 1955) Dr. Brouncle Carrión, in a survey of the death rates from tuberculosis in the principal Peruvian cities, classifies the cities with available records into three groups: those with increasing, those with stationary, and those with decreasing rates

---

The items in these letters are contributed by regular correspondents in the various foreign countries.

of tuberculosis infection. He concluded that, epidemiologically, tuberculosis presents different characteristics from one city to another and that a massive infection of the population is likely to occur in the coming years unless appropriate measures are adopted promptly. The cities in the Andean region showed increasing death rates and trend curves similar to those observed in the cities near or on the coast 25 years ago that now show decreasing death rates and trend curves. The death rate of Arequipa, however, one of the highest in the country, showed a slow, steady decrease throughout the last 20 years. Another high-altitude city with an even greater drop in the death rate was Jauja. This can be explained by the fact that this city, although up to few years ago a traditional hotbed of tuberculosis, possessed the first tuberculosis sanatorium because of its excellent climate. On the other hand, Moyomamba and Iquitos, two large cities in the jungle, show an ascending death rate, unlike that of other cities of the same region.

SWITZERLAND

Cortisone and Prednisone.—At the Congress of Swiss Internists, Dr. Fabre said that, in treating patients with edema in whom resistance to usual treatments cannot be explained, and especially when a hyponatremia exists, he gives 40 mg. of prednisone daily. Sometimes the diuretic influence of prednisone is not felt, but the hormone reactivates diuretics that have lost their effect. Adrenal hormones should never be given to patients with edema if it is not possible to obtain a rigidly salt-poor diet. Even with prednisone, of which the action on salt is much more moderate than that of cortisone, the possibility of sodium retention cannot be excluded. The mode of action of these hormones is not yet understood, but it is probably different in different persons. Whatever the mode, the following properties of cortisone and prednisone are beneficial: 1. They stimulate aqueous diuresis by hemodilution; here cortisone acts as an antagonist of the antidiuretic posthypophyseal hormone. 2. They increase the glomerular filtrate, thus assisting spontaneous diuresis and the response to the diuretics acting on the tubules. 3. They limit the permeability of the membranes to the protein causing a reduction of the albuminuria evident in patients with nephrosis and of the protein transudation through capillary membranes. 4. They seem in certain patients to inhibit the secretion of the aldosterone, which is responsible for the tubular resorption of sodium.

Hypersplenism.—At the same meeting Gelin of Oran said that, if a patient's chief complaint is his abdominal enlargement, a hemogram should be obtained. This will indicate whether the splenomegaly is associated with a disturbance of the blood-forming organs. If the chief symptoms suggest a cytopenia, careful clinical examination will allow appraisal of the degree of responsibility of the spleen for this condition. Medical treatment consisting of blood transfusions, cortisone, and antibiotics should be tried for 10 days. If there is no improvement, the patient should be sent to a surgeon.

Carbutamide.—At the same meeting Bonhote and Constam of Zurich said that the blood sugar is maintained at a constant level through the hyperglycemic action of glucagon, epinephrine, the glucocorticoids, and somatotropin and the hypoglycemic action of insulin. The results show that the hypoglycemic action of such compounds as carbutamide is not exercised by inhibiting the adrenal cortex or the anterior lobe of the pituitary. Results also show that these compounds do not act on exogenous glucagon, nor do they inhibit the formation of glucose in the liver. The hypoglycemic effect of carbutamide appears to be due to an enzymatic inhibitory action on insulinase. Hofstetter and Ramel of Lausanne treated 84 diabetics with carbutamide for two to five months; 71 patients reacted favorably, but the conditions of 13 were resistant to this treatment. It was found that the percentage of successes increases with the age of the patients and the thin diabetic reacts less well to the drug than does the fat diabetic. Ten patients showed cutaneous allergic reactions. The change from insulin to carbuamide is possible on an ambulatory basis, provided the patient is frequently observed and the insulin doses are decreased gradually.

Symposium on the Spleen.—At a meeting of the Swiss Academy of Medical Sciences, K. Bernhard of Basel said that in a patient with lipid histiocytosis he observed a definite increase in the total lipids owing to an increase in cholesterol, while the neutral fats and the fatty acids remained unchanged. Experiments on spleens nourished with fatty acids not present in the daily diet showed by the recovery of these fatty acids in the spleen that this organ actively participates in the metabolism of nutritive fats. A. Vannotti of Lausanne, using radioactive iron (Fe^{59}), showed that altitude, anemia, hyperthyroidism, and acute infections diminish deposits of iron in the liver at the expense of the marrow, without notably modifying the rate of Fe^{59} circulating in the blood except in the course of acute infections; when it is moderately decreased. The concentration of iron in the spleen remains constant. Six or seven days after an intravenous injection of Fe^{59}, all of the Fe^{59} may be recovered from the erythrocytes, while its concentration, which was relatively high during the first five days, decreases progressively in the marrow, liver, and spleen. During the course of hemolytic anemias, after three days all the Fe^{59} may be recovered from the erythrocytes and in the following days the concentration of Fe^{59} in the spleen progressively increases, which is not normally the case. The author believes that, with intravenous use of Fe^{59}, the indications for splenectomy can be specified and, especially in patients with osteosclerosis myelofibrosis (when the marrow takes up practically no Fe^{59}), removal of a spleen that has just taken over the deficient hematopoietic function of the marrow should be avoided.

Hydrocortisone and Prednisone in Pulmonary Tuberculosis.—Favez and Aguet (*Schweiz. med. Wchnschr.* 86:843, 1956) have reported a study of 21 patients with recent pulmonary tuberculosis who were treated from the beginning with hydrocortisone and antibiotics. In each patient the radiological findings improved greatly during this treatment. Seven patients received hydrocortisone only after having been given antibiotics for 10 days to three months. In six of these the lesions became worse up till the time when treatment with cortisone was undertaken; then the pathological roentgenographic findings showed marked clearing. In two of eight patients who were treated from the beginning with hydrocortisone and antibiotics, improvement was moderate during the course of hormonal treatment, while in seven others there was no roentgenographic clearing. Four of these received cortisone only after having been treated with antibiotics for one or two months. The administration of cortisone in the patients suffering from progressive pulmonary tuberculosis where foci with a pneumonic aspect predominated brought almost total resorption of the pathological opacities in four to six weeks. After this, further improvement, including the closure of cavities, is brought about gradually with antibiotics.

Thyroid Function in Obstructive Jaundice.—B. R. Scazziga and co-workers (*Schweiz. med. Wchnschr.* 86:875, 1956) studied thyroid function in patients with jaundice. Those with obstructive jaundice showed an elevation of the protein-bound iodine level over and above that which might be expected in patients with parenchymatous jaundice. The authors believe that two different protein-bound iodine compounds are involved. They found the thyroid function to be normal in patients with obstructive jaundice. On the other hand, in patients with parenchymatous jaundice, hypofunction of the thyroid due to pituitary inhibition was observed. The difference between the behavior of thyroid function in obstructive and in parenchymatous jaundice suggests that the glucuronic acid conjugates, products of detoxication of thyroid hormone, would be stripped of all inhibitory action on the pituitary thyrotropic function.

Genetic Effects of Radiation.—An expert committee of the World Health Organization met in Copenhagen, Denmark, to discuss gaps in present knowledge of genetic effects of radiation and to advise WHO how it can most usefully assist in advancing and coordinating research on this subject. Although many investigations have been made on the genetic damage caused by radiation in the fruit fly and the mouse, it is not clear how the information obtained should be interpreted in terms of human heredity. Important information might be obtained by following up the offspring of parents who have received x-ray treatment of the pelvic region for nonmalignant diseases and comparisons might be made between the incidence of inherited sickness among populations in regions where there is a natural high level of background radiation and that occurring in areas of low background radiation.

UNITED KINGDOM

Lipids and Blood Coagulation.—O'Brien (*Lancet* 2:232, 1956) investigated the effect of ingestion of butter, margarine, vegetable fat, and eggs on clotting time, using Russell's viper venom as the clotting agent. The ingestion of 50 gm. of any one of these fats shortens clotting time, determined by the standard Stypven viper venom method, by about 23 seconds. Two eggs, which contain only 10 gm. of fat, produce an even greater shortening of clotting time. The effect in this case was attributed to the presence of phospholipid, particularly phosphatidyl ethanolamine, 0.18 mcg. per milliliter of which is sufficient to shorten the clotting time of blood in vitro. O'Brien has also shown that the active material in platelets influencing blood coagulation is phosphatidyl ethanolamine. It would thus seem that the phospholipid content of a fatty meal is as important as the absolute quantity of fat in influencing clotting time.

The work of O'Brien was confirmed by other observers. Barkhan and co-workers fractionated two phospholipids from human brain tissue (*Lancet* 2:234, 1956). One, an accelerator in blood coagulation systems, is phosphatidyl ethanolamine. The other, an inhibitor, is probably phosphatidyl serine. Maclagan and Billimoria studied the effect of a number of common fatty foods on blood coagulation (*Lancet* 2:235, 1956). The minimum amount of food required to produce the maximum shortening of clotting time when added to 0.2 ml. of normal plasma was determined. Strongly positive results were almost confined to milk products, which in order of potency were butter, cheese, cream, and milk. Further investigations showed that the coagulant activity of these foods was due not to the fatty acids present but to the phospholipid content, probably phosphatidyl ethanolamine galactoside. These investigations, if confirmed, suggest that eggs, milk, and lipid-rich foods should be withdrawn from the diet of patients with a history of thrombosis or atherosclerosis.

Infections in Hospitals.—Two cases of infection in hospitals, one attributed to parsimony in the National Health Service and the other to a shortage of nurses, have been reported. The first case concerned a Plymouth hospital patient whose leg was amputated and who died of infection of the wound by Clostridium organisms. At the inquest the surgeon attributed the infection to contamination of the air of the operating room, in which clostridia had been found two years earlier. Ever since 1948 the surgical staff had been requesting improvements in the operating rooms, but plans had been repeatedly rejected on the grounds of economy within the National Health Service. The other case concerned an infant who died of micrococcic (staphylococcic) toxemia after the insertion of a catheter into the umbilical vein for an exchange tranfusion. All aseptic precautions were taken, and, although a consultant pathologist was not prepared to say whether the infection of the umbilicus was primary or secondary, the coroner attributed death to infection of the operative wound. The area pathologist said that three months earlier 7 of the 11 members of the premature baby unit and 60% of the obstetric ward staff were found to be carriers of pyogenic organisms. Masks and gowns could not eliminate the danger. Highly trained nurses were difficult to obtain and keep, and they could not be replaced just because they were carriers. The pathologists thought that it was better to run the risk of infection than dispense with nurses skilled in the handling of premature and newborn babies.

College of Obstetricians and Gynecologists Libeled.—A libel action was brought by the Royal College of Obstetricians and Gynecologists against a newspaper. The plaintiffs claimed that an article entitled "Must Our Babies Be Born in Pain?" published in the *Daily Sketch* stated that the college had acted shamefully toward a certain obstetrician who had introduced a relaxation technique into obstetrics. This obstetrician aimed at producing a relatively painless childbirth without fear by giving the mother certain exercises during pregnancy and teaching her to relax during delivery. The article stated that the college had caused him to be harried and black-listed by the medical profession. The counsel for the plaintiffs said that this was a grave attack on the honor and propriety of the college and that it was entirely false and without foundation. The defendants apologized, published a note in the *Daily Sketch* expressing their regret at publication of the article, and agreed to pay substantial damages as well as costs of the proceedings.

Use of Fluoroscopes in Shoe Fitting.—Dr. E. D. Dyson, of the United Kingdom Atomic Energy Authority, has investigated the radiation hazards involved in the use of fluoroscopes in shoe fitting (*Brit. M. J.* 2:269, 1956). While it is impossible to calculate the exposure to radiation experienced by any one customer, rough calculations can be made on the basis of the time taken looking through the machine, the number of shoes bought annually, and, in the case of shop assistants, from the number of customers served in a year. The latest machines are fitted with a hand-set timer limiting exposure to 10 seconds. Exposure to radiation is most dangerous in children because they have new shoes frequently and because radiation may check bone growth. Dyson calculates that the dose rates around a typical machine are 4 mr per hour against the viewing hood, 4 to 30 mr per hour for the nearest shop assistant, and about 4 mr for customers near the machine. On the basis that each exposure lasts 10 seconds, that the average customer uses a pedoscope once a year, and that shop assistants sell 30 pairs of shoes a day, the average exposure of the individual can be worked out. Dyson estimates that it is only 1/1,000 of the natural background irradiation dosage. From the point of view of danger to the gonads it is negligible. Nevertheless, he thinks that control measures should be adopted. Machines should all be built to specification with efficient screening; viewing should be done by an assistant whose eyes are adapted to the dark to reduce the intensity of the fluorescence; screening of customer and assistant should be prescribed; and the foot opening should point toward a wall, not into the shop. Assistants should carry monitoring disks as radiographers do, and customers should be warned of radiation hazards.

Erythredema Polyneuropathy.—A severe case of erythredema polyneuropathy in a patient admitted to the Royal Edinburgh Hospital for Sick Children suggested so many features of a hyperactive sympathetic nervous system that the infant's urinary sympathin (epinephrine and levarterenol) excretion was determined by Farquhar and co-workers (*Brit. M. J.* 2:276, 1956). The results were of sufficient interest to justify the investigation of other cases and controls. Among signs of sympathetic hyperactivity in infants with erythredema polyneuropathy are arteriolar spasm in the extremities, hypertension, tachycardia, bowel and bladder relaxation, pupillary dilatation, and sweating. The urinary sympathin excretion in 24 hours in these infants varied from 17 to 74 mcg. (16 mcg. is normal). The response to ganglionic and adrenergic blocking agents is suggestive of a hyperactive sympathetic nervous system in these children. Farquhar states that erythredema polyneuropathy may represent the misdirected zeal of an inexperienced defense mechanism to a number of obnoxious stimuli in certain predisposed infants.

Liability Laws.—Physicians on the staffs of hospitals in England have *agreed to support Scottish physicians in a* campaign to change the law relating to legal liability in the hospital service. The *following resolution* was passed at a meeting of the central consultants and specialists' committee, which represents hospital medical staff throughout England: "It is not in the best *interest of British medicine* and the British people that the hospital doctors of this country should have the legal status of technical employees of the hospital authority." This is what the law at present makes them. This resolution resulted from a request by Dr. A. Smith of Lanarkshire, chairman of the Scottish consultants and specialists' committee, for support from English *physicians of the* Scottish physicians' campaign against the existing law. Before the health service began in 1948, doctor and patient had a definite personal relationship, which *the patient's interests* came first. Under existing
lations the physician's first legal responsi
Recent court judgments have altered
lationship, with the state as a third

now responsible to the patient through the state. This would lead to a situation, according to Dr. Smith, in which a doctor would become a technical expert to carry out the orders of the Minister of Health.

Food Poisoning.—Sir William Savage has called attention to the increased incidence of food poisoning (*Brit. M. J.* 2:317, 1956). After allowances are made for the improved facilities for bacteriological investigation and the increased awareness of the condition by general practitioners, there is clear evidence of a marked increase over the last 10 or 20 years. Savage further states that the evidence points to an extension of salmonellosis in animals. There has been a rise in the number of persons who, either having symptomless cases or being temporary carriers, are excreting Salmonella organisms in their feces. The increase in food poisoning is attributed to various causes. Many people now eat in places where defects in hygiene may result in the poisoning of a large number of customers. There has been an extension of the bulk preparation of packaged foods, which increases the risk of widespread contamination with Salmonella. The increased use of bulked eggs, imported frozen from abroad, for the preparation of confectionery has been responsible for outbreaks of food poisoning by Salmonella of hitherto unknown types. The association of liquid egg foods with food poisoning in Great Britain has been definitely established. Further, the increase in the number of human carriers of Salmonella organisms has supplied more opportunities for food to be infected by those handling it.

The annual number of sporadic cases of infection with Salmonella is large, and Savage urges that official steps be taken to define more precisely the cases to be reported as food poisoning. Prompt reporting and cooperation between the general practitioner and the health officer are essential for the investigation of outbreaks. Savage blames the public health authorities for not keeping up with the revolution in food habits. The preparation of more and more food is passing into the hands of commercial food handlers, whose practices often fall short of essential hygienic standards. The production of foods such as meat pies and prepared meat dishes is now an extensive industry, with many of the smaller concerns failing to observe adequate hygienic standards. The use of machinery for food processing increases the risk of food poisoning because of the difficulty of effective cleaning and sterilization. Dried or frozen egg mixtures are liable not only to bacterial infection in the mixing stages but to distribution of the bacteria through the mass, with extensive multiplication before usage. The author concludes that the dangers resulting from changes in food habits are not adequately guarded even by the latest food control orders.

Dangers of the Trendelenburg Position.—The Trendelenburg position for operations within the pelvis is claimed to be both obsolete and dangerous by Inglis and Brooke (*Brit. M. J.* 2:343, 1956). Originally devised to aid access to the pelvis in gynecologic, urologic, and proctologic operations, the introduction of muscle relaxants and balanced anesthesia has made this possible with the patient in the horizontal position. Far from giving better access to the pelvic cavity, the Trendelenburg position does the reverse, because the more the head is lowered the further does the symphysis pubis obscure the view, with the result that the surgeon must stand with his head at an angle. There are also decided disadvantages from the anesthetist's point of view. Respiration is impaired by the weight of the abdominal contents resting on the diaphragm and vasomotor tone is depressed, with the result that vasomotor collapse is masked, as no fall in blood pressure may be seen. The increased venous return from the lower limbs and abdomen may result in embarrassment of the heart if the action of its right side is impaired, and as the venous return from the head is slowed there is an increased tendency to cerebral thrombosis. In emergency cases there is a real danger of regurgitation of gastric contents, which can, however, be prevented by the use of a cuffed endotracheal tube with free drainage from the pharynx. Respiratory secretions may also gravitate down the endotracheal tube and repeated suction become necessary. In recent years many instances of tracheal plexus palsies after the use of arm boards, shoulder rests, and harnesses used in conjunction with the Trendelenburg position have been reported.

Russian Blood Substitutes.—During a recent visit of a delegation of Russian physicians, Dr. L. G. Bogomolova of the Blood Transfusion Institute, Leningrad, described some of the blood preparations and blood substitutes used in Russia. A process has been worked out for obtaining dried hemoglobin from blood without transformation to methemoglobin. It is used to increase the effectiveness of plasma. A preparation, unknown in the rest of Europe and in the United States, is obtained by repeated autoclaving of serum at 125 C. The albumin disintegrates and forms a transparent brown fluid, which is claimed to stimulate the healing of ulcers when given intramuscularly. Over 1,000 patients with peptic ulcer were treated with the preparation, with a reported improvement in 90% and complete healing in 40%. Another claim made for this sterilized serum is that it dissolves penicillin and that the resulting solution given intramuscularly serves as a long-acting antibiotic preparation. A hormonal preparation obtained from retroplacental blood is used intramuscularly in Russia for the treatment of ovarian insufficiency and climacteric neuroses and dermatoses.

A preparation known as hemostimulin, made from animal blood and such trace elements as copper, cobalt, and molybdenum, is used to treat hypochromic anemia. It is alleged to increase the hemoglobin level by 1 to 1.5% daily. Fibrin films are widely used in surgery. Since they are transparent, the condition of the wound beneath can be observed without repeated dressings or disturbing the area. As it is readily digested by micro-organisms, rapid dissolution of the film can be taken as evidence of infection. Fibrin films impregnated with antibacterial substances are used to prevent the infection of burned surfaces, decubitus ulcers, and skin injuries. Rapidly resolving "bioplastics" made from blood have been used as splints to facilitate gastrointestinal anastomosis. More slowly resolving types are used as intraosseous splints in the treatment of fractures.

As a blood substitute, hypertonic saline solution is preferred to an isotonic solution. Dextrose-saline solutions are often fortified with morphine or with alcohol and barbiturates for the treatment of shock. Ten per cent of stored blood is sometimes added. A preparation obtained by the hydrolysis of blood clot after the extraction of serum and known as aminokrovin is used as a blood substitute in patients with hemorrhage, shock, sepsis, cachexia, hypoproteinemia, and delayed healing. Solutions of the dextran type, known as polyglucin and syncol, are in use as blood substitutes. Russian claims have been made for the preparation of a high molecular weight colloidal carbohydrate suspension, known as AP, without the use of micro-organisms, which are used in the manufacture of dextran. Some progress has been made in the preparation of pectin as a blood substitute. Povidone is also used. A blood substitute made from albumin and comparatively free from anaphylactogenic properties is used under the name of VK-8. This is given in amounts of from 2 to 4 liters in patients with blood loss, shock, and hypoproteinemia. Solution L-103 is an incomplete hydrolysate of animal blood, prepared by the use of ion-exchange resins. Another protein hydrolysate, aminol, has been produced at the Leningrad institute by the enzymic hydrolysis of animal blood. Several combined solutions have been suggested, such as L-103 with 1% human plasma to increase the colloidal properties. UBP is a combination of the dextran syncol with a protein hydrolysate.

Physicians' Incomes.—In reply to a question asked in the House of Commons, Mr. Turton, the Minister of Health, quoted the average gross earnings of general practitioners in Great Britain working under the National Health Service. In 1952 they were $6,270; in 1954 they were $9,013; and in 1955 they were $8,740.

Secrecy in the National Health Service.—Service Committee and Tribunal Regulations provide that when complaints against physicians are heard the committee shall sit in private, unless the respondent physician requests otherwise. The desirability of such privacy has been questioned by the committee on administrative tribunals, sitting under the chairmanship of Sir Oliver Franks. The British Medical Association representatives said that the doctor-patient relationship was based on confidence in the physician and that it would be harmful to that confidence if the complaint received press publicity and was eventually not substantiated. Asked if the "poor patient can get his complaint fairly and impartially judged," Dr. E. A. Gregg, for the B.M.A., said that he was amazed at such a question. All patients have the right to claim for damages in the courts if they are aggrieved, and they may get free legal aid if necessary. The chairman of the National Health Service tribunal said that he saw no reason why the proceedings should not be public. The suggestion that unreasonable or frivolous complaints might damage a physician's reputation was not a sufficient reason for secrecy. Since 1948, 73 cases have been investigated and in no case did the respondent physician ask that the inquiry be made public. Secrecy in the meetings of regional hospital boards, hospital management committees, and local medical executive councils, all of which operate with the National Health Service, may be no longer possible if a bill before Parliament becomes law. This would give the press and the public the right of admission to meetings of various public bodies, including those mentioned. The bill would also apply to committees or subcommittees appointed by these bodies, including those investigating complaints against physicians, but according to the bill each public body would have the power to exclude the press temporarily. The press would have the right to obtain copies of the proceedings later.

Duodenal Ulcer.—Brown and Wood have described a treatment for chronic duodenal ulcer based on the surgical removal of the ulcer, with conservative gastroduodenal resection (antroduodenectomy) followed by irradiation of the remaining portion of the stomach to reduce the secretion of acid and pepsin, thus reducing the risk of recurrence (*Lancet* 2:169, 1956). This procedure was adopted because the results of treatment of duodenal ulcer by subtotal gastrectomy with gastrojejunostomy were far from satisfactory, with many patients suffering from recurrent dyspepsia, biliary regurgitation, and loss of weight and strength. The antroduodenectomy is a conservative Billroth 1 operation that allows a liberal portion of stomach to remain and maintains the natural channel for food through the duodenum. Removal of the antrum also lessens the tendency to recurrence. Fine absorbable surgical suture (catgut) is used for the mucosal layer because interrupted nonabsorbable (silk thread) sutures were found by gastroscopy to remain in situ for a year or more, and it was believed that they might have predisposed to recurrence. The irradiation, which consists of a total gastric tissue dose of 2,000 r, is given two months after the operation over a period of three weeks. Antacids are given between the operation and the end of the irradiation to control gastric secretion. Over a four-year period 142 patients with duodenal ulcer have been selected for treatment, which was based on the usual criteria for surgical intervention in duodenal ulcer. Fifty-two were subjected to antroduodenectomy followed by irradiation, and a control series of 48 had antroduodenectomy without irradiation. A prolonged follow-up showed, however, that irradiation has no significant effect in reducing the recurrence rate, which was 12%. Brown and Wood think that the recurrence rate is too high, but they feel encouraged to continue with a modification of the operation because the results in 83% were excellent.

Addiction to Barbiturates.—The Society for the Study of Addiction held a symposium in July on the abuse of barbiturates. Dr. R. A. Hunter (London Hospital) said that barbiturates are drugs of addiction and that they are used more than any others by addicts in Britain. This is because they are too freely prescribed, the reasons for this being that certain patients clamor for them and that in mild psychiatric or psychosomatic disorders they are being used as a short cut to psychotherapy. Simple psychotherapy, which is all that many patients require, takes too long or requires training not possessed by the average practitioner. Barbiturates have now come to be regarded as a placebo for those who are not seriously ill, either mentally or physically. Most barbiturate addicts can be divided into those with benign addiction, whose habituation is mild and interferes little with social function, and those with malignant addiction, who suffer from severe loss of social function. The too-lavish prescription of barbiturates has produced many persons with benign addiction in whom barbiturate abstinence combined with symptoms of intoxication may transform a mild psychiatric disturbance into a more serious one. These patients are true addicts, although the condition might not be recognized until the drug is withheld or the dose increased, to obtain the desired effect, until barbiturate intoxication occurs. Persons with malignant addiction are often patients with severe mental illness who have been sidetracked into drug addiction by barbiturates. Barbiturate addiction is as dangerous as that due to morphine. The speaker deprecated the use of a stimulant such as amphetamine with a barbiturate, because one masks the effects of the other and the patient becomes intoxicated by both. Referring to the use of tranquilizing drugs in mental hospitals, he said that many drugs had been introduced to treat patients but had finished up as drugs to keep the patient quiet.

Dr. Sidney Locket (Oldchurch Hospital, Romford) said that the abuse of barbiturates is deplorable, because they are still the standby in the treatment of epilepsy. He found it hard to believe that the vast quantities used, an average of one tablet daily throughout the year by 4% of the population of Great Britain, are essential for the treatment of disease. In his hospital alone he saw hundreds of patients with barbiturate poisoning every year, many of them suicides or attempted suicides. The total number of patients with barbiturate poisoning treated in British hospitals is about 7,000 a year. They account for 1.21 per 1,000 general hospital admissions in the course of a year, varying from 1.65 in Scotland to 0.69 in Wales. There were no recorded admissions for barbiturate poisoning in Eire. Barbiturates are essential for the treatment of many diseases, and the public should be educated to their limitations and dangers. In 80% of the patients with intoxication admitted to Oldchurch Hospital, the sole or major reason for prescribing barbiturates was insomnia. Many patients had a stock of these drugs at home. Suicides from taking barbiturates have increased sharply, the most recent annual figure being 13 per million. This figure is probably higher because accidental death from barbiturates rather than suicide is frequently returned as a coroner's verdict. Barbiturate misuse falls into four groups: prolonged misuse in moderate overdosage; the use by addicts, often with alcohol; the taking of large doses to induce sleep; and suicide from barbiturates. The speaker did not believe that a combination of barbiturates and alcohol had a greater effect than the sum of the actions of the two components.

Dr. Harold Davis, the chief pharmacist to the Ministry of Health, said that of 100,000 national health service prescriptions in 1955, nearly 10% were for barbiturates or for medicaments containing them. The annual cost of barbiturates under the National Health Service is nearly $4,500,000. This does not include the cost of barbiturates bought outside the service. It was difficult to predict the cost of the new tranquilizers, but they would probably cost more. Dr. F. E. Camps, a pathologist, said that he was certain that many cases of fatal barbiturate poisoning remain undiagnosed because the average general practitioner does not suspect it. He had investigated the blood and urine in several cases of sudden death that would otherwise have been attributed to such conditions as coronary disease and found high concentrations of barbiturate. It is possible that barbiturates cause many undiagnosed deaths in babies.

Cancer of the Lung and Stomach.—Dr. Alan McKenzie has investigated the degree of accuracy in the diagnosis of cancer of the lung and stomach (*Brit. M. J.* 2:204, 1956) to determine whether these conditions are being overreported. To assemble the necessary data a questionnaire was sent from the general register office to every medical practitioner in respect of every second death ascribed to cancer of the lung or bronchus in January, 1955. If a diagnosis was made after bronchoscopy, detection of tumor cells in sputum or exudate, operation, or autopsy, it was classed as "established." If diagnosis was based on radiological examination or a specialist's consultation it was classed as "corroborated." All diagnoses made on clinical grounds only were described as "unsupported." In the case of carcinoma of the lung 3.2% of diagnoses were unsupported, 63.9% were corroborated, 56.2% were established, and in 2.8% the diagnosis was altered. The corresponding figures for cancer of the stomach were 8.4, 30.4, 59.5, and 1.7 for men and 18, 39.5, 38, and 4.5 for women. According to these figures, cancers of the lung and bronchus are not being overreported on death certificates, but it is still not possible to say whether the disease is being underreported, as most probably happened in the past. Not infrequently the diagnosis of bronchial cancer is not made until after a postmortem examination, and it is probable that the true numbers are still greater than appear from the death registrations.

The only conclusion drawn on the inquiry on stomach cancer is that certification of death from this cause is less likely to be accurate among older than among younger persons and that in a large proportion of those who die over 75 years of age the diagnosis cannot be regarded with complete confidence.

CORRESPONDENCE

ATHLETICS IN SCHOOL

To the Editor:—I appreciate the fact that Dr. S. E. Bilik, for whose work I have profound respect and admiration, has taken the time to comment at length in a recent issue of The Journal (161:1502 [Aug. 11] 1956) on my article, "A Physician Looks at Athletics" (*J. A. M. A.* 161:573 [June 16] 1956). I am in full accord with the basic principles that Dr. Bilik elucidated in his letter, but I am constrained to point out that he has misinterpreted my article to make it appear that my own opinions are contrary to these principles. I do not imply that there is "some sort of a tug of war between coaches . . . and physicians"; on the contrary, I am one of the many team physicians who enjoy an excellent and mutually profitable relationship with coaches. My position is that adequate health protection of athletic youngsters requires the "joint efforts of physicians, coaches, trainers" working as a team. I share Dr. Bilik's respect for Mr. Schneider, the coach of the high school team for which I am responsible medically. Charlie and I must get along well—he hired me, after he had known me for years and after I had been a player on one of his own high school teams.

Second, nowhere in my article did I state or infer that coaches and trainers misuse their youngsters in order to advance the interests of the school. Of course no coach or trainer does that! I did, however, wish to direct attention to the fact that coaches and trainers—through ignorance, not ill will—often make decisions that adversely and sometimes permanently affect their players' health; that "well-meaning trainers, coaches, and officials cause more disability than they prevent." I plead against ignorance and its inevitable concomitant, indifference. I agree with Dr. Bilik's description of trainers, insofar as the description applies to trainers in colleges and universities. The same broad generalizations cannot, unfortunately, be made about trainers in the secondary schools. I have always enjoyed excellent working relationships with trainers, a fact that is, perhaps, indicated by my recent election to advisory membership in the National Athletic Trainers Association. Continually in other papers and in talks to both physicians and nonmedical personnel interested in the health of athletes, I have emphasized the importance of joint responsibility. I have many times pointed out that, in some areas of overlapping interest, trainers and coaches often exhibit *a greater depth and precision of knowledge than do physicians* about health and safety measures for the members of their teams.

I am astonished by Dr. Bilik's apparent attitude that team health and safety are not proper and immediate concerns of the physician. Surely Dr. Bilik does not mean to suggest that physicians abrogate their responsibility to supervise and control, if not actually execute, any measures that directly influence health and safety. Trainers and coaches have their part to play, but—and this is the important consideration—the responsibility is joint, not exclusive. Certainly I do not suggest that team physicians buy athletic equipment, but I do suggest that team physicians be familiar with equipment, again so that they are able to execute their advisory responsibilities properly. My feeling is that a physician has every right to "meddle" in those areas concerning health and safety where his special knowledge implies special competence. No, a doctor need not treat every minor injury, but the decision as to whether an injury is minor is, usually, best left to the doctor. Of course first aid will be administered by coaches and trainers, but I urge these coaches and trainers to err on the side of caution and call a physician if there is any doubt at all about the nature or extent of the injury. The dangers of first aid given by laymen to seemingly slightly injured persons have already been well documented in the literature. Dr. Bilik has played a significant, indeed a pioneer, role in the treatment of athletic injuries and in sports medicine generally. However, after 30 years of involvement with nearly every phase of athletics, as player, coach, official, administrator, and team physician, I am not without adequate pegs of practical experience on which to hang my theoretical observations. There are so few physicians who have deep interest and broad knowledge about athletic injuries that I must close this communication with a plea for more, not less, communication between these few physicians.

ANDROGEN THERAPY

To the Editor:—In the last 20 years the introduction of potent testosterone compounds has for the first time made it possible to induce androgenic effects in patients suffering from male hypogonadism. Soon after the successful synthesis of testosterone, it was found that certain esters, notably the propionate, produce greater androgenic activity, and testosterone propionate became the most popular agent for androgen substitution therapy. This compound is a potent androgen but is not ideal for human therapeutic use because it is only effective when given by frequent intramuscular injections, e.g., 25 mg. three times a week. Methyltestosterone is more convenient because it is effective when swallowed, but only in doses four or more times as large as those of testosterone propionate, rendering it an expensive form of therapy. At the endocrine clinic, University of California School of Medicine, sublingually administered methyltestosterone has been practically as effective as injected testosterone propionate, milligram for milligram (Escamilla and Gordon: Efficacy of Testosterone Compounds Administered Sublingually to Hypogonadal Men, *J. Clin. Endocrinol.* 10:248, 1950). It has the advantages of economy and ease of control; its disadvantage is that tablets must be dissolved slowly in the sublingual or buccal positions, which usually requires 30 to 60 minutes or more.

In the last five years androgen therapy has been simplified somewhat by the use of long-chain testosterone esters, which, when given intramuscularly, exert their effects for approximately one month. These compounds, the cyclopentylpropionate, enanthate, phenylacetate, and hexahydrobenzoate, have replaced the even longer acting pellets because they do not require surgical implantation, have a more even action, and are free of the danger of overdosage from fragmentation of the pellet. They have the disadvantage that their action cannot be terminated when undesired effects appear, e.g., hypercalcemia in osteolytic metastases from carcinoma of the breast.

Recently Herr and co-workers (Herr and others: Synthesis of Potent Oral Anabolic-Androgenic Steroids, Communications to the Editor, *J. Am. Chem. Soc.* 78:500, 1956) described the synthesis of 9α-fluoro-11β-hydroxy-17α-methyltestosterone, known as fluoxymesterone (Halotestin). Lyster and co-workers (Lyster and others: *Endocrinology,* to be published) described the androgenic activity of this compound in the rat. We have administered this compound as tablets for oral use to 10 hypogonadal men, 4 of them with primary testicular hypogonadism and the other 6 having hypogonadism secondary to lack of pituitary gonadotropin. Eight of the 10 had previously been treated with other androgens; in 2 administration of fluoxymesterone was the initial treatment. The maintenance dose, using the criteria of Escamilla and Gordan, in these patients was 10 to 30 mg. of methyltestosterone per day as tablets for buccal administration in seven patients or intramuscularly given testosteronecylopentylpropionate, 150 to 200 mg. per month, in five patients. In all 10 cases full androgenic effects were achieved and maintained by the oral administration of 1.5 to 2 mg. of fluoxymesterone per day over a period of four to six months. Because of the presence of an 11-hydroxyl group in the molecule, the possibility of corticoid activity was considered; no edema or hypertension occurred.

BRASS PIPING

To the Editor:—With respect to the article in Business Practice, The Journal, Feb. 18, page 590, I would like to call attention to the fact that brass piping is not a good insurance against piping troubles. In some cases, even copper piping fails where the water is particularly aggressive, but brass pipe of a type once much used has almost gone out of use because there have been so many failures.

MISCELLANY

THE MEDICAL SOCIETY BULLETIN

Edward R. Pinckney, M.D., Napa, Calif.

Most large medical societies already publish their own periodicals. What about the small society? It, too, should have a regular means of communication. The basic purpose of having a monthly bulletin put out by the medical society consists primarily of getting local medical news of interest to its physician members. It is just another means of the "grass roots" approach to the dissemination of information of special importance to members of the particular society. Any physician who has attended small society meetings has been witness to situations where there was either (1) a guest lecturer and no business meeting, so that the physician remained completely oblivious to the medicopolitical matters that concern him; or (2) an excessively prolonged business meeting where a particularly interesting point of discussion obliterated the necessary planned program.

Between meetings, an active medical society office floods its members' mailboxes with notices of future meetings, lists of applicants to be voted on, and comments on a random sample of medical business matters, all of which are of great importance but easily overlooked because they arrive amongst the piles of third-class mail. Besides this onslaught of what might honestly be termed necessary information to the private practitioner, there are many other matters that should be brought to the doctor's attention in such a way that he will not only find the literature easy to read but be able to utilize the information. Some examples would include announcements concerning (1) local, state, and federal legislation (both before and after voting takes place, with comments on how the result of same will affect his practice); (2) postgraduate courses; (3) future meetings; and (4) general state medical policies.

What else can a medical society bulletin do for its members? Not only can it announce the future society meetings but, of even greater importance, it can present the conclusions of the executive committee as well as the results of the meetings of all the other specialized committees, so that the doctor has a bit of time to consider recommendations before he is asked to vote on them. Local hospital news, results of epidemiological investigations pertinent to the area, and even a gossip column telling, for example, where some of the doctors and their families are having their summer vacations are just a few more items that might be of particular interest to society members. This is another means of solidifying the professional and family outlook toward the practice of medicine.

Another equally important service of the bulletin is to provide a summary of the past society meeting. Often enough, a well-intentioned physician is unable to attend the regular meeting of the society for various reasons. Without an official society publication, the absent doctor usually hears of his society's decisions in a vague secondhand way, if at all. Yet these matters can be of great importance to him in his future practice and his relations with his fellow members. Actually, it is easy to sum up all this material, plus much more strictly local information, in about a dozen 6-by-9-in. carefully edited pages. Intersperse these pages with a few local and national advertisements, some necessary and periodic statistics, and a few opinionated expressions, and you have a monthly medical society bulletin.

In essence, then, the bulletin provides a small, up-to-the-minute guide to local business aspects of medicine. Unless your society happens to have an unusually prolific scientific writer, the bulletin should make no attempt to compete with all the other medical publications primarily concerned with medical research and clinical results. This, however, is not meant to deter a local physician from presenting an unusual clinical case or bringing to light some new idea he has been working on.

Distribution of this bulletin, not only to the members of the society and the auxiliary but also to members of the allied professions (e. g., pharmacists, detail men, community leaders, voluntary health workers, and advertisers) tends to promote much better public relations. The public is made to realize that the medical society is not a "secret" society and that its findings and discussions are of such a nature that the medical profession is not ashamed to have them known. With only this bit of background, it seems pretty hard to refute the idea that even the smallest society should have some form of monthly publication to incorporate all the above information.

How does one go about obtaining all the assets previously listed? In other words, how do you get a bulletin going, how much does it cost, who pays for it, and where do you get the people to find the time to do such a thing? Before such a venture is begun, the majority of the society members must really want such an organ of communication and be willing to underwrite the cost of the first few issues, if necessary. When one weighs the cost of publishing a bulletin of this type, one must reasonably deduct the cost of secretarial help, office facilities, and supplies, stationery, and postage that are already being used in dispensing information. But before actually going into cost, which seems to end up as the all-important factor, let us go back to developing the idea.

Once the society agrees that this is a venture worth attempting, a definite trial period should be established, say, six months. Next, a publication committee should be appointed and empowered to handle all necessary transactions in the name of the society. The committee elects its chairman, who is usually designated as the editor of the bulletin. No article could tell you which man to pick for this position, but surely every society has a few members who are interested in this sort of work. Aside from one or two organizational meetings, it should not be necessary for the members of the committee to devote more than two hours a month to this publication, and the editor can do a very substantial job if he plans to give one and one-half hours a week to it.

In more detail, the editor's work will consist of gathering together the pertinent information; proofing, cutting, and adding where necessary; and reviewing the entire concept with the committee. The hardest task the editor may have to face during the formative period is that of getting the material forwarded to his desk. This actually amounts to his sharing his burden among members of the society. Once procedures are set, the chairmen of the different society committees send the editor brief reports of their meetings, when held. It should take a particular physician's secretary no more than 15 minutes to write this up and send it to the editor. The society's selected secretary follows the same procedure with the executive committee minutes, which he is obligated to write up anyway. He also can include information on the next meeting, information on and pictures of new applicants, and an outline of the society's financial state. Reports on legislative and other political actions that affect medicine are readily furnished by the state association. The health officer will furnish vital statistics as well as pertinent information about public health affecting the private practitioner. Editorials may provide an opportunity for members to express their opinions. All of the material is typewritten, with double-spacing and wide margins, and sent to the editor. The number of words to a page depends on the type size used and on page size. The editor should usually stipulate the number of words needed for each particular article he requests. After one or two issues, the editor will find he is overstocked with items of interest, pictures of the new hospital, exhibits, and displays. The amount of material published is limited only by the allocated cost of production.

As regards cost, the easiest solution is to leave it to someone else. While this may sound facetious, it is meant to be quite serious. The simplest way is to hire an advertising counsel on a percentage basis. The net income to the society from advertising may be used to lessen or even to entirely defray the cost of

---

Former editor, *Bulletin of the Napa County Medical Society.*

publication. Hiring a nonmedical advertising counsel provides many other benefits, one of which is that the physician does not have to solicit business. A good advertising counsel can handle the entire business affairs of the bulletin, from layout to collection of accounts. He can be the one to make contracts and deal with the printer directly. While strictly guided by the policies of the publications committee of the society, he nevertheless eliminates the need for what might be considered unethical activity on the part of a physician. His business is simply business, and the society is limited to purely medical participation.

While cost varies in all parts of the country, $100 a month, before advertising is even considered, would probably sustain a 16-page bulletin. And, if just 5 or 6 of those 16 pages were used for advertising, the bulletin could be self-supporting. The typing of address stickers, the application of the stickers to the bulletin, and sorting and delivery to the post office can be made a very worthwhile service of the women's auxiliary.

In our busy present-day medical practice, the political and commercial side of medicine is equally as important as the clinical side. Here is just one more way of getting information to all members of a society, whether large or small, by a means economically within the society's means.

P. O. Box 599.

THE LEISURE CORNER

SCALE-MODEL RAILROADING

Scale-model railroading, a hobby that many doctors have found particularly suited for their leisure time, combines creativity and "operating" pleasure in equal measure. The fact that most model railroaders are adults contradicts the prevalent belief of a portion of the public that "playing with trains" is only for children. There is a vast difference between the familiar toy train set and a scale-model railroad layout. The truth is that building and operating a model railroad empire requires more skill and patience than most youngsters possess, although a sizable number of teen-agers are model rail enthusiasts. Few women, by the way, are independent model rail fans, but many become absorbed in the hobby once their husbands adopt it.

The objective of the serious model railroader is the creation of a completely authentic railroad empire. This involves such activities as the actual construction of locomotives and freight or passenger cars, the designing and wiring of track, the building and painting of scenery, and the construction of such miniature buildings as stations, factories, stores, and residences. In pursuit of reality, some model railroaders have re-created famous railroad problem areas and have actually solved the trouble through ingenious track plans. Others concentrate on scenery and build to scale a duplicate of a section of their own home town.

The advanced model railroader makes use of such skills as an electrician, a carpenter, a traffic engineer, and an artist have. The beginner, however, must master only a few simple tools: screw driver, small hammer, long-nose pliers, model knife, and small file. Basic carpentry is helpful in constructing the supporting frame for track; soldering, painting with an airbrush, drilling, and tapping are skills that come in handy later on. Although most hobbyists in this field limit themselves to relatively small layouts—perhaps covering an area of 5 by 10 ft.—some veterans build layouts as large as 30 by 30 ft. that take years to complete.

The novice hobbyist will find plenty of help available. Owners and employees of hobby shops will assist the beginner in getting started. Many cities have model railroad clubs, which welcome newcomers. There is a nationwide organization for rail fans: the National Model Railroad Association, with headquarters in Canton, Ohio. Perhaps most valuable are a number of basic books and periodicals: "Practical Guide to Model Railroading," "How to Wire Your Model Railroad," "Track and Layout," and *Model Railroader* and *Model Trains*. All of these are published in Milwaukee, a city that boasts the oldest model railroad club in the country and the birthplace of the national association.

When a basic layout has been created, the model railroader enters into the second phase of his hobby: the operation of the trains. (Actually, a layout is never "finished"; the possibilities for expansion are limited only by the amount of space available.) Variations in operation are endless. Many enthusiasts with large layouts even follow the timetables of existing railroad lines, while, in model railroad clubs, extensive operations may take place with members serving as engineers, towermen, yardmasters, switchmen, and even dispatchers.

With the growing popularity of the HO gauge model train, complex layouts can be set up in relatively small areas. The most popular spot for the pursuit of the hobby is a basement, but attics, spare rooms, and garages are often used. Some hobbyists even manage to find space in house trailers. The gauge of the track is determined by the inside distance between the rails. O gauge is the familiar "toy train" size and is one forty-eighth the size of the actual train; HO gauge is half the size of O gauge; S gauge is midway in size between O and HO; and TT, or table-top, gauge is less than one-half the size of O gauge, or one one-hundred-twentieth the size of the actual train. Cost makes little difference in choosing which gauge you wish to use. It will depend on available space and the amount of detail desired.

Compared with the serious pursuit of such hobbies as photography, model railroading is inexpensive. The initial investment need not be great: power-pack (which operates the locomotive) averages about $12; locomotive kits are available at $4 and up; freight car kits are between $2 and $4; track and scenery can be bought for a few cents per unit. Assembled, ready-to-run scale-model equipment costs slightly more. After the first major expenditures, the average hobbyist, according to *Model Railroader*, spends about $2.85 a week on his hobby. The biggest investment in any layout is in time and creative thought.

Specialization in model railroading keeps long-time enthusiasts interested. A West Coast physician builds nothing but models of cars on the Sacramento Northern interurban line. A Brookfield, Mass., man, a signal maintainer of the Boston and Maine Railroad, likes signaling so well that he built an elaborate signal system for his back-porch model layout. Others find their greatest pleasure in building bridges, cabooses, or stations. Those with a bent for history like to duplicate ancient trains and track layouts. Some fans, with time and money, will visit and duplicate existing trains and lines that are, in some way, unique, such as the Mojave Northern line, which runs only 15 miles over the Mojave desert to link a quarry with a cement plant.

Just why scale-model railroading should exert such fascination over so many American males is a matter of individual opinion, but the manufacturers, hobby shop proprietors, and publishers who serve the field generally agree that it is related to the well-established appeal of real railroading—the whistle in the night, the power of huge locomotives, the lure of distant places. Physicians who are model rail enthusiasts have found it eminently satisfactory for filling their leisure hours. Since they find time for travel difficult to obtain, the vicarious pleasure they achieve through operation of a layout is easily understandable. The relaxation found in doing something mechanical and, at the same time, artistic appeals to many doctors. Then, too, model railroading is ideal for a person who may be called away suddenly—a few minutes of work with the layout can be as refreshing as several hours. One pediatrician has even put his layout to work in establishing rapport with his patients; he invites youngsters to his home occasionally to watch while he and members of a model railroad club operate the trains. Whatever the reasons for the growing appeal of this hobby, the fact remains that there are more model locomotives plying tracks in basements and spare rooms than there are actual locomotives on real railroads.

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

The Blood Picture in Rubella: Its Place in Diagnosis. F. K. M. Hillenbrand. Lancet 2:66-68 (July 14) 1956 [London, England].

The author investigated the blood picture of patients with rubella in the Falkland Islands as well as in Britain. He found that in conjunction with lymph-node enlargement the results of routine white blood cell counts are sufficiently characteristic in rubella to permit a confident diagnosis even of subclinical infection with german measles, in which symptoms may pass unnoticed. This aid to early diagnosis can be very important when it is necessary to protect by immunization a pregnant woman who has been exposed to the infection. The lymphatic hyperplasia, mainly of the postauricular and occipital lymph nodes, which typically follows rubella and may persist for many months, is associated with the presence of Türk cells and plasma cells in the blood. When persistent lymph-node enlargement is associated with these blood changes, a retrospective diagnosis of rubella can be made. The fact that patients with rubella (clinical or subclinical) examined between the first and ninth days showed plasma cells or Türk cells, which nearly always persisted until the sixth week, means that a person not showing these changes is very unlikely to have had rubella. In their absence, therefore, there is no need to fear damage to the offspring of a pregnant woman or to consider the advisability of therapeutic abortion.

An Epidemic Caused by APC Virus. R. Glander, G. A. v. Harnack and H. Lippelt. Deutsche med. Wchnschr. 81:1147-1149 (July 20) 1956 (In German) [Stuttgart, Germany].

The occurrence of an epidemic of respiratory disease in Hamburg, Germany, in the course of the last six months of 1955 is described. In the beginning, only children predominantly of school age were affected, but later adults also became ill. Thirty-two girls and 23 boys between the ages of 1½ and 14 years were admitted to the pediatric department of the General Hospital of Hamburg-Heidelberg or to the pediatric clinic of the University of Hamburg. The children had fever mostly above 103 F (39.5 C), which was remittent or intermittent and continued for from two to eight days. Upper respiratory symptoms were limited to the nose and pharynx. The tongue had a white or brownish coating, but the edges and the tip of the tongue were dark red. Cervical lymph nodes were enlarged. Eighteen children complained of lower abdominal pain, 7 had diarrhea, and 21 vomiting and nausea. Nuchal rigidity was observed in three children, but lumbar puncture did not reveal any abnormality. Forty-seven children had characteristic eye symptoms; 14 had unilateral conjunctivitis and 33 had bilateral conjunctivitis. Twenty-five children had leukopenia, and 14 of these had 70% granulocytes with segmentation nuclei. A deviation to the left in the granulocytes with a maximum of 34% cells with rod-shaped nuclei and immature cells was observed in 26 children. Eosinophils were absent in 50% of the patients. Toxic granulation of the cells with segmentation nuclei was observed occasionally. The hematological picture thus was similar to that in measles. The erythrocyte sedimentation rate varied from 10 to 30 mm. in 32 children. The clinical aspect suggested that the disease was caused by adenoid-pharyngeal-conjunctival (APC) viruses, but for technical reasons attempts at isolation could not be made. Complement fixation tests carried out by the virus department of the Children's Hospital of Philadelphia revealed that the epidemic respiratory disease was caused by APC virus of type 3; all tested serums contained neutralizing antibodies against this virus type. Antibiotics did not influence the course of the fever. Temperature was restored to normal by symptomatic treatment in most of the patients, but occasionally convalescence dragged on for several weeks.

Report on an Epidemic Caused by APC Virus. E. Breckoff. Deutsche med. Wchnschr. 81:1149-1151 (July 20) 1956 (In German) [Stuttgart, Germany].

Breckoff reports on 241 children with acute respiratory disease who were treated by him at their homes in villages on the outskirts of Hamburg during the epidemic outbreak described in the preceding paper. Most of the patients were between the ages of 5 and 16 years and only 22 (9%) were less than 2 years old. The epidemic began during the summer vacations, and the number of cases increased considerably with reopening of the schools, so that of the 1,500 children of school age 300 to 400 were absent from school at the same time. In some families several siblings became ill, and the incubation period varied between four and five days. The symptoms and signs described in the previous paper were also observed in these patients. The pharyngeal mucosa was very red, there were petechiae at the soft palate, and the posterior pharyngeal wall showed a fibrinous coating of dirty-grey color. Nose breathing was considerably hampered or even obstructed. The nasal mucosa was swollen, the conchae thickened, and the vessels distended. Many children complained of earache, and changes in the tympanum consisted of injected and tortuous vessels similar to those seen in the conjunctivas. A dark-red ring surrounded the tympanum. None of the children coughed. Bronchitis, pleuritis, and bronchopneumonia were absent. There were no deaths. All children recovered completely on symptomatic treatment. There was a definite tendency to relapses, which occurred within two or three weeks, but in an attenuated form. It took many weeks and even months until the work capacity of the children was completely restored.

Outbreak of Unusual Form of Pneumonia at Camp Gruber, Oklahoma, in 1944: Follow-Up Studies Implicating Histoplasma Capsulatum as the Etiologic Agent. A. E. Feller, M. L. Furcolow, H. W. Larsh and others. Am. J. Med. 21:184-192 (Aug.) 1956 [New York].

An outbreak of an unusual form of pneumonia occurred at Camp Gruber, Okla., in the spring of 1944. Twenty-seven men were admitted to the Station Hospital at the camp, all of whom had entered an abandoned storm cellar during field maneuvers, about 12 days before the onset of the disease. The closed chamber and the hot air currents in the storm cellar created ideal conditions for the air-borne dissemination of spores that might have been inhaled by the occupants. The illness was characterized by the sudden onset of predominantly constitutional symptoms, substernal pain, and constriction in the chest. Most of the patients were severely ill for from two to four weeks. The scarcity and minimal nature of physical signs over the lungs were impressive in contrast to the widespread roentgenographic changes. A disseminated type of pneumonitis occurred during the acute illness that subsequently tended to become nodular in character and faded slowly during the period of observation. Later examination showed that calcification, which in most patients was of a miliary type involving all lobes, had developed in the lungs. Etiological studies made during the outbreak and for several months thereafter failed to reveal the cause.

A comprehensive follow-up study was carried out on 26 of the 27 men who were hospitalized in the spring of 1944. In addition 11 other soldiers were studied, 3 of whom were men in whom roentgenograms of the chest had revealed characteristic widespread pulmonary infiltration but whose illnesses had occurred at Camp Gruber in 1943, one year before the outbreak of the

The place of publication of the periodicals appears in brackets preceding each abstract.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individuals in continental United States or Canada who subscribe to its scientific periodicals. Requests for periodicals should be addressed "Library, American Medical Association." Periodical files cover 1947 to date only, and no photoduplication services are available. No charge is made to members, but the fee for others is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time, and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

use of a tourniquet was the best method of preventing fat embolism. As a result of a method of detecting fat droplets in the circulating blood, it has been possible to make a study of fat embolism in 100 patients undergoing elective orthopedic surgery. The results of this study have been correlated with those obtained in experiments on animals. By these investigations it has been demonstrated that (1) fat embolism is more frequently associated with operations on bone than with operations on the soft tissues; (2) the use of a tourniquet in an operation on bone effectively sequesters fat in the extremity and prevents fat droplets from reaching the systemic circulation; and (3) compression of the soft tissues by a tourniquet produces a minor degree of fat embolism. A tourniquet should be used whenever possible in operative procedures involving trauma to bone because of its value in minimizing fat embolism. It is surprising that the knowledge of the prophylactic value of a tourniquet in bone operations has not been widely disseminated.

The Use of Chloramphenicol Succinate in Surgery. G. Gugliano and G. Bianchi. Minerva chir. 11:502-508 (June 15) 1956 (In Italian) [Turin, Italy].

The parenteral administration of chloramphenicol is now possible because of the recent discovery by Italian chemists of a chloramphenicol succinate: a white, crystalline, and readily soluble powder. Its chemical formula is D-threo-1-p-nitrophenyl-2-dichloroacetamido-3-succinaxy-1-propanol. The authors studied the effects of this antibiotic in patients undergoing surgical treatment. The effects of the drug were evaluated from two points of view: clinical, by considering the time needed for complete termination of fever; and bacteriological, by considering the time required for the pathological effusions to become sterile. In a period of two years the drug was given to more than 500 patients with inflammatory lesions of bones or joints, compound fractures, and peritonitis due to acute appendicitis or to other causes. The injections were given very slowly, were repeated daily, and were continued until the disappearance of the infection. Inflammatory lesions were completely sterile after 48 hours. There were no cases of intolerance or intoxication. Injection of the drug into the peritoneal cavity was not followed by local or general reaction. The drug had a greater effect on severe inflammatory lesions when it was injected locally or directly into the artery. In a few rare cases the germs resisted the effects of the drug.

Homogeneous Statistics of 38 Cases of Chronic Relapsing Pancreatitis Operated on in 1952 and 1953. P. Mallet-Guy, J. Feroldi and R. Vidil. Lyon chir. 51:531-556 (July) 1956 (In French) [Paris, France].

The results obtained by the authors in chronic relapsing pancreatitis do not support the pessimistic views held by some of those who are concerned with this problem. Progress should be made not by discarding the accomplishments of the past but by using them as a basis for future achievement. The effectiveness of several of the surgical procedures now in use is clearly shown by the statistics on 38 patients with this condition who were operated on during 1952 and 1953. Only cases in which the diagnosis was established by a typical clinical course, the discovery of indisputably inflammatory lesions, and a confirmatory biopsy were included. The operation to be performed should be chosen on the basis of a methodical survey of each patient, including biopsy of the pancreas and manometric and radiological studies of the biliary passages. A left pancreatectomy, which was used successfully in one case, is indicated when the lesions are strictly localized on the left side of the pancreas. A left splanchnicectomy, which should be used in cases in which the conditions for pancreatectomy are not met and there is no demonstrable dystonia of the sphincter of Oddi, was carried out in 23 cases, either alone (15) or in combination with external biliary drainage (2) or biliary anastomosis (6). Biliary anastomosis is not a treatment for pancreatitis. Manometric and radiological evidence of choledochal compression suggested its use in eight cases, but in two the rapidly fatal course of the disease prevented its execution. Dystonia of the sphincter of Oddi was present in 12 patients, 11 of whom had hypotonia and were treated by a right splanchnicectomy. The 12th patient, who had hypertonia, was successfully treated by vagotomy. None of the patients in this series presented the necessary indications for sphincterotomy. No evidence was found to support the theory that the pancreatic lesions are the result of a narrowing of the duct of Wirsung.

There were three deaths and one patient was lost to follow-up, leaving 34 in whom evaluation of the late functional results was possible. The results were perfect from the outset in 26 patients and after a slight delay in 5; in the other 3 they were good, but although pain was relieved certain functional disturbances persisted. There were no late failures. These statistics show that chronic relapsing pancreatitis can usually be treated effectively and that left splanchnicectomy not only has wide applicability to patients with this condition but may even be regarded as curative because it arrests the progress of the lesions.

NEUROLOGY & PSYCHIATRY

Infantile Hemiplegia and Hemispherectomy. J. Achslogh, F. Sody-Farber and P. Van Reeth. Acta paediat. belg. 10:53-68 (No. 2) 1956 (In French) [Brussels, Belgium].

The term hemispherectomy is expressive but inexact, because the procedure to which it refers is actually a hemidecortication that respects the central gray nuclei. The first series of patients in whom hemispherectomy was performed for epilepsy with infantile hemiplegia and personality disturbances was reported in 1950 by Krynauw. Similar reports have since been published by other workers, and the number of patients treated by this procedure must now exceed 100. Infantile hemiplegia may begin at birth, usually as the result of an obstetric accident, or it may appear during the first four years of life as a sequel to an inflammatory or vascular disease of the central nervous system, accompanied or not by convulsions and usually febrile. It may appear abruptly without premonitory symptoms or fever. The chronic stage is marked by the symptomatic triad of hemiplegia, epilepsy, and personality disturbances. The anatomic lesions, which include atrophy of the white matter and the gray matter in the hemisphere on the side opposite the hemiplegia, vary widely in extent and in intensity. The hemiplegia is spastic and more pronounced in the arm, which is held in flexion with the fist closed. Walking is usually possible, though irregular and accompanied by claudication. Sensitivity to touch and pain are for the most part preserved but diminished; deep sensitivity, on the other hand, is profoundly disturbed. Hemianopsia is sometimes present. Speech is preserved, though it may be below that of a normal child of the same age if the dominant side is affected. The mental state varies from nearly normal to severely deficient. Personality disturbances, which are almost always present, are often so pronounced that the child must be placed in a psychiatric institution. Epilepsy, when present, may be either focal, with one or more foci, or generalized, occasionally, however, it is absent. The best indications for hemispherectomy are found in patients with spastic hemiplegia, focal epilepsy, and personality disturbances, but the operation may be performed on patients in whom either epilepsy or personality disturbances are lacking. Each patient should be carefully evaluated, and the operation should not be undertaken without the assurance that the hemisphere to be retained is functionally normal.

The operative technique preferred by the authors is that described by Achslogh and Ectors; it consists of a rigorous decortication with complete preservation of the central gray nuclei. The effect of the operation on the sensory disturbances is slight. Aphasia never appears, but hemianopsia is complete and definitive, although the central vision is not affected and the patient is usually unaware of the defect. The major result of the operation is unquestionably the disappearance of epilepsy in almost all cases. This disappearance is accompanied by a significant reduction in the aggressiveness often dominant in these patients. The beneficial effect of hemispherectomy may be illustrated by the case of a 10-year-old girl who had had a right-sided infantile hemiplegia from the age of 13 months on, which was accompanied by epilepsy, slight aggressiveness, and moderate mental deficiency. A left hemispherectomy was followed by the complete disappearance of the epilepsy, the hemiplegia became less spastic; the aggressiveness diminished, and there was even a slight mental improvement. The neurophysiological problems connected with the mechanism by which these effects are secured are still unresolved, but they may well lead to a revision of opinions previously held. Hemispherectomy or hemidecortication is certain to become the operation of choice in the treatment of infantile hemiplegia.

Lithium Therapy in Mania: Practical Lines of Guidance. M. Schou. Nord. med. 55:790-794 (June 17) 1956 (In Danish) [Stockholm, Sweden].

In 69 out of 85 manic patients treated with lithium to date the manic symptoms disappeared or abated during the treatment; in 16 patients the treatment was without effect. Spontaneous variations are characteristic of manic-depressive psychoses, but in one-third of the cases the improvement is attributed to the lithium. Every psychosis with definitely manic features is an indication for treatment with lithium, but since the effect sets in rather slowly in the course of one or two weeks, it is often preferable in first-time mania and in patients with infrequent brief manias to await spontaneous improvement or to use electroshock. The treatment seems to be without effect in endogenous depressions. In conditions where serpasil and chlorpromazine are of undoubted therapeutic value the effect of lithium is slight or uncertain, but its effect in especially protracted or frequently recurring manias offers advantages over other forms of treatment. A tablet contains 0.3 gm. of lithium carbonate. A beginning dosage of 2 tablets two or three times daily is advised. After one or two weeks treatment can usually be continued with a maintenance dose of 1 tablet three times daily, the final dose being determined by the effect on the psychic condition, the lithium concentration in the blood, and possible symptoms of overdosage (nausea, diarrhea, strong tremor of the hands). A reasonable intake of salt must be insured, and the water intake must be adequate. Therapy with the substance should be discontinued if the salt or water intake fails during the treatment. During the treatment determination of the lithium concentration in the blood every two weeks is sufficient; flame photometric determination is simple and quick. Diseases of the heart and kidneys and conditions leading to low salt intake are contraindications. No late effects have been observed on administration for over three years.

GYNECOLOGY & OBSTETRICS

Torsion of the Human Pregnant Uterus. R. E. L. Nesbitt Jr. and G. W. Corner Jr. Obst. & Gynec. Surv. 11:311-332 (June) 1956 [Baltimore].

A 32-year-old Negro woman was hospitalized because of right lower quadrant pain associated with a right lower quadrant mass and amenorrhea of 11 weeks. Her history revealed two fleeting episodes of stabbing right lower quadrant pain two weeks prior to admission followed by constant "drawing" right lower quadrant discomfort. On pelvic examination the uterus appeared to be in the midline and felt a little large for the duration of the amenorrhea. There was a hard, nontender, 3-to-4-cm. mass, which was inseparable from the uterine wall and which arose deep in the pelvis and reached almost to the umbilicus. Examination under anesthesia demonstrated a 4-cm. globular mass apparently in the right lateral uterine wall and a 6-cm. globular mass apparently attached to the right cornu of the uterus. These findings suggested either a right interstitial pregnancy or a degenerating myoma at the right cornu. Upon the opening of the abdomen through a lower midline incision, an obviously pregnant uterus of at least 11 weeks' size and slightly more cyanotic than usual was encountered. A bilobed subserous myoma was found in the right lower quadrant at the left cornu of the uterus. The 180-degree torsion of the uterus upon the cervix was corrected manually, whereupon the increased cyanosis of the uterus disappeared. The woman made nine subsequent prenatal visits and was asymptomatic. During labor, which occurred at the 36th week of gestation, the uterus was noted to be in 90-degree torsion. However, this torsion did not interfere with the labor. During her hospital stay, the uterus remained in normal position. The patient has had a subsequent uneventful pregnancy.

Reviewing the literature on torsion of the pregnant uterus, the authors found that this relatively rare accident of pregnancy has now been reported 107 times. In 30% of the women torsion occurred in association with myomata uteri and in 15% with uterine anomalies. Ovarian cysts, adhesions, uterine suspensions, abnormal fetal presentations, fetal anomalies, and abnormalities of the spine and pelvis are also reported to be etiological factors in torsion of the pregnant uterus. The diagnosis of torsion of the uterus is seldom definitely established prior to laparotomy. The treatment of symptomatic torsion of the pregnant uterus is immediate laparotomy and detorsion. Contrary to the opinion commonly expressed, cesarean section with or without hysterectomy may not be necessary except in the most advanced degrees of torsion. When the accident occurs near term or during labor, cesarean section may be the procedure of choice. However, simple detorsion together with surgical removal of the causal abnormality seems sufficient in many cases, especially in the earlier months of pregnancy. Prompt surgical intervention coupled with adequate blood replacement and chemotherapy has resulted in a reduction in maternal mortality in recent years, but torsion of the pregnant uterus after the fifth month of gestation is still accompanied by considerable maternal risk.

The Use of the Routine Vaginal Smear as a Screening Test for Uterine Carcinoma. J. H. McClure, W. L. Caton and G. Lucchese. J. M. A. Georgia 45:305-308 (July) 1956 [Atlanta, Ga.].

The investigations described were carried out in order to determine more accurately the prevalence of uterine carcinoma in patients seen on the gynecologic service of Emory University at Grady Memorial Hospital, Atlanta, Ga., and to compare the "routine" vaginal smear method of screening for carcinoma of the uterus with the method of "biopsy on clinical suspicion." The population group seen on this service is predominately indigent urban Negro. A total of 670 patients was seen during the one-month period. Of these patients, 452 were Negro and 218 white. Forty of the 670 smears were interpreted as malignant. During the period covered by this study, 84 patients had a four-quadrant cervical forceps-biopsy done because of "clinical suspicion." Ten of these 84 biopsies were positive (five invasive carcinomas of the cervix and five in situ carcinomas of the cervix). The smears of 9 of these 10 patients had previously been interpreted as malignant. An attempt was made to obtain follow-up examinations on the remaining 31 patients.

Schiller tests and four quadrant cervical biopsies were obtained in 27 of the 31. A total of 18 of the 670 patients were found to have cervical carcinoma, and in eight of these the diagnosis was made solely because of the routine cervical smear test. Seven had invasive and 11 had in situ carcinoma. Five of the six patients with clinically unsuspected in situ carcinoma of the cervix were under 26 years of age. Only one of the six patients with unsuspected in situ carcinoma of the cervix had a positive Schiller test.

PEDIATRICS

Hemolytic Disease of Newborn Infants Due to ABO Incompatibility: Twelve Cases Treated by Exchange Blood Transfusion. O. Mellone, D. Delascio, P. Refinetti and others. Rev. paulista med. 48:266-278 (March) 1956 (In Portuguese) [São Paulo, Brazil].

Twelve newborn infants with hemolytic disease due to ABO incompatibility were observed. The blood groups of mothers and infants were as follows: type O, Rh positive in 10 women and type A, Rh positive in their infants; type O, Rh negative in a woman and type A, Rh positive in her infant; and type B, Rh negative in another woman and type AB, Rh negative in her infant. Two women were primiparas who had not previously had blood transfusions, but one of them had had an injection of anti-Arachnidia serum at an early period of pregnancy. Five women had previously had one or more infants with jaundice and anemia immediately after birth for which the infants received blood transfusions. The five infants got well, three without sequels and two with neurological sequels. The remaining five women had previously had either normal infants or still-born fetuses. The symptoms followed the pattern that differentiates ABO incompatibility from Rh incompatibility: Severe jaundice and anemia appeared immediately after birth or within the first 12 hours of the infant's life, with or without erythroblastemia and splenohepatomegaly. The course of the acute forms is the same as that of the disease caused by Rh incompatibility, associated with acute hemolysis. The acute symptoms consist of rapid aggravation of the patient's condition, with changes in temperature, disorders of respiration, and neurological symptoms and coma from kernicterus.

The treatment consisted of exchange blood transfusion, given intraumbilically in 10 cases and by the radial artery in 2. An average dose of 800 cc. of erythrocytes in saline solution was given. Immediate results were excellent for the nine patients who had the treatment within the first two days of the disease. All the patients recovered without sequels. Of the remaining three patients, one died from complications of umbilical hematoma. Two patients had the treatment starting on the fourth and fifth days, respectively, in the course of kernicterus. One patient died and the other recovered with neurological sequels. The nine patients who recovered without sequels have been observed for nearly two years. They are normal.

Hemorrhagic Adrenal Glands in the Newborn. P. Salomone. Minerva pediat. 8:675-687 (May 5) 1956 (In Italian) [Turin, Italy].

The author reports on 12 cases of acute adrenal hemorrhage in newborn babies. The most frequent cause of adrenal hemorrhage is difficult delivery in combination with one or more other causes, e. g., asphyxia, conditions that required intervention with forceps, and pathological pregnancy. None of the babies was born after a completely physiological pregnancy or delivery. Some factor that had caused the hemorrhage was present in each baby. Hemorrhage could also be considered as the result of nonadaptation of the baby to the stress of the birth. In almost all cases hemorrhage was present, not only in the adrenal gland but also in some other part of the body: the lungs, the intracranial organs, the digestive system, the spleen, the thymus, the liver, or the testes. The lungs were involved 8 times in 12 cases; in some cases with hemorrhage, in others with pneumonia or atelectasis. Male babies were affected more than female babies.

A Clinical Contribution to the Study of Congenital and Acquired Toxoplasmosis. A. Gentili. Riv. clin. pediat. 57:197-211 (Feb.) 1956 (In Italian) [Florence, Italy].

The author describes a case of congenital toxoplasmosis and one of acquired toxoplasmosis. The first patient presented all of the classic symptoms of the disease: chorioretinitis, intracranial calcifications, and hydrocephaly. The mother of the patient showed no symptoms of toxoplasmosis, but the author thinks that it is possible for an individual to have toxoplasmic infection without the manifestation of symptoms. The patient, who is now 6 years old, has been under observation since she was 7 months old. Treatment with sulfonamides stopped the evolution of the symptoms: the ocular lesions regressed and the hydrocephalic syndrome became stabilized. With the exception of chorioretinitis, the child is today in good physical and psychological condition. The child has never exhibited convulsive phenomena, and neurological examination has always been negative.

The patient with acquired toxoplasmosis contracted the disease at 9 years of age. Chorioretinitis was the only classic symptom present. Hemorrhages were absent. The course of the disease was afebrile. Serological examinations were made on the father, mother, and younger sister of the patient, none of whom exhibited any clinical manifestations. These examinations revealed the presence of antibodies. The author thinks this was due to an infection, without symptoms, that the whole family had contracted.

Early Diagnosis of Bone and Joint Tuberculosis in Children. T. J. Mills, R. Owen and E. H. Strach. Lancet 2:57-59 (July 14) 1956 [London, England].

The authors review observations on 60 patients in whom biopsy was performed to differentiate tuberculous from nontuberculous lesions of the bones and joints. Patients in whom the diagnosis was sufficiently obvious to preclude the need for biopsy were excluded. The following types of biopsy were carried out: aspiration of either a joint cavity or an abscess in 26 patients; biopsy of regional lymph nodes in 39 patients; joint biopsy of the synovial membrane in 31 patients; and bone biopsy in 11 patients. The patients were divided into three groups: in the first group of 35 patients tuberculosis was proved; in the second group of 20 patients the lesions were nontuberculous; and in the five remaining patients (third group) the lesion were not identified. In the first group biopsy established the diagnosis of tuberculosis beyond reasonable doubt in that the bacillus was isolated in 21 patients or the histology was typical of tuberculosis in 32 patients. In the second group the nontuberculous nature of the lesion was demonstrated by biopsy and the subsequent clinical course.

The decreasing incidence of tuberculosis at present underlines rather than diminishes the necessity for early biopsies. By following a policy of early biopsy the tuberculous or nontuberculous nature of the condition can be established promptly with a view to effective treatment. The authors feel that their mistakes have been mostly due to inadequate examination. They emphasize the fact that in all biopsies the material obtained must be submitted to histological examination, culture, and guinea pig inoculation.

Observations on Leprosy Among Children Born in the Culion Leper Colony During the Presulphone and the Sulphone Periods. C. B. Lara and J. L. Ignacio, J. Philippine M. A. 32:189-197 (April) 1956 [Manila, Philippine Islands].

This study was prompted by a suspicion that there has been some insidious change in the prevalence and character of leprosy among children during recently years at the Culion Leper Colony. The authors compared the incidence of leprosy among the children born in the colony in two eight-year periods. While at first glance the comparison between the period of chaulmoogra therapy (1933 to 1940) and the period of sulfone therapy (1947 to 1954) shows no appreciable difference in the incidence of leprosy among colony children, a more detailed analysis reveals a probable lower rate of incidence during the sulfone period. An increased average "age at onset" for all types of lesions, as well as a relative increase in the later developing types, especially the macules, supports this view. Whether the lower rate was actual or merely a manifestation of a lag in the incubation period, and whether it was influenced by the fairly widespread, nonintensive use of the sulfones or some other cause cannot be determined.

Hyperthyroidism in Newborn Infant: Report of Case and Review of Literature. A. J. Aballi, N. Casanova, A. Pacheco and Frank Lavernia. Rev. cubana pediat. 28:339-350 (June) 1956 (In Spanish) [Havana, Cuba].

Children born to women with hyperthyroidism, as a rule, do not suffer from the disease. The case reported by the author is the 14th in the literature. The mothers reported on in the literature had thyroid disorders during pregnancy. Ten mothers with active thyrotoxicosis had been treated with iodine or thiouracil during pregnancy, and four had undergone a thyroidectomy that resulted in hypothyroidism in one patient. The infants were boys, and all were slightly premature. The period at which hyperthyroidism appeared was variable. A diagnosis of hyperthyroidism was made in one infant during the mother's pregnancy because of the marked tachycardia perceptible in the fetal heart. In the remaining cases the diagnosis was made immediately after birth or within the first and fifth weeks of life of the infant. The symptoms were those of marked irritability, tachycardia, enlarged thyroid, and marked exophthalmos. Ossification was slightly accelerated. The electrocardiograms showed changes characteristic for hyperthyroidism for that age. The main complications were cardiac insufficiency, bronchopneumonia, and liver disease, However, the complications were rare and controllable, and the disease manifested a tendency toward spontaneous and rapid regression without treatment. The mother of the patient reported on had hyperthyroidism for which she received treatment beginning in the third month of pregancy and continuing with interruptions through the following months. The treatment consisted of administration of Tapazole (imidazole derivative) and Lugol's solution (iodine). The infant was normal at birth but showed marked symptoms of hyperthyroidism within the first week of life. It recovered within a few weeks without any specific treatment.

Acute Fetal Ichthyosis: Case with Survival of Infant for More Than One Year. H. Garces and F. Donoso. Rev. Chilena Pediat. 27:158-162 (April) 1956 (In Spanish) [Santiago, Chile].

Acute fetal ichthyosis consists of diffuse hyperkeratosis and cornification of the epidermis, the other layers of the skin being normal. The epidermal abnormality results in the formation of thick horny scales and red sulci on the skin from head to foot. The disease is rare. The cases reported in the literature have been observed in premature infants, mostly from parents who were interrelated. The etiology is not known. It is believed to be hereditary. Death occurs in almost all cases within the first few hours after birth. The case reported by the author is the fourth published in the literature of Chile. The parents were not related. The mother had previously had three normal children. The lesions in the infant girl were typical of the severe acute form of ichthyosis. She had neither hair nor eyebrows. There were skin abnormalities about the mouth, the nose, and the eyes. She was treated with antibiotics (terramycin, 30 mg. per kilogram of body weight daily), cortisone (37 mg. daily), and vitamin A (20,000 units daily) for one month, and care of the skin with medicated petrolatum. At the end of one month, treatment with antibiotics and cortisone was terminated and only treatment with vitamins A, C, and D and care of the skin was continued. Recurrent respiratory infections were frequent complications. The infant was cared for in the hospital for five months. She lived for more than one year. It is possible that cortisone had some effect on the patient's survival by increasing her strength. The drug had no effect on the skin lesions. The abnormal epidermal layer was detached from the infant's body once, only to be replaced by another layer with the same abnormal characteristics.

Semiologic Considerations on Myasthenia Gravis: Report of Case. E. O. Lis and A. Giancia. Arch. oftalm. Buenos Aires. 31:145-148 (May) 1956 (In Spanish) [Buenos Aires, Argentina].

Myasthenia gravis is rare in children. The subject of this report, a child 7 years old, suffered from frequent episodes of respiratory infections of an asthmatic type after which his ability to move was greatly diminished. Motor incapacity lasted for about 10 days after vaccination and again after an attack of parotitis. His gait was unnatural, as if he had no strength in his legs. At the age of 7 he developed a pronounced exophthalmos and limitation of the eye movements. He also exhibited tremor of the hands, great asthenia, dysphagia, difficulty in voiding and in defecating, and lastly palpebral ptosis appeared. The electrocardiogram showed changes suggestive of neurocirculatory asthenia. The prostigmine test gave positive results, and treatment with prostigmine controlled the acute symptoms.

Genuine Cirrhosis of Liver in Infants. K. Lambers and H. Richter. Ztschr. Kinderh. 78:60-70 (No. 1) 1956 (In German) [Berlin, Germany].

Cirrhosis of the liver is rare in infants less than 3 months old, but when it occurs, macroscopic and microscopic studies on the liver of these infants suggest that the condition is usually one of the following three: interstitial syphilitic hepatitis of the newborn, cholestatic cirrhosis in the presence of congenital atresia of the bile duct, or a manifestation of hemolytic disease of the newborn. Since the occurrence of hepatic cirrhosis in hemolytic disease of the newborn was not recognized until 1934, it is assumed that the majority of familial, etiologically obscure cases of hepatic cirrhosis in infants before that time were caused by hemolytic disease of the newborn. In addition to the three forms of cirrhosis mentioned, there occur in young infants (often in several in one family) hepatic lesions characterized by intra-acinar cirrhosis. Although this process is histologically similar to the hepatic cirrhosis resulting from Rh incompatibility, a definite relationship to hemolytic disease of the newborn cannot be demonstrated.

The authors report observations on an 8-week-old infant with hepatic cirrhosis. Another infant in this family had died six years previously (12 days after birth) with signs of severe jaundice. The symptoms were similar in the two children, except that in the first the course was somewhat more fulminant and the jaundice more severe. In the second infant the liver was enlarged and was of the hobnail type. Hyperglycemia, glycosuria, and galactosuria existed throughout the course of the disease. The disorder of the first infant was diagnosed as hepatic jaundice with enlargement of the liver, whereas the second case was identified as infantile cirrhosis of the liver. Histological examination revealed in the first child diffuse fatty degeneration of the liver with inflammatory infiltration of the interstitial cells, that is, the pathological process was relatively recent; whereas in the second child the liver showed a characteristic, diffuse intra-acinar cirrhosis. It is possible that the primary cause was the same in both infants and that cirrhosis developed in the second infant because of the more prolonged clinical course. The authors found seven similar cases reported in the literature. They suggest that these are cases of genuine cirrhosis of the liver that should be differentiated from the above-mentioned forms in which the causation is established.

UROLOGY

A Clinical Study of the Motor Paralytic Bladder in Poliomyelitis. B. G. Clarke. J. Urol. 76:66-69 (July) 1956 [Baltimore].

In spite of the relative frequency of urinary retention in patients with poliomyelitis there is little material in the literature on which to base an understanding of the physiological disturbances that occur. In 13 patients, bladder paralysis appeared concurrently with peripheral skeletal muscle paralysis during the acute, febrile stage of poliomyelitis. Distribution of peripheral paralysis had no relation to segmental location of bladder motor innervation. Among the adults capable of describing sensation, micturitional disturbances assumed the form of painful urinary retention. Large volumes of residual urine were obtained. Ileus of varying degrees of severity developed concurrently with difficulty in voiding. In two patients who died, no histological abnormality of the muscle, nerves, or ganglia of the bladder wall could be found. Paralysis of the abdominal striated muscles was present in only half of the patients. The authors find indications that the urinary retention of poliomyelitis is the result of detrusor weakness without sensory loss. It may simply reflect motoneuron changes, usually reversible, in the lateral columns of the sacral segments of the spinal cord, from which originate the parasympathetic motor nerves of the bladder. In surviving patients, normal bladder function returned during defervescence and beginning recovery from skeletal muscle paralysis. In the younger patients, simple measures such as manual expression of the bladder, administration of parasympathomimetic drugs, or one or two catheterizations sufficed for treatment. In the adults, indwelling catheter drainage during the phase of bladder paralysis was used successfully until return of normal bladder function.

Longevity Following Nephrectomy. A. E. Goldstein. J. Urol. 76:31-41 (July) 1956 [Baltimore].

The author reports a study in detail of the outcome of 391 cases of patients who underwent nephrectomy from 1918 to 1954 inclusive. The average life span after operation for renal tuberculosis was slightly more than 13 years in patients living until 1955, whereas in those who died before 1955, it had been only 2.7 years. The average length of life after nephrectomy for neoplasm among patients living in 1955 was 4.7 years, while among those who died prior to 1955 the survival was approximately 4.1 years. A nephrectomized patient can live a normal life, and there will be no interference with longevity except in those in whom nephrectomy was performed because of tuberculosis or neoplasm. In this study, patients who underwent nephrectomy for neither of those conditions and who were living in 1955 were healthy and had lived an average of 10.1 years since operation. Of the 122 traced patients subjected to nephrectomy after 50 years of age, 66% have already lived their average span of life of 65, and many more have gone beyond the average span of life. Patients undergoing nephrectomy can reach the average span of life of 65 years provided the opposite kidney is in good condition at the time of operation. The author hopes that nephrectomy can be avoided in some cases with the aid of newer drugs. Experience and judgment will help in the conservation of renal tissue with a view to increasing the survival rate. Although nephrectomized patients who did not have renal tuberculosis or neoplasm are no greater risks than other people, they are given higher insurance rates because insurance companies confuse these surgical diseases with the various types of nephritides, which certainly create poorer risks.

Present-Day Concepts of Polycystic Renal Disease: Analytic Studies of 67 Cases. P. Vallery-Radot, P. Milliez, C. Laroche and others. Semaine hôp. Paris 92:2232-2237 (June 30) 1956 (In French) [Paris, France].

Polycystic renal disease may be present for a long time without causing much discomfort. It is usually isolated and may be hard to detect. Death occurs as a rule about 10 years after appearance of the first serious functional symptoms and is usually due to severe renal insufficiency. Arterial hypertension is present in three-fourths of the cases, but death is rarely linked to a cerebral or coronary vascular accident. The first symptoms are variable and may consist of vague lumbar or abdominal pains, severe nephritic pains, hematuria with or without pain, albuminuria not associated with another disease, pyuria, arterial hypertension, or azotemia revealed by great debility and excessive thirst. In two-thirds of the 67 patients in the present series, the first symptoms were lumbar pain, hematuria, and arterial hypertension. The pa- tients ranged in age from 9 to 70 years and were almost equally divided as to sex (33 men). In most of the patients the kidneys were abnormally palpable. Bacillus coli was the organism most commonly found in the urine of patients with pyuria, but entero- cocci, staphylococci (micrococci), and streptococci were also pres- ent in some cases. The diagnosis of polycystic renal disease was confirmed by palpation in 21 cases and by radiology in 41. The pathogenesis of polycystic renal diseases was not clarified by observations in these cases.

Primary Tumors in Ureter and Renal Pelvis with Analysis of 12 Cases. F. Lund and F. Lundwall. Ugesk. læger 118:615-621 (June 7) 1956 (In Danish) [Copenhagen, Denmark].

From 1939 to 1954, papillomas or carcinomas in the ureter or renal pelvis were diagnosed in 12 patients, 11 men and one woman, aged from 41 to 74. Medical aid was sought because of hematuria, often sparse and intermittent. In 10 cases the diag- nosis was made preoperatively by intravenous urography, direct pyelography, or retrograde pyelography. The authors' investiga- tions show epithelial tumors in the upper urinary tract, whether histologically benign or malignant, to be particularly malignant in their clinical course, with a marked tendency to metastasize to the lower part of the urinary tract. On diagnosis, nephroureter- ectomy with partial cystectomy must be done, provided the other kidney functions satisfactorily. In five patients operated on radically there has been no recurrence during observation for from 1 to 11 years. The danger of superfluous operation is com- pensated for by the favorable results of the more radical opera- tion. The aim must be to find a more refined and certain method of establishing these tumors preoperatively and to sharpen at- tention to the presence of tumors in ureter and renal pelvis in patients with hematuria of unknown cause or with papillomas of the bladder, especially multiple papillomas centered around the ureter ostia.

Conservative Treatment of Acute Grave Renal Insufficiency: Review. P. Anthonisen, C. Brun and C. Crone. Ugesk. læger 118: 617-653 (June 14) 1956 (In Danish) [Copenhagen, Denmark].

From August, 1954, to March, 1956, 73 patients with acute anuria were treated in the Kommunehospital in Copenhagen. The anuria was due to obstruction in the urinary tract in 10 patients and to an acute flare-up of chronic renal disease in 5. The remaining 58 had acute ischemic anuria, most often from shock or complicating operations or severe barbiturate intoxica- tion. In 26 cases hemodialysis had to be resorted to; 4 of the other 32 patients died within 24 hours, and 16 of the 28 given conservative treatment exclusively survived. The purpose of conservative treatment of acute renal insufficiency is maintenance of the organism's internal milieu under conditions in which the water and electrolyte elimination is gravely compromised or has stopped and in which the elimination of residual products from the protein metabolism is almost suspended. The patient with anuria is almost always in a state of excessive catabolism. At least 100 gm. of glucose are to be given daily, and as soon as possible, i.e., when the renal function rises to somewhat more than 5%, protein substances should be given for building up the organism's tissue. Water is to be supplied in such amounts that there will be a daily loss of weight of about 0.5 kg. The amount of electrolytes supplied corresponds to what is lost through vomiting and diarrhea. Blood transfusions because of threatening or manifest shock must be given with extreme care Acute hyperkalemia can be temporarily combatted by infusion of glucose with insulin, together with injection of calcium salts Prophylaxis against infection is of the greatest importance. The clinical symptoms accompanying acute renal insufficiency depend more on disturbances in the water and electrolyte relations than on the accumulation of metabolic products containing nitrogen. If the blood urea level tends to rise above about 400 mg per 100 cc. the treatment must be supplemented by hemodialysis, but the fact that conservative treatment is the basic principle of treatment for all patients with acute anuria is stressed

Experiences with Hemodialysis: Thirty-Four Consecutive Patients. *P. Anthonisen, C. Brun, C. Crone, and others Ugesk læger 118:653-669 (June 14) 1956 (In Danish)* [Copenhagen, Denmark].

In the 18-month period ending in March, 1956, a total of 34 patients were treated with 55 dialyses in the Kommunehospital in Copenhagen. Dialysis was done in 26 patients because of uremia threatening life or hyperkalemia in connection with acute ischemic anuria; only one survived of the 14 most gravely affected, in whom the picture was dominated by the primary disease as well as by the uremia. Six of the 12 who also had acute anuria and grave uremia but in whom the primary affec- tion had receded survived. In the remaining eight patients with uremia or intoxications from various substances the immediate results of dialysis were good. In the most severe cases even the most energetic conservative treatment will not avail and hemo dialysis is necessary. The contraindications are few and relative, since the patients concerned are patients who without dialysis have a highly unfavorable prognosis. Persistent or more recent internal bleeding is a relative contraindication. Dialysis treat- ment cannot be separated from the conservative therapy The artificial kidney can be used only by a trained and experienced personnel, and both forms of treatment are best applied in clinical centers.

OPHTHALMOLOGY

Toxoplasmic Uveitis: Treatment with Pyrimethamine and Sulfa- diazine. C. J. Burnham and V. A. Beuerman. Am J Ophth 42 217-227 (Aug.) 1956 [Chicago].

Seven male and two female patients between the ages of 12 and 27 years with active uveitis were treated with pyrimethamine (Daraprim) and sulfadiazine All patients had a positive reaction to toxoplasmin skin tests Treatment was started with doses of 25 mg. of pyrimethamine two, three, or four times daily and with doses of 0.5 gm of sulfadiazine two or four times daily These doses were reduced gradually. Most of the patients were hospitalized for treatment. The duration of the treatment ranged from 1 to 10 months Some of the patients are still receiving treatment Four patients showed marked improvement within a week, which continued to quiescence of their lesions Four of the patients showed improvement varying from slight to marked over a longer period of time. One patient showed no response to therapy and in retrospect should probably not have been included in the group, although he had a positive reaction to the toxoplasmin skin test, the patient's father had died of tuberculosis, and the patient's disease was confined to the ante- rior segment (iridocyclitis). All the patients were carefully watched for toxic reactions to the drugs. Depression of the mor- phological elements of the blood did not occur in any of the patients. One patient had urticaria, which was presumably caused by the drugs; it was controlled by antihistaminics, allowing continuation of the therapy. The only other complications were slight anorexia and nausea.

Although the toxoplasmic causation of chorioretinitis in adults has been proved, the available diagnostic methods are fallible and in most cases the diagnosis of toxoplasmic chorioretinitis must be presumptive at best. The average ophthalmologist, not associated with a research facility, does not have available repeated serial Sabin dye tests; the combination of careful history and examination of the patient, a thorough attempt to rule out other granulomas as causative, and in addition a positive reaction to the toxoplasmin skin test is probably his best approach to making a presumptive diagnosis of toxoplasmic chorioretinitis. The decision to treat or not to treat a patient with presumptive toxoplasmosis should be made by the individual ophthalmologist and should probably be based partly on the severity of the patient's condition. It should not be begun without adequate supervision in regard to possible toxic effects from these drugs. Although there were no severe reactions to pyrimethamine and sulfadiazine in the small group of patients reported on by the authors, toxic reactions, including temporary but severe depression of the hematopoietic system, have been reported.

Epidemic Keratoconjunctivitis: Description of an Outbreak in an Institution for the Aged. J. Schneider, A. Kornzweig and M. Feldstein. Am. J. Ophth. 42:266-269 (Aug.) 1956 [Chicago].

An outbreak of epidemic keratoconjunctivitis in one of the units of the Home for the Aged and Infirm Hebrews of New York is described. It involved 16 men and women between the ages of 69 and 94 years. The clinical picture was characterized initially by a sense of irritation in the eyes, with redness and lacrimation. There was a varying degree of lid edema, chemosis, conjunctival redness, and redundancy with follicular hypertrophy. In three patients the discharge became serosanguineous, two patients had pseudomembranes with subsequent complete clearing, and one patient had true membrane formation with residual scarring of the fornices. The conjunctival phase of the disease lasted for from two to three weeks. The corneal lesions often started as diffuse, superficial, punctate staining lesions. Later round subepithelial infiltrates were observed in both the central and the peripheral cornea. Most corneal lesions cleared in about four to eight weeks. In six patients, however, corneal lesions were still present after 12 months. In most patients there was first involvement of one eye followed in a few days by symptoms in the other eye, probably related to the transfer of the infection from one eye to the other by the patients as they wiped their eyes despite repeated warnings. Special characteristics in this group were missing, except that the keratoconjunctivitis was uniformly acute, severe, and very disabling. The final vision in all patients returned to the acuity that was present before the infection.

The patients were strictly isolated and treated with 0.5% oxytetracycline (Terramycin) eye drops or 0.5% chloramphenicol (Chloromycetin) eye drops during the day, and oxytetracycline and chloramphenicol ointments were applied at bedtime. These antibiotics appeared to have no effect on the course or duration of the disease. Treatment is symptomatic and palliative. Preventive measures found useful are sterilization of tonometers by keeping the tonometer plunger in a solution of 1:5,000 benzalkonium chloride or by heat; the use of individual, boiled eyedroppers for each patient; preventing patients who are suspected of having the disease from touching arm rests, doorbells, and equipment in offices and clinics; and the surgical scrubbing of hands with a bactericidal detergent (Phisohex) by all who handle a patient suspected of having epidemic keratoconjunctivitis.

Mass Treatment of Trachoma in Nara Prefecture, Japan, 1951-1954. S. Kamiya. Am. J. Ophth. 42:269-283 (Aug.) 1956 [Chicago].

Lack of proper sanitation is the chief cause of trachoma in the Nara District in Japan, in which 6.8% of the total population belong to the lowest rank in the social order. These outcasts, most of whom have trachoma, live in isolated villages that are crowded and dirty. A four-year plan was instituted to wipe out trachoma. Between 1951 and 1954, 37 villages were chosen to test mass treatment of trachoma. A dispensary at the center of each village was open to all villagers for a period of one month. Although examinations were performed with the aid of a hand slit lamp, it was very difficult to make an exact diagnosis when the trachoma was still in its initial stages. Therefore, without exactly diagnosing trachoma, all persons who had chronic inflammatory signs of the conjunctiva were treated. An individual record card was prepared for each patient, with an evaluation of his clinical condition. Various conjunctival signs were graded by numbers. All patients were reexamined once a week and on the last day of the month; the numbers describing the conjunctival signs were recorded each time. Of 15,082 persons for whom record cards were made, 6,805 were between the ages of 1 and 15 years, 6,318 were between the ages of 16 and 54 years, and 1,959 were over 55 years of age. Of the 6,805 children, 5,129 were pupils in the primary and secondary schools; they were compelled by their schools to attend the dispensaries. Persons between the ages of 16 and 49 years had no time to attend the dispensaries regularly because of their daily work. Persons over 55 years of age did attend.

To most of the patients crystalline chlortetracycline (Aureomycin) ointment was administered once a day under the lower lid after the conjunctival sac had been washed out with 1% sodium chloride solution. The remaining patients were given oxytetracycline (Terramycin) and chloramphenicol ointment. Of 12,319 patients treated, 4,590 were cured. Three thousand seven hundred sixteen of the 12,319 patients had pretrachomatous conjunctival signs, i. e., slight redness near the inner and outer parts of the fornices, or some isolated follicles in the lower fornix; 2,744 of these 3,716 patients were cured by the treatment without having any residual traces of the disease, 937 remained unchanged, 26 became worse, and 9 were cured but left with traces of the disease. The remaining 8,603 of the 12,319 patients showed inflammatory conjunctival signs of various degree before the treatment. Some of them were cured by the treatment without residual traces of the disease, and some were cured but traces of the disease remained. The inflammatory signs of stage 2 of trachoma according to MacCallan's classification are more difficult to cure than the others. The highest incidence of trachoma stage 2 was observed in the patients between the ages of 16 and 54 years, so that it must have taken the disease 20 to 30 years to reach this stage. The traces that remained in patients who were treated for stage 2 lesions consisted merely of many fine lines. When patients with trachoma of stage 3 were cured, the traces of the disease that remained were still of a serious nature, and they appeared as irregular "islands."

Patients with pretrachomatous lesions, which are considered as stage 1 of trachoma in Japan, do not have typical trachoma but they should be treated, if efforts are being made to eliminate trachoma. Since the occurrence of trachoma depends not only on viral infection but also on unsanitary and dirty environments, both the patients and their families and the entire population of the village must be treated. Concentrated efforts to educate the people in sanitation, in addition to treating them, contributed to the remarkable results of mass treatment of trachoma.

THERAPEUTICS

A Preliminary Note on the Oral Treatment of Diabetes with N-(Sulfonyl-p-Methylbenzene) N'-n Butyl Urea or D 860 (A Product Free of Antibacterial Action). R. Moreau, R. Deuil, A. Sarrazin and others. Presse méd. 64:1261-1264 (July 7) 1956 (In French) [Paris, France].

The drug N-(sulfonyl-p-methylbenzene) N'-n butyl urea, or Tolbutamide (D 860), is the most recent among the hypoglycemia-inducing compounds orally effective in diabetic patients. In a group of 27 patients, 23 benefited from treatment by the drug. All except two were over 40 and nonemaciated. The patients were divided into two groups. The first group consisted of 14 patients who had never been given insulin. Nine of them obtained a perfect balance without any symptom of intolerance after two or more months of treatment. Three had an incomplete improvement. In the last two patients, one of whom had had diabetes for 21 years, treatment with Tolbutamide was a failure. The second group consisted of 13 patients who had previously been treated by insulin. Eight of these patients, who had received [illegible] for from two to four years, obtained a balance at least equal to and sometimes superior to that resulting from insulin therapy. Three of the cases in the second group were particularly interesting, one because of the patient's age and two because of use of very large previous insulin doses. A 16-year-old girl successfully substituted 2 gm. of Tolbutamide for 15 units of insulin. Of two women over 60 years old, one had received 40 units of insulin daily for one year and the other had received 55 units for 11 years, and both successfully substituted Tolbutamide for insulin. The last two patients (one under age 40), who tried Tolbutamide unsuccessfully, were put back on insulin therapy after 48 hours because of a considerable quantity of ketone bodies in the urine.

Tolbutamide does not possess any NH_2 group in para position in its chemical structure. It has no obvious antibacterial action. This quality is an unquestionable advantage when the drug is to be used in a prolonged fashion. Tolbutamide shows a clinically demonstrated hypoglycemia-inducing potency. It is well tolerated, as evidenced by comparative biological tests that show no subsequent hematological, hepatic, or renal disturbances. Its prolonged administration does not cause any digestive disorders or any cutaneous eruption. Average and continued dosage should be 1 gm. in the morning and 1 gm. at noon. Hospitalization is advised for changing from insulin to Tolbutamide therapy. It seems preferable to diminish insulin gradually while carefully watching for ketosis or hypoglycemia. The latter is possible through the accumulation of the two medicaments. If ketosis appears, insulin should be taken again in the usual dosage. Tolbutamide may allow insulin dosage to be reduced in young patients with recent diabetes. The type of response to the drug may allow determination of the variety of diabetes in a patient. A long-term follow-up study will be the only means of ascertaining the innocuousness of the drug and its hitherto unknown mode of action. The possibility of treating diabetes without parenteral injections is an interesting development.

Mestinon (Pyridostigmine Bromide) in Myasthenia Gravis. H. Schwarz. Canad. M. A. J. 75:98-100 (July 15) 1956 [Toronto, Canada].

Pyridostigmine bromide (Mestinon) was given to 14 patients with myasthenia gravis. The drug is about five times less toxic than neostigmine bromide, and its effect on the intestines is only half as strong as that of the latter. It is an excellent curare antidote, but its decurarizing effect is quite independent of its inhibitory effect on the cholinesterases. Pyridostigmine proved to be more effective than neostigmine in seven patients because of its superior ability to control myasthenic phenomena and the absence of side-effects after prolonged use. In two of the seven patients, abrupt withdrawal of the drug and its replacement by neostigmine produced severe gastrointestinal upset, and in two others it caused a sudden exacerbation of myasthenia that could not be controlled with increasing amounts of neostigmine. Combined treatment with pyridostigmine and neostigmine in three patients was superior to treatment with either pyridostigmine or neostigmine alone. Two patients were unchanged, and in the remaining two patients the results obtained with pyridostigmine were inferior to those obtained with neostigmine. Sixty milligrams of pyridostigmine can be safely substituted for 15 mg. of neostigmine, although in patients responding well to the former this ratio is frequently much less. The patients were studied for one year, and at no time during this period was there any evidence of parasympathomimetic stimulation or cholinergic phenomena, even when high doses of pyridostigmine were given for long periods of time. Pyridostigmine, either alone or in combination with neostigmine, is the drug of choice in most patients with myasthenia gravis, because some patients resistant to prostigmine have shown an excellent response to pyridostigmine and because the drug appears to be relative nontoxic.

Prednisone and Acetylsalicylic Acid in the Treatment of Rheumatic Affections. A. Robecchi, V. Danco and G. Marrazzi. Reumatismo 8:121-129 (May-June) 1956 (An Italian) [Turin, Italy].

Thirty patients with rheumatic affections were treated with a combination of prednisone and acetylsalicylic acid. The formula of the combination was prednisone 1 mg., acetylsalicylic acid 250 mg., ascorbic acid 50 mg., and aluminum hydroxide 200 mg. Ascorbic acid provides the vitamin C necessary in the treatment of chronic or acute rheumatism. Aluminum hydroxide prevents the gastric complications that acetylsalicylic acid or prednisone might cause. Of the 30 patients, 14 had rheumatoid fever, 6 arthrosis of the knee, 4 acute periarteritis of the shoulder, one a painful involvement of the shoulder joint, and 5 rheumatic infection. The minimal dose of prednisone able to maintain a certain clinical improvement and the erythrocyte sedimentation rate at law values was established. Treatment with the combination was started, and the dose of prednisone was cut down to one-third. The combination was given in divided doses from two to four times a day. Dietary restrictions were not imposed. Tolerance was perfect even in cases where the treatment lasted for many weeks. Some gastric disturbances were noticed at times, when very high doses were given. The results were as good as when prednisone or prednisolone are given alone. The effects were continuous; rheumatic symptoms regressed rapidly, biological tests tended toward normalization.

Cortisone in the Treatment of Some Liver Conditions. L. Andreoli. Riforma med. 70:708-712 (June 23) 1956 (In Italian) [Naples, Italy].

The author treated with cortisone five patients with various liver conditions: two had acute hepatitis, one had common cirrhosis, and two had posticteric cirrhosis. Three patients with acute hepatitis, two with common cirrhosis, and one with posticteric cirrhosis were kept as control cases and received the usual treatment without cortisone. Comparing the results obtained in the two groups, the author found that cortisone had a good general effect and a marked effect on the icterus. The regression of the icterus was speedy even in cases that could not have been cured with routine treatments. In three months' time the size of the spleen and of the liver decreased markedly. Patients did not receive any collateral treatment while they were being treated with cortisone. The use of cortisone seems particularly indicated for the treatment of acute hepatitis, especially in patients who can not be cured with common routine treatments. The next best results are obtained in patients with posticteric cirrhosis. By comparison, the effect of cortisone on common hepatitis does not seem to be pronounced. In all cases, however, the adrenal hormone succeeds in preventing progression of the condition

The Epidemiology of an Erythromycin Resistant Staphylococcus. A. F. MacCabe and J. C. Gould. Scottish M. J. 1: 223-226 (July) 1956 [Glasgow, Scotland].

The development of resistance to antibiotics is accepted by many as an inevitable outcome of their use, and so there is a tendency to anticipate and hope that some new antibiotic will be discovered in time to deal with the resistant flora left behind by the previous one. This attitude is extremely dangerous, and, in the case of erythromycin, the problem of development of resistance is very serious. In Edinburgh the use of erythromycin has been largely restricted to a few hospital centers, and the bacteriologists have discouraged its indiscriminate use. Three important maxims have been followed in the use of erythromycin: 1. It has been used in modest amounts and as an oral or parenteral preparation, almost entirely for short-term therapy. 2. it has never been used for the treatment of trivial infections. 3. It has been used with the cooperation of the bacteriologist. Despite these precautions a Micrococcus (Staphylococcus) pyogenes that was resistant to erythromycin was isolated from a third degree burn of the buttock in a 9-year-old boy (patient A), who had never before been in hospital and had never had any infection. Moreover, he had never at any time been treated with erythromycin.

The micrococcus isolated from the burn of patient A was found to be resistant to penicillin, streptomycin, aureomycin, and terramycin but sensitive to chloramphenicol, and on preliminary examination was found to be resistant to 50 mcg. per milliliter of erythromycin. No erythromycin was in use in this particular ward at this time, nor had been for the past six months; and none of the attendant staff had been treated with the antibiotic. The antibiotic sensitivity and bacteriophage susceptibility patterns of the micrococci isolated from the nose and wound of patient A were identical, and strains of the same phage pattern and antibiotic sensitivity were isolated from only one other source, namely patient B, who occupied the adjacent bed in the ward. The history of patient B revealed that he had spent several weeks in another hospital earlier in the year in a ward where erythromycin had been used, and it is likely that he acquired the erythromycin-resistant strain at that time. It was impossible to treat these patients in isolation, but great care was taken to prevent further cross infection. Patient A was treated by the systemic administration of chloramphenicol, and his wound healed rapidly without further complications. The authors emphasize the fact that in order to limit the spread of erythromycin-resistant strains patients being treated with this antibiotic should be nursed in isolation, and there should be continual vigilance to detect erythromycin-resistant variants in patients and contacts, so that the appropriate action can be taken.

RADIOLOGY

The Results of Radiotherapy of Bronchial Cancer. L. H. Garland and M. A. Sisson. Radiology 67:48-62 (July) 1956 [Syracuse N. Y.].

Eighty-one patients with bronchogenic carcinoma admitted to the San Francisco Hospital and 41 patients with bronchogenic carcinoma in private practice were treated by roentgen therapy alone. Most of the patients received about 3,000 r throughout the tumor and its known or presumed regional nodes in about four weeks. In a small number of apparently favorable cases the plan was to deliver a potentially curative dose of about 5,000 r in four or five weeks, but this was not often accomplished. The technical factors were orthovoltage (200 or 250 kv.), with filtration to give a half-value layer of from 1 to 2 mm. copper; target-skin distances of 50 to 70 cm.; and skin fields of from 10 by 10 cm. to 20 by 20 cm., often irregular in shape to conform to the primary tumor and the enlarged nodes. Multiple small fields were used for radical doses and two or four larger fields for palliative or moderate doses.

The average survival time after treatment in the 122 patients was 6.2 months, the range being from 1 to 60 months. This average survival time was about three months longer than the average in a series of untreated patients. Relief of symptoms for a period of weeks or months was obtained in approximately two-thirds of the treated patients, but marked improvement occurred in only about 20% of the patients. Results were slightly better in patients with anaplastic tumors than in those with squamous-cell growths. The response to radiotherapy, however, was not predictable on histological grounds; some of the well-differentiated squamous-cell lesions responded better than some of the anaplastic tumors. Reports of megavoltage and betatron therapy to date suggest that the results of orthovoltage therapy for bronchial cancer, with use of the technique employed by the authors, are of about the same order of effectiveness. These facts would justify making greater use of generally available orthovoltage roentgen therapy in the care and treatment of patients with inoperable bronchogenic carcinoma today. Radiotherapy in moderately heavy dosage (about 3,000 r tumor dose in four weeks or less) has a useful place in the palliative treatment of bronchogenic carcinoma. In heavy doses (about 5,000 r tumor dose in four or five weeks), radiotherapy is occasionally curative. Patients in poor general condition or with distant metastases should not be subjected to radical radiotherapy. Palliative radiotherapy, however, judiciously applied, may often be of aid in these patients.

Comparative Evaluation of Radioactive Colloidal Gold and Nitrogen Mustard in the Treatment of Serous Effusions of Neoplastic Origin. F. J. Bonte, J. P. Storaasli and A. S. Weisberger. Radiology 67:63-66 (July) 1956 [Syracuse, N. Y.].

Twenty-two patients with serous thoracic effusion from tumors originating in the breast or ovary or from other tumors and 38 patients with ascites of malignant origin were treated by intracavitary instillation of radioactive colloidal gold. Results of this method of treatment were compared with those in 30 patients with neoplastic effusion of the pleural cavity and of 10 patients with malignant ascites treated by instillation of methyl-bis (beta-chloroethyl)-amine (HN2), a nitrogen mustard. Twelve patients with peritoneal or pleural effusions from tumors originating in the breast or ovary or from other tumors were given combined therapy with radioactive colloidal gold and nitrogen mustard. Thirty-seven of the 60 patients who received radioactive colloidal gold therapy were improved and 23 were therapeutic failures. Twenty-five of the 40 patients who received nitrogen mustard therapy were improved and 15 were therapeutic failures. Nitrogen mustard directly instilled into malignant effusions thus appeared to be of the same order of effectiveness as radioactive colloidal gold. The use of nitrogen mustard has several advantages over radioactive gold. It is easier to administer, it is more generally available, it is less expensive to the patient, and it presents no irradiation hazards either to nursing personnel or to those administering the treatment. The satisfactory results obtained with nitrogen mustard in the management of serous effusions of neoplastic origin encouraged the authors to employ nitrogen mustard first and radioactive gold second as a method of attack. The number of patients who received combined therapy with radioactive colloidal gold and nitrogen mustard is too small to permit definite conclusions; it has not yet been proved that the combined form of treatment has any additional advantage. In certain cases one substance may be successful when the other has failed.

Diabetic Charcot Joints. J. G. Bolen. Radiology 67:95-98 (July) 1956 [Syracuse, N. Y.].

Two cases of neuropathic changes in the joints of the foot (Charcot joints) associated with diabetes mellitus are described in a 39-year-old woman and a 43-year-old woman. The right leg was amputated at a point 6 in. below the knee in the younger patient, and a midthigh amputation was performed in the older patient. The causation of neuropathic joint changes in the feet of patients with diabetes mellitus is unknown, but theories regarding the origin of the condition include diminution of blood supply, peripheral neuritis, and extension to bone from a soft-tissue infection. The process usually begins after several years of poorly regulated diabetes. Early signs and symptoms include relatively painless swelling of the tarsometatarsal region with gradual eversion of the foot. The disease progresses slowly to partial or complete necrosis of the tarsal bones and obliteration of their normal joint relationship as revealed by radiographic studies in the two women. No specific treatment of the joint lesions in diabetes is efficacious. A review of the literature revealed that the condition was apparently arrested by lumbar sympathectomy in two patients. Some benefit from immobilization of the foot and ankle by orthopedic appliances to prevent weight-bearing and further deformity was also reported. To obviate the extreme difficulty of regulating diabetes mellitus in the presence of a chronic infection and to relieve pain and deformity, the affected extremity is often amputated, as in the author's patients.

Splenoportography for the Diagnosis of Portal Hypertension. J. M. Falomir, M. Campuzano and B. Sepúlveda. A. M. A. Arch. Int. Med. 98:39-43 (July) 1956 [Chicago].

Percutaneous splenoportography according to Abeatici and Campi's technique was performed in 11 patients with portal hypertension associated with esophageal varices and splenomegaly. Thirty cubic centimeters of 70% iodopyracet (Diodrast) was injected by splenic puncture. No serious accidents were observed. The chief usefulness of the method lies in its ability to supply the following information: (1) confirmation of the existence of portal hypertension; (2) localization of the site of obstruction, thus helping to make possible a differential diagnosis between portal hypertension caused by intrahepatic obstruction (cirrhosis) and that caused by an extrahepatic block; and (3) demonstration of anomalies such as a fibrotic portal vein (which, in addition to being the cause of the hypertension, makes the vessel unfit for a portacaval anastomosis) or the formation of the splenic vein by two veins that go almost to the middle line, making it unfit for splenorenal anastomosis.

Hepatic Duct Carcinoma Seventeen Years After Injection of Thorium Dioxide. J. C. Roberts and K. E. Carlson. A. M. A. Arch. Path. 62:1-7 (July) 1956 [Chicago].

Thorotrast, a stabilized emulsion of thorium dioxide, has been widely used as a contrast medium for radiography. It is radioactive and is retained indefinitely in the reticuloendothelial system. Recent reports indicate that the combination of radioactivity and indefinite retention may lead to necrosis and fibrosis at injection sites, to hemopoietic disturbances, and to the formation of neoplasms. The authors present the history of a 45-year-old woman in whom carcinoma of the hepatic duct developed 17 years after intravascular injection of thorium dioxide into an extremity for demonstration of a peripheral vascular abnormality. Although no direct cause-and-effect relationship can be proved, thorium dioxide was extremely prominent in the portal lymph nodes and in the portal aspect of the liver. The presence of thorium dioxide was diagnosed before death by an abdominal roentgenogram and proved after death by spectrochemistry. Radioactivity was demonstrated by gamma-counting and autoradiographs. The estimate of the quantity of thorium dioxide retained, based on calculations of the amount found at autopsy in the liver, lymph nodes, and spleen, is in remarkable agreement with the usual dosage for peripheral vasculography.

Fatal Pulmonary Insufficiency Due to Radiation Effect upon the Lung. D. J. Stone, M. J. Schwartz and R. A. Green. Am. J. Med. 21:211-226 (Aug.) 1956 [New York].

Five men between the ages of 22 and 61 years, two with bronchial carcinoma and one each with metastatic testicular embryonal carcinoma involving a portion of the anterior segment of the right upper lobe and adjacent mediastinum, a large mediastinal mass caused by Hodgkin's disease, and mediastinal metastasis from seminoma, were given irradiation treatment. The first three patients received one irradiation course with a total depth dose of 4,100, 6,000, and 3,200 r respectively. Of the two remaining patients, one received three and the other five courses of irradiation therapy; the total depth doses administered to the first of these two patients were 4,477, 1,800, and 2,000 r, and those administered to the second patient were 2,700, 2,714, 3,135, 2,061, and 2,000 r. Radiation pneumonitis and fibrosis leading to severe pulmonary insufficiency occurred in all five patients. In the first and in the third patients the fatal syndrome occurred after 4,100 and 3,200 r respectively were given within two weeks, a relatively short period. The second patient was given the much larger dose of 6,000 r over a period of 40 days before pulmonary fibrosis occurred. One may, therefore, relate the individual development of pulmonary fibrosis to the volume of lung exposed, the total depth irradiation, and the rapidity with which this total depth irradiation is given. The occurence of cumulative effects of radiation is suggested by the observation that in the two patients who received multiple courses of irradiation therapy the previous courses were not associated with clinical manifestations, although pathological changes in the lung may have been produced, and that it was only after the multiple courses that the clinical picture of irradiation reaction developed. Correlated clinical, functional, and pathological findings indicated that impaired diffusion across the alveolar-capillary membrane played an important role in the functional abnormality in each patient. Steroid therapy with hydrocortisone, corticotropin (ACTH), prednisone, and prednisolone, utilized in four patients, failed to alter the course of the acute syndrome. The irradiation therapy given to the patients conformed to modern standard practice. This practice should now be reviewed in the light of the technical improvements that make possible delivery of more intensive irradiation to a more restricted area in depth in shorter periods, at the risk, however, of increasing irradiation fibrosis in a larger proportion of treated patients.

PHYSIOLOGY

The Pathogenesis of Sodium Retention in Congestive Heart Failure. A. C. Barger. Metabolism 5:480-489 (July) 1956 [New York].

The various stages in the progression of heart disease can be duplicated in the laboratory by the production in dogs of discrete, right-sided cardiac valvular lesions of increasing severity. These surgical operations result in alterations in cardiac function that can be graded from mild to severe and that are stable over periods of months. Recent observations in man and dog indicate that alterations in sodium metabolism occur very early in heart disease, even before a significant change in resting venous pressure. At such a stage of cardiac incompetence there is usually a fall in renal plasma flow and only occasionally a decrease in glomerular filtration rate. The findings in such patients are similar to those observed in normal persons with imposed circulatory stress and raise the question of the possible role of baroreceptors in the reflex regulation of sodium balance. Even with such minor degrees of cardiac incompetence, mild exercise further decreases the renal plasma flow, lowers the glomerular filtration rate, and is accompanied by a retention of salt and water.

As the clinical condition deteriorates and the resting venous pressure begins to rise, exercise produces an increasingly greater elevation of venous pressure. Such an acute elevation of venous pressure leads to sequestration of blood in the venous system and excessive filtration from the capillary bed. Since the lymphatics may, at this stage of the disease, be transporting fluid at a maximum rate, the increased filtration may not be accompanied by an increase in lymph return. With the elevation of pressure in the venous system during exercise, lymph return must be further impaired, resulting in a significant decrease in "effective circulating blood volume." Such fluid dislocation further enhances sodium retention. The glomerular filtration rate may still be normal, however, even when overt failure is present, with ascites and edema. Nevertheless, the retention of sodium introduced directly into the renal artery of dogs in failure is evidence for increased tubular reabsorption of sodium at this stage of the disease. It is important to the understanding of the pathogenesis of congestive heart failure to know whether the excessive secretion of aldosterone precedes the overt failure or is apparent only in the later stages of decompensation. With the progressive deterioration of the clinical condition of the patient and the development of anorexia and cachexia, profound alterations in renal hemodynamics ensue, further impairing the ability to excrete sodium and water Only with an analysis of the multiple factors that are altered in the natural progression of the disease can the relative importance of these various factors in the pathogenesis of sodium retention be determined.

A Manual Method of Artificial Respiration for the Simultaneous Resuscitation of Two Victims. A. L. Bennett, L. H Jodrey, J Christensen and M. M. Mehring. J. Appl. Physiol. 8:603-607 (May) 1956 [Washington, D. C.].

"How can one person most effectively give artificial respiration to two victims?" To answer this question the efficacy of the Holger-Nielsen method for simultaneous induction of respiration in two victims was compared with that of two standard single methods. When the Holger-Nielsen method is applied to two victims, they are placed close together in the prone position. Their adjacent arms are extended straight beyond their heads. The outer two arms are bent so that, with faces turned outward, each head may rest at the temple on the back of a hand. The operator kneels astride the two outstretched arms and close to the two heads He puts on pressure by placing a hand between the shoulder blades on each back while rocking forward on his knees. He then grasps the outer two elbows and pulls as he rocks backward. After the pull, the elbows are dropped and pressure is again applied to complete the cycle, which is repeated 12 times a minute Forty volunteers were tested for use as subjects. Not all subjects proved able to permit entirely passive respiration. Such subjects were eliminated in preliminary tests. A total pressure of 40 lb per subject was used. An audible time signal at 5-second intervals made it possible for the operator to maintain a uniform rate of 12 cpm for each method tested. Oxygen consumption of the operator was measured and his tidal exchange recorded by having him breathe in a closed system.

The results obtained on selected subjects were shown to be valid in terms of a comparison with tests made by others on unconscious subjects. The Holger-Nielsen method was found to be 96% more efficient than the Schafer method in terms of tidal volume exchanged, while it required 18% more effort in terms of maximum rate of oxygen consumption during work. The double Holger-Nielsen method, compared with the Schafer method in the same way, was 74% more efficient at a cost of 64% more work. The double method is so nearly equal to the single Holger-Nielsen method in its effect on tidal exchange that in case there were two operators available for the resuscitation of two victims there would be justification for the use of the double method to allow periodic relief of the operators and, more important, the freedom of one to keep airways open and to seek help.

BOOK REVIEWS

Progress in Neurobiology: I. Neurochemistry. Edited by Saul R. Korey, M.D., Professor of Neurology, Albert Einstein College of Medicine of Yeshiva University, New York, and John I. Nurnberger, M.D., Research Associate, Institute of Living, Hartford, Conn. With 23 contributors. Cloth. $6.75. Pp. 244, with 29 illustrations. Paul B. Hoeber, Inc. (medical book department of Harper & Brothers), 49 E. 33rd St., New York 16, 1956.

This work is the first of a series of three projected volumes on neurobiology, a relatively new field of study that is advancing with ever-increasing impetus and accumulating a great variety of facts at nearly all levels of instrumental observation. The aid of practically every modern scientific device or technique of biological investigation is being sought to elucidate the biochemical and biophysical processes of the brain. This book attempts to present as up-to-the-minute a review as possible of the many-sided investigations in neurochemistry, including current work in the laboratories of the various contributors. This adds a sense of immediacy and tentativeness that is so often lacking in review articles, which sometimes give a false impression of established fact. Another aim of the series is to bring together the work of these investigators in the hope that a pooling of their ideas will result in fruitful concepts based on the evolvement of speculations spawned by the processes of correlation and interrelationship. And it is precisely here that the weakest link in this field exists. The range of the papers is wide—from enzymatic thioltransacetylations to the structure of ribonucleic acid, from cerebral copper proteins to adaptive enzyme formation, and from chemical changes in the postnatal development of the rat brain to the neurochemistry of seizures.

The reader may feel at times that he is in the midst of a scientific free-for-all. Aside from the fact that this is generally the case when spadework is being done in a new field, it is in part also due to the inclusion of papers that might properly belong elsewhere. For example, a paper on the electron microscopic studies of the neuron more properly belongs in a volume on the ultramicroscopic morphology and cytochemistry of the nervous system. On the whole the reviews fulfill their aim in keeping the reader abreast of this expanding field, and, therefore, this book admirably serves a vital function. It is a sad commentary on the state of our specialization in the biological sciences to note that practically all the investigators are either biochemists or neurologists, with no representation by those whose daily work consists of the study of the mind. It is exactly this cleavage that precludes the formation of integrated concepts spanning from the chemical through the symbolic and behavioral spheres, which would provide for the selection of foci of investigation and experimental design that would give depth to the understanding of mental functioning. Despite the general recognition of this incongruity, the lines remain sharply drawn between those who explore the chemistry of the brain and those who study psychology.

The Nature of Viruses and the Origin of Life. By Hideo Moriyama. Cloth. $7. Pp. 454, with 40 illustrations. Shonan Hygiene Institute, Kamakura; sole agency: Igaku-Shoin Company, Ltd., 20, Hongo-6, Bunkyo-ku, Tokyo, Japan, 1955.

The author's purpose is to expound a theory by which all the life phenomena might be explained most simply. His theory is founded on the numerous facts that he claims to have discovered and has been advanced by the "researches carried out by other workers." He lists 654 references, including about 30 to his own publications, few of which are less than 15 years old. There is no indication in the book or on its jacket as to the author's academic qualifications or background. The book is arranged in five parts, with a long summary and a list of references at the end of each. Some of the chapter headings are The Key to Solving the Riddle of Life, The Infection of Denaturation, Propagation of Transnaturation in Protoplasm by Viruses, Eczema or Allergic Dermatitis, The Origin of Sexual Reproduction, The Theory of Memory, and The Faculty of Protein to Memorize Its Structure. The author's interests include entomology, blood clotting and hemolysis, virology, genetics, bacteriology, oncology, epidemiology, endocrinology, chemistry, physiology, and cortisone therapy. These indicate the range of subjects dealt with to solve the riddle of life.

Many of the author's opinions, observations, and statements are questionable or confusing. Examples of such are statements that sapotoxin injected intradermally gave rise to virus particles (p. 8), and similar particles were found in erythrocytes (p. 82) and crushed castor beans (p. 226); bacteriophage in chicken feces originates in the chicken itself (p. 129); and protein denaturation is generally infectious. He states that viruses and life in general originated in the primordial ocean ooze that contained globulin-like protein; this protein united with precipitated lipids to form elementary bodies and protoplasm endowed with assimilase. Evidently the author had spontaneous generation in mind. Many statements are eyebrow raisers: "Mankind seems to have begun to make a dash at the fate of extermination—because of rapidly developing orthogenesis" (p. 427). "The tubercle bacillus is an inheritable pattern of the gene in the majority of human beings" (p. 278). "Life may be nothing but the manifestation of the function of assimilase" (p. 286). The book shows how an author can review vast fields of science, select the matter he wants, add a few personal observations, and weave facts and notions into a hypothesis. There are numerous tables, well-drawn charts and diagrams, and a few unclear photomicrographs. At times, sentences must be reread because of numerous misspellings and minor lapses of English, for which the author apologizes in the preface.

Outline of Orthopaedics. By John Crawford Adams, M.D., F.R.C.S., Consultant Orthopaedic Surgeon, St. Mary's Hospital, London, England. Cloth. $7. Pp. 423, with 299 illustrations, Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2; E. & S. Livingstone, Ltd., 16 and 17 Teviot Pl., Edinburgh 1, Scotland, 1956.

This is one of several condensed textbooks on orthopedics published in the last two to three years; each new book seems to be a definite improvement on the previous one. This book is compact, and the descriptions of the various orthopedic disabilities, though brief, are adequate. Discussions of treatment are minimized. In a book of this type that is a good thing, because treatment may be so varied, so expensive, or so debatable that discussion of it would take up many pages. The author gives his views on treatment briefly, and, if the reader is interested, he may look up the details elsewhere. The arrangement of material is excellent, particularly the part on the descriptions of regions. The author takes up the cause, pathological changes, clinical features, course, prognosis, and treatment of each condition described. The roentgenographic reproductions are uniformly good, and the line drawings ably illustrate the various conditions dealt with. The size of the book makes it easy to handle, and the printing is large enough to be easily read. This book can be recommended to medical students, interns, and residents. It would also be an excellent book for the orthopedist to have on his desk, because the line drawings would help him to explain to patients or their parents the underlying condition of the ailment they have.

A Clinical, Pathological, and Genetic Study of Multiple Neurofibromatosis. By Frank W. Crowe, M.D., William J. Schull, Ph.D., and James V. Neel, M.D., Ph.D. Publication number 281, American Lecture Series, monograph in Bannerstone Division of American Lectures in Dermatology. Edited by Arthur C. Curtis, M.D., Chairman, Department of Dermatology and Syphilology, University of Michigan, Ann Arbor. This study was supported by Contract AT (11-1)-70 from United States Atomic Energy Commission. Cloth. $5. Pp. 181, with 15 illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 24-25 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, Canada, 1956.

This monograph on neurofibromatosis from the Hereditary Clinic of the Institute of Human Biology, University of Michigan, was written by a dermatologist in collaboration with two geneticists. It presents the conclusions reached by a study undertaken in an effort to develop a representative picture of the clinical and genetic aspects of a relatively rare disease with protean manifestations. The material on which the monograph is based consists of 227 patients seen at the University of Michigan Hospital during the years 1934 to 1950. For the purposes of this study the patients were interviewed by a trained field worker and a tentative pedigree was drawn up as a basis for planning physician contacts with other members of the family. Affected persons were given a complete cutaneous examination, and a detailed medical and personal history was obtained. Whenever feasible, the patients and as many members of the family as possible were brought to the hospital for more thorough study, including roentgenologic surveys, psychometric examinations, consultations with members of other departments, and diagnostic biopsies. The presentation of the case material is made in a clear and concise manner. The discussion of the cutaneous, osseous, and genetic aspects is especially good. There are a number of excellent illustrations of the pigmented cutaneous lesions, cutaneous tumors, and bone lesions. In addition, there are figures and tables that give a thorough analysis of the genetic factors. There is a brief but adequate bibliography and an index. The book is authoritative and clearly written and covers the subject well. It is worth the study of all physicians and should be in the library of every dermatologist, roentgenologist, neurologist, and geneticist.

Cerebral Palsy: Advances in Understanding and Care. By Viola E. Cardwell, R.N., P.T., M.A. Cloth. $5. Pp. 625, with 81 illustrations. Association for Aid of Crippled Children, 315 East 46th St., New York 17, 1956.

There has long been a need for an authoritative textbook in the field of cerebral palsy. Because so many specialties, including pediatrics, neurology, physical medicine, orthopedics, ophthalmology, and psychiatry, as well as such ancillary specialties as speech, psychology, and education, are involved, no single person is qualified to cover the entire subject. The present volume has successfully brought together many opinions, observations, and suggestions on the diagnosis of cerebral palsy and the management of children with the disease. In this respect, the book is up-to-date and comprehensive. It is divided into three sections: one dealing with the general aspects of the problem, particularly the diagnostic facets; one with the treatment and management of the individual patient; and one with the community aspects of the disease. The appendixes are valuable, giving the sources of supply of specialized equipment, lists of organizations interested in the problem, and an extensive bibliography. The text is illustrated with pictures clearly showing various types of equipment and their use. The author has maintained an objective viewpoint in compiling materials from various sources, but, because the book is a compilation, it falls short of the goal of evaluating the various types of treatment described. As might be expected, it contains conflicting statements, thus reflecting its varied sources. Although not suitable as a textbook, it is, nevertheless, a valuable source book, and it should be especially useful for educators, nurses, physical and occupational therapy students, and professional nonmedical workers in the field of cerebral palsy.

Biochemistry of the Eye. By Antoinette Pirie, M.A., Ph.D., and Ruth Van Heyningen, M.A., D.Phil. Cloth. $7. Pp. 323, with illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 24-25 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, Canada, 1956.

The purpose of the book is to encourage the use of the tissues of the eye in experimental biochemistry, so that the knowledge of the normal and abnormal eye may be enhanced. The volume is divided into 10 chapters, the first 4 of which are concerned with the lens, the tissue that has been more thoroughly investigated than any other tissue of the eye. Three of these four chapters discuss the composition of the lens, its metabolism, and the transport of substances into it; the other is on experimental and senile cataracts. Several chapters treat the composition and metabolism of the cornea, retina, aqueous humour and ciliary body, and vitreous humour and the chemical aspects of vision. A final chapter discusses the effects on the eye of nutritional deficiences. The book should be of interest to ophthalmologists and biochemists who have done work on the eye or who contemplate going into the field. This relatively small volume is not intended to be a complete treatise on the eye or even to include all that is known on the biochemical processes of the eye. It does include, however, most of the fruitful work that has been done on ocular biochemistry and indicates the large amount of work still to be done. The volume contains an index and a bibliography at the end of each chapter.

Gynecologic Cancer. By James A. Corscaden, Ph.B., M.D., Attending Gynecologist, Sloane Hospital for Women, New York. Second edition. Cloth. $10. Pp. 546, with 116 illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2, 1956.

This second edition is essentially a reference book written from the point of view of a clinician and stressing the author's personal conclusions. It presents well the American attitude toward the problems of pelvic cancer in women and reviews the English-language literature dealing with them. Cervical tumors and endometrial cancers are exhaustively discussed, but some of the rarer tumors, such as chorioepithelioma and vulvar tumors, are incompletely described. This is probably the best summary in the American literature of the clinical problems of gynecologic malignant disease, but it lacks an authoritative histological approach. In fact, the author deprecates pathologists in general and states that one must know his pathologist to interpret reports. The details of the problems that the pathologist must face are given scant attention. It is, however, primarily a clinician's report and as such carries the unquestioned authority of the author. The book is well printed on glossy paper and has good illustrations and an adequate index. The references to the literature at the end of each chapter are useful but are largely from English-language sources and refer mostly to clinical reports. This is an excellent book for the clinician, and its wide use should add much to the efficiency of care given to women with pelvic cancer.

Galen on Anatomical Procedures: De Anatomicis Administrationibus. Translation of surviving books with introduction and notes by Charles Singer. Publications of Wellcome Historical Medical Museum, new series, no. 7. Cloth. $8.75, 37s.6d. Pp. 289. Published for Wellcome Medical Museum by Oxford University Press, 114 Fifth Ave., New York 11; Amen House, Warwick Sq., London, E.C.4, England, 1956.

A classic in medical history is here made available in remarkably interesting form. It is a classic in the sense that it can be depended on to furnish instruction, pleasure, and occasional surprises to future generations as it has to past generations. It contains some vivid accounts of the successes and failures of surgeons between 129 and 198 A. D. It also contains details of fundamental experiments in the physiology of such structures as the phrenic nerves and the diaphragm as well as the results of innumerable dissections, especially of apes. An unusual feature of this edition is the set of illustrations by Kopel on the anatomy of the rhesus money; these facilitate the understanding of Galen's text. Except for his rather personal and belligerent manner, Galen sounds quite modern. His odd mixture of boastfulness and reticence suggests that the problems of anatomists and physiologists in his time were much like those of their modern counterparts. The notes and index are excellent. The book is recommended.

World Atlas of Epidemic Diseases: Second Part in 4 Issues: Second-Fourth Issues. Edited under sponsorship of Heidelberg Akademie der Wissenschaften, by Professor Dr. med. Ernst Rodenwaldt. Assistant scientific editor, Privatdozent Dr. med. habil. Helmut J. Jusatz. In collaboration with Prof. Dr. R. E. Bader, and others. [In German and in English.] Paper, loose-leaf. Various pagination, with 10 maps, 9 maps, 11 maps. Falk-Verlag, Burchardstrasse 8, Hamburg 1, Germany, 1954-1956.

The publication of this monumental work, started in 1954, has been completed. Part 1 and the first issue of part 2 (published in four issues) have already been reviewed in THE JOURNAL (May 9, 1953, page 197, and Feb. 19, 1955, page 690). The maps and text of part 2 were not issued in sequence, but, since they are perforated for inclusion in a loose-leaf binder and since the pages are numbered, they can now be assembled in the order in which they appear in the table of contents. Those who have the earlier issues should be pleased to be able to complete their collection. It is hoped that the loose-leaf format means that as certain maps become obsolete with improvements in methods of disease prevention they will be brought up-to-date and made available as replacements.

QUERIES AND MINOR NOTES

DOG BITES

To the Editor:—*What are the responsibilities of the physician, local authorities, and family in regard to dog bites when (1) the dog is a friendly neighbor's and (2) the dog is unknown and has disappeared? Is the physician obligated to give the rabies vaccine series if the dog is not found? If it was decided by the physician that the unknown dog was not rabid and/or the bite was only an abrasion and later the person died of rabies, is the physician liable? Is the mortality and morbidity from the vaccine significant enough to act as a deterrent when the dog cannot be found?*

William G. Thomas, M.D., Sycamore, Ill.

Answer.—Rabies control laws differ in the various states and cities. Whether the dog is owned by a friendly neighbor or by a stranger, the law should be adhered to strictly. Most rabies laws include the statement that it is unlawful for any person having knowledge that a person has been bitten by a dog to refuse to report such an occurrence promptly to the rabies inspector and/or local health authority. This obligation is equally binding on the physician, the family, and the local authorities. The physician must decide on the basis of the history and clinical findings, as well as his own judgment, whether to administer rabies vaccine. If the dog is not found and if the bite has penetrated the skin, the physician should administer antirabies vaccine unless there is some very unusual circumstance involved. A physician's liability for malpractice is very difficult to define, since there may be many extenuating circumstances in addition to the physician's own judgment of a case. Neurological complications after administration of antirabies vaccine occur in a ratio of from 1 to 2,000, to 1 to 7,000 (International Rabies Conference, Paris, 1927; Appelbaum and others: *J. A. M. A.* 151:188 [Jan. 17] 1953; Transcript of Proceedings, Oklahoma Academy of General Practice, Oklahoma City, Feb. 18, 1953, p. 34). Therefore the appearance of neurological complications is not sufficiently frequent to act as a deterrent in the administration of rabies vaccine.

POLLEN AND ROOM AIR CONDITIONERS

To the Editor:—*Is there any scientific evidence for the claims that a room air conditioner can effectively filtrate pollens?*

M.D., Massachusetts.

This inquiry was referred to two consultants, whose respective replies follow.—Ed.

Answer.—Many tests have been run with room air conditioners. Three general types are available, a room window filter, a combined filter with cooler, and the precipitator or the combined filter-precipitator type. All of them remove pollen from the air to a greater or lesser extent, the precipitator type being the most efficient. The question of effectiveness is relative. Patients with hay fever whose symptoms improve when exposed to half the normal amount of pollen will improve with the least efficient of the filters. Those who are extremely sensitive may respond only to the most efficient apparatus. The relief will also depend on the habits of the individual and on the amount of time spent in the conditioned room. Those who have pollen asthma do not have as good a response as those who have nasal symptoms only.

Answer.—Conventional room air conditioners, equipped with fibrous filters, will remove only the larger pollens from the air. Special cloth filters, or electronic precipitators, must be used to remove all but the smallest pollens for the treatment of pollen asthma. Millipore filters will remove all pollens, but require too much power to force the air through.

ASTHMA COMPLICATING MYOCARDIAL INFARCTION

To the Editor:—*A 67-year-old man had, as his chief complaint, severe dyspnea. He had been treated by another physician for asthma, which had its onset about six months ago. The treatment used is not known. The patient was having most difficulty in the expiratory phase of respiration and was coughing intermittently, with the production of thick greyish sputum; there were no specific complaints referable to the gastrointestinal, genitourinary, or nervous systems. He did complain of a peculiar sensation substernally. He was fairly well developed, fairly well nourished, and of small stature, and he appeared to be acutely ill. Pulse rate was 120 per minute, equal and regular. Blood pressure of the left arm, propped position, was 92/70 mm. Hg. Cyanosis of the lips was present. The neck veins were not distended in the propped position. There was a marked increase in the anterior-posterior diameter of the chest. Percussion and palpation were nondiagnostic. Auscultation revealed predominantly expiratory dry musical rales throughout, and it was felt that severe bronchospasm was present. There were no crepitant rales. Sinus tachycardia was present. No peripheral edema was present. An electrocardiogram showed an extensive myocardial infarction of the anterior wall. The diagnosis was (1) bronchial asthma, severe, intractable, and (2) myocardial infarction, acute. The asthma did not respond to bronchodilators, expectorants, sedation, and oxygen. Please answer the following questions: 1. Should corticotropin (ACTH) and the corticosteroids be used as therapy for the intractable asthma, or are these contraindicated in view of the extensive myocardial infarction? 2. Since it was felt that the patient would die of anoxia unless the bronchospasm were relieved, the therapy of the asthma was extremely important. If the steroids are contraindicated, what therapy should be used? 3. If steroids are used, should anticoagulants be used also as part of the treatment of the myocardial infarction, or should they be withheld because of the already altered clotting mechanism, as a result of the steroids?*

M.D., Illinois.

Answer.—In a patient whose myocardium is seriously damaged by infarction, severe diffuse airway obstruction (due to edema, secretions, or bronchospasm) may well be lethal, because of the resultant marked increase in the muscular work of breathing, hypoxia, and possible hypercapnia. Hypoxia not only may lead to an increase in the extent of the infarction but also may predispose to dangerous arrhythmias, such as ventricular tachycardia or ventricular fibrillation. The use of corticotropin or the corticosteroids is definitely indicated to relieve the diffuse airway obstruction, particularly if other therapy is found not to be immediately effective. However, these other measures should not be discontinued when corticotropin or corticosteroid therapy is initiated. Thus, antibiotics, bronchodilators, and sputum liquifiers should be administered by the appropriate routes. Oxygen therapy is essential in such a patient. However, if this patient has had chronic diffuse obstructive emphysema of long standing, with carbon dioxide retention, there is a danger of depression of respiration by the administration of high concentrations of oxygen, since the respiratory center in such a patient is relatively unresponsive to either increased partial pressure of carbon dioxide or increased hydrogen ion concentration in the arterial blood. Nevertheless, oxygen should still be given, but in lower concentrations, intermittently, well humidified, and while the patient is under constant observation by a physician. Control of the oxygen therapy will depend on its observed effect on the frequency and depth of respiration, the clinical appearance of the patient, and, whenever possible, blood gas determinations. Peptic ulcer (gastric or duodenal) occurs much more frequently in patients with chronic diffuse obstructive emphysema than in the general population. It may be present in the absence of symptoms. For this reason, the prescription of an ulcer regimen (diet and antacids) will be advisable if corticotropin or corticosteroids are used. Because of the increased incidence of peptic ulcer in these patients, the use of anticoagulants will perhaps be

---

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

associated with a slightly greater risk than in a patient without chronic obstructive emphysema. However, if the indication for their use is present, they may be given if daily prothrombin determinations are available. The selection of antibiotics and the control of the bronchopulmonary infection, which are especially important if corticotropin or corticosteroids are used, will depend on bacteriological studies of the sputum. Salt restriction and the administration of potassium will depend on the type of steroid employed and the duration of its administration.

SEBORRHEIC DERMATITIS

To the Editor:—*I frequently see cases of bilateral axillary dermatitis, usually negative for evidence of fungi. There is usually no other area of dermatitis on the body. Deodorants, of course, have been excluded, as well as soaps. I presume that the usual diagnosis is seborrheic dermatitis. At least 60 to 75% of these people are rather nervous. What is the usual treatment for this condition?* M.D., Alabama.

Answer.—The treatment must be appropriate to the diagnosis. The axillary spaces are not uncommon sites for seborrheic dermatitis, but usually other favored parts are involved first or concomitantly, such as scalp, retroauricular and nasolabial folds, eyebrows, and sternum. Other folds, too, may be involved, such as the inguinal and in the umbilicus. If none of these other parts is affected, then it might be well to consider other diagnoses. Dermatitis venenata from rubber dress shields, materials used by tailors in building up the armholes of coats, and toilet waters should be considered. Erythrasma is a fungous infection imparting a reddish appearance to the armpits. The causative organism, the Actinomyces minutissimus (Microsporon minutissimum), cannot be cultured and is difficult to demonstrate.

If the correct diagnosis is seborrheic dermatitis, then 3 to 5% sulfur and 2 to 3% salicylic acid in a water-washable base make a reliable remedy. In some cases antibiotic creams with bacitracin and neomycin are more effective. Monilial infections, so common in folds, may yield to nystatin ointment or lotion. A fresh effort should be made to uncover a cryptogenic cause of a possible dermatitis venenata and do away with it if found.

MULTIPLE-DOSE VIALS OF MEDICINES

To the Editor:—*How long should one attempt to use multiple-dose vials of medicines? We use Demerol and morphine rarely, and yet we have 25-or-30-cc. vials of these drugs, which were in stock before I came here. We also have large vials of procaine. These would last three or four years if we were to use them all. How should we dispose of narcotic preparations of this sort if it should be necessary?* M.D., Ohio.

Answer.—The chief objection to the use of large multiple-dose vials of various medicines is the possibility of contamination from repeated withdrawals of individual doses or from failure of the seals. For this reason, large vials are not desirable in a situation in which small doses are withdrawn infrequently. It is recommended that the large vials be disposed of and replaced with hypodermic tablets or with small single-dose ampuls. The morphine and Demerol solutions could be disposed of by shipping them to the federal district narcotic supervisor. For details of this procedure consult Article 196, Regulations no. 5, issued by the U. S. Treasury Department, Bureau of Narcotics. This procedure is not required in the case of procaine, which does not come under the federal narcotic law. The Ohio state narcotic law should also be consulted.

BOXING

To the Editor:—*In Queries and Minor Notes, in the June 23, 1956, issue of* The Journal, *page 770, the question is raised whether a list is available "of physical standards recommended for individuals who participate in boxing matches." The consultant answered, in effect, that the usual medical requirements are general in nature and that details are left to the examiner. He concedes that a person who has no vision in one eye should not be allowed to box because his ability to defend himself would be impaired and also because of the possibility of loss of vision in the remaining eye. I take a more radical view. Boshoff and I, in an article "Boxing Injuries of the Eyes"* (A. M. A. Arch. Ophth. *39:643-644 [Ma 1948) presented case histories of boxers previously healt who suffered tears in the iris, with hyphema, cyclodialysis traumatic choroiditis followed by detachment of the retina, choroidal tears near the fundus, extensive hemorrhages in th vitreous body, widespread macular changes, and rupture o the lamina elastica posterior (Descemet's membrane), resul ing in keratoconus and corneal scarring. Doggart (Impact of Boxing on Visual Apparatus, A. M. A. Arch Ophth 54:161 169 [Aug.] 1955) has corroborated these findings Non these injuries are accidental in the strict sense of the term They were deliberately produced, since blows to the face ar the prescribed means used in boxing. That these blows d not always succeed in causing damage to the eyes or, m frequently still, to the brain is irrelevant for the evaluation o the nature of these injuries. Recent neurological and electr encephalographic surveys have disproved the assertion th clinical and electroencephalographic abnormalities due to b ing are infrequent. Undoubtedly, the same statement hold good for injuries to the eyes. Thus, "the possibility of loss vision," which the consultant mentions as a reason to debar person from participating in boxing if he is blind in one ey must be considered a danger to everybody who exposes him self to the vicissitudes of a fight whether he has suffered previous eye injury or not. The fact that no list is availabl of medical standards recommended for participants in boxin cannot absolve physicians from their responsibility when the are called on to advise patients in connection with boxin The medical view must be that boxing is taboo, since it i the aim in this "sport" to assault the opponent and to disabl him by inflicting serious injury. It is this fact that distin guishes boxing from such activities as track and field sport tennis, swimming, games, weight-lifting, and gymnastics former British cabinet minister, Edith Summerskill, has give an excellent review of the problem in its medical, social, an ethical aspects in a book that has just come off the press (Th Ignoble Art, London, William Heinemann, Ltd., 1956)*

SENSITIVITY TO RUBBER GLOVES

To the Editor:—*In the June 30, 1956, issue of* The Journa *page 931, there is a query concerning sensitivity to rubb gloves. I have a similar allergy and wish to pass on som information that may possibly be of help. 1 Neopren gloves or any other nonallergic gloves, when autoclave along with other rubber or latex gloves or materials, wi gradually assume their allergic properties. These gloves mu be autoclaved separately. 2. Neoprene does seem to becom more flexible, and possibly thinner, after frequent autoclav ing. 3. The B. F. Goodrich Company, Akron, Ohio, puts ou "special purpose" nonallergic gloves that answer the allerg problem but are extremely thin and tear easily They las through one or two operations. Gloves should be autoclave separately in order to maintain their nonallergic properties*

INFECTIONS DUE TO MIMA ORGANISMS

To the Editor:—*In* The Journal, *March 31, 1956, page 118 in Queries and Minor Notes, a doctor from Connecticut ask whether the pathogenicity of Mima organisms has been lim ited to causing vaginitis and conjunctivitis. An article by Townsend, Hersey, and me in the May, 1954, issue of th* United States Armed Forces Medical Journal (5:673) o *this subject may be of some general interest as we reported two cases of infection with Mima polymorpha as a causative agent in epidemic cerebral meningitis (Waterhouse-Friderich sen syndrome), one with autopsy findings and one with recovery.*

Hearings Planned on U. S. Medical Education • •
National Library of Medicine Established • •
Porterfield Named Assistant to Burney • •
3,300 Mentally Handicapped Placed on Jobs • •

HEARINGS ON MEDICAL EDUCATION

The staff of the House Interstate and Foreign Commerce Committee is getting ready for a series of panel-type hearings on medical education problems. Tentatively set for December, the sessions will follow the style of the Salk vaccine hearings of last year and the general health hearings of the 83rd Congress. In these, men prominent in various fields appeared as panelists to discuss problems. Plans for the new hearings call for testimony from authorities in medical education, plus representatives of groups utilizing the services of doctors, such as the Defense Department, the Veterans Administration, private hospitals, mental institutions, and state and local health agencies.

Prior to adjournment, the committee authorized a fact-finding survey in anticipation of legislative action in the next Congress. The first step in this was requesting numerous organizations to submit data bearing on medical education. The next step is the projected panel sessions. Information from these two would serve as the basis for legislative proposals in the 85th Congress, which convenes Jan. 3.

The committee has indicated its interest in two major aspects of medical education: the financial needs of medical schools and the supply and demand for medical school applicants and physicians. In this connection, both political parties have pledged some action in medical education, and President Eisenhower has urged added funds for building more medical schools.

ARMED FORCES LIBRARY TRANSFERRED TO PUBLIC HEALTH SERVICE

The National Library of Medicine now is officially in existence. It was created by transfer of the Armed Forces Medical Library to the Public Health Service (Department of Health, Education, and Welfare), which will be responsible for development and operation of the new institution. Dr. E. H. Cushing, deputy assistant secretary of health and medical affairs in the Department of Defense, officially transferred the books and records to the PHS. Receiving the property at a ceremony at the Armed Forces Medical Library was Dr. L. T. Coggeshall, special assistant for health and medical affairs of HEW, who represented Secretary Folsom.

After the ceremony, Col. Frank B. Rogers took representatives of HEW and the PHS on a tour of the library building and facilities. Colonel Rogers, head of the military library, will be first director of the new National Library of Medicine. The military library was founded more than a century ago by the Army. Today it is one of the largest and most important medical libraries in the world, containing almost a million volumes that represent literature in all languages on medicine, dentistry, pharmacy, and allied sciences.

A board of regents will assist Colonel Rogers in administering the library. It will consist of 10 persons appointed by the President, with ex officio members including the surgeons general of the Public Health Service and the three armed services and the chief medical director of the Veterans Administration, the librarian of Congress, and the assistant director for biological and medical sciences of the National Science Foundation. At its last session Congress authorized the transfer, and also the construction of adequate facilities on a site to be selected by the board of regents.

NEW POSITION—ASSISTANT TO SURGEON GENERAL

Dr. John D. Porterfield, head of the Ohio department of mental hygiene and correction, has been named to the newly created post of assistant to the surgeon general of the U. S. Public Health Service. A career PHS officer, Dr. Porterfield has been assigned to the Ohio health department for the last nine years. Similarly, his superior, Surgeon General Burney, had been assigned to the Indiana health department as commissioner for a number of years prior to his recall to Washington two years ago.

In announcing the new post and Dr. Porterfield's appointment, Dr. Burney said Dr. Porterfield would "help us greatly in guiding the development of new programs while maintaining a balance of present programs to keep in step with the constantly changing situations and new developments in the health fields. His broad and varied experience in public health administration makes him a valuable addition to the Surgeon General's staff." While in the PHS Dr. Porterfield was stationed in San Francisco; Lexington, Ky.; Fort Worth, Texas; Chicago; and Puerto Rico. At the National Institutes of Health he had a part in the early development of the research grants program.

From the Washington Office of the American Medical Association.

MENTALLY HANDICAPPED PLACED ON JOBS

The U. S. Office of Vocational Education estimates that about 3,300 persons with mental handicaps were placed on jobs through joint federal-state rehabilitation efforts in the year ending last July 1. The total represents an increase of about 12% over the figure for the previous fiscal year. Placements included about 2,700 who had been mentally ill and 600 who are mentally retarded. They are among the 66,273 disabled who were restored to productive occupations through public rehabilitation during the period.

Many of those listed in the total, the office says, also received help from other public and private nonprofit groups operating rehabilitation projects financed in part from federal funds. Last year the OVR awarded $3,200,000 in support of 245 public and nonprofit rehabilitation projects, in addition to 30 million dollars granted for basic support of state rehabilitation agency work.

MANAGEMENT OF MASS CASUALTIES

The first course to be offered nurses on the medical management of mass casualties was conducted in late September by the Walter Reed Army Institute of Research, Washington, D. C., in association with the Catholic University of America. Attending the two-week session were Army Nurse Corps and reserve officers, Army Medical Specialist Corps officers, and civilian nursing leaders. It was under the direction of Major Harriet H. Werley, coordinator of nursing activities at the institute and consultant on atomic casualties. Among civilian leaders taking part in the program were Dr. Harold C. Lueth, Chairman of the Committee on Civil Defense of the American Medical Association and the Committee on Disaster Planning for the American Hospital Association. He talked on what the A. M. A. and AHA are doing to guide and assist the professions in preparing for disaster.

MEETING OF SOCIETY FOR CRIPPLED CHILDREN AND ADULTS

Total rehabilitation leading toward independence for the crippled will be emphasized at the 1956 annual convention of the National Society for Crippled Children and Adults to be held in Washington, D. C., in late October. Top authorities from both voluntary and governmental organizations concerned with the crippled will join in seminar discussions on the theme "Rehabilitation—Gateway to Freedom." A panel discussion, "Health, Education, and Welfare Speak—Partnership in Rehabilitation," will be under the chairmanship of Dr. Elmer Hess, immediate past-president of the American Medical Association. Participants in the panel will be Dr. Leroy E. Burney, surgeon general, Public Health Service; Dr. Martha Eliot, chief, U. S. Children's Bureau; Dr. Romaine Mackie, chief of services for exceptional children and youth; and Mary Switzer, director, U. S. Office of Vocational Rehabilitation.

PERSONNEL

Lieut. Col. Hall B. Jennings Jr. has been named as the new chief of the plastic surgery service at the Walter Reed Army Hospital. Previously he held a like position at the Brooke Army Hospital in Texas. . . . Brig. Gen. William L. Wilson has retired after 30 years of active service in the Army Medical Corps. He was commanding general of Madigan Army Hospital, Tacoma, Wash. . . . Commenting on the resignation of Bradshaw Mintener as Assistant Secretary of the Department of Health, Education, and Welfare, Secretary Folsom commended him particularly for his "sound advice" on Food and Drug Administration problems. He said Mr. Mintener had been "instrumental in laying a proper foundation for a greatly needed expansion" in FDA activities.

MISCELLANY

Irvin Stewart, president of West Virginia University, headed the United States delegation to the recent European Research Symposium in Vienna, Austria. The theme of the symposium, sponsored by the Organization for European Economic Cooperation, was scientific personnel and applied research. Dr. Stewart served as deputy director of the Office of Scientific Research and Development during World War II. . . . Investigation of the outbreak of typhoid among persons at a church convention in Missouri is continuing. Seventeen cases have been confirmed. A probable cause of the outbreak, according to U. S. Public Health Service, is contamination of a well by seepage from a toilet drainage system. . . . The Food and Drug Administration has seized four lots of drugs for adulteration or misbranding and one lot that had not been cleared for safety. Six hundred tons of food unfit for consumption were also seized.

Subacute Thyroiditis.—Cortisone produces immediate relief of the signs and symptoms of subacute thyroiditis but, as in the therapy of all other diseases so far reported, merely suppresses the manifestations of disease. In severe cases the side-effects and dangers of long-term therapy may outweigh the clinical benefit obtained. Since x-ray therapy continues to have a curative effect in a high percentage of cases without side-effects or relapses, it should be considered superior to cortisone alone. In severe cases, combined therapy with cortisone and x-ray is worthy of further trial. Cortisone should be used for its immediate effect if no contraindications exist, x-ray therapy being started simultaneously. In the cortisone-treated cases appearing in the literature, in spite of a majority of favorable reports, it was noted that the follow-up periods were often short, and numerous recurrences were seen.—Lawrence Taylor, M.D., Cortisone Versus X-Ray in the Treatment of Subacute Thyroiditis: A Report of Four Cases, *Annals of Internal Medicine*, June, 1956.

AGE, SEX, SERUM LIPIDS, AND CORONARY ATHEROSCLEROSIS

David Adlersberg, M.D., Louis E. Schaefer, M.D., Arthur G. Steinberg, Ph.D.
and
Chun-I Wang, M.D., New York

- *Chemical determinations of serum cholesterol and phospholipid values were made in 1,200 specimens of blood obtained from healthy males and females between the ages of 2 and 77 years. The sample represented a particular geographic group with certain sociological characteristics. In 38 men of the 28 to 32 year age group, the average serum cholesterol value was 243 mg. per 100 cc.; the corresponding figure for 50 women was 200. A similar difference was found in the serum phospholipid values, and both differences were statistically significant. The differences were reversed in the older age groups; in 45 men of the 53 to 57 year age group, the average serum cholesterol value was 240 mg. per 100 cc., while in 28 women the corresponding figure was 286. Both the cholesterol and the phospholipid values for the males remained constant through age 19, increased from age 20 through 33, and then remained constant to age 60; for females they remained practically constant through age 32, then increased sharply through age 58. The reversal of the difference between sexes suggests an explanation of the known preponderance of males among patients under 50 suffering from disease of the coronary arteries.*

There is increasing evidence that atherosclerosis is fundamentally a metabolic disorder, occurring in genetically predisposed individuals and apparently subject to many environmental influences. That there is an inborn error in the metabolism of lipids and lipoproteins, with resultant abnormal elevation of these fractions in the blood, is an important part of this concept. In a previous study[1] the incidence of idiopathic hypercholesteremia was estimated in the population of the Mount Sinai Hospital in New York City. Five hundred persons, 250 men and 250 women who were consecutive admissions to the medical wards, and 59 families of these individuals were studied. Of the 500 index patients (probands), 12% were found to have cholesterol levels that were abnormally high when judged by the standards of Keys and his associates.[2] The frequency of hypercholesteremia among the siblings of the hypercholesteremic probands was 36.2%, and among their children it was 34%. It could be assumed from this study that hypercholesteremia in the families of hypercholesteremic probands was determined by a dominant gene with incomplete penetrance, a conclusion in accord with that of other investigators.[3]

It was felt, however, that a study of a metabolic disorder of this type, occurring, as it may, in otherwise healthy persons, would be more valid if carried out on family groups representative of the general population rather than on families whose probands were hospitalized patients. Furthermore, since it has now been shown that lipid levels may vary with a number of factors, including ethnic origin, sex, age, diet, and perhaps occupation, data derived from one population group do not necessarily apply to another. Accordingly, individuals selected at random from a healthy group of industrial workers and their dependents of low-middle income in Staten Island, N. Y., were examined in order to establish cholesterol and phospholipid level norms for this population group. The data so accumulated will be used in the further investigation of the incidence and mode of genetic transmission of idiopathic hypercholesteremia. The study of the average lipid levels in various sex and age groups is the subject of this presentation.

The Present Study

Plan and Methods.—Approximately 1,200 apparently healthy males and females between the ages of 2 and 77 years were examined, and their serums were analyzed for total and esterified cholesterol and for phospholipids. About one-third of the specimens were obtained from children whose parents were also included in the study. In this sense, a factor of selection

Read before the Ninth Clinical Meeting of the American Medical Association, Boston, Nov. 30, 1955.

may be involved. Serum cholesterol levels were determined by the Sperry-Schönheimer method and serum phospholipid levels by Sperry's modification of the Fiske-Subarrow method.

Results.—Information relative to ethnic origin, color, and religion is given in table 1. The almost completely white population is otherwise moderately heterogeneous, with a distinct predominance of families of Italian and Irish origin and a heavy preponderance of Catholics. When the data concerning the surveyed population are broken down according to five-year age groups for each sex (table 2), it can be seen that, in the age groups 3-7, 8-12, and 53-57, the females have significantly higher cholesterol levels than the men, whereas in age groups 28-32, 33-37, and 38-42, the reverse holds true. In the other age brackets there is no significant difference between the sexes. The total serum cholesterol level of the males remained constant from age 2 through 19. From age 20 through 33 there was a significant increase of total cholesterol level, averaging 3.6 mg. per 100 cc. per year. Thereafter, until age 60, there was no further change. The total serum cholesterol level of the females did not change significantly from age 2 through 32, although there appeared to be a slight decrease from age 2 through 20. From age 33 through 58 a significant rate of increase of 3.2 mg. per 100 cc. per year occurred (table 3 and fig. 1).

* In mg./100 cc.

† The probability that these differences between males and females would arise by accidents of sampling is less than 1 in 10,000.

The changes in serum phospholipid levels with age were similar to the changes in serum cholesterol levels in the two sexes (table 4 and fig. 2). There were no significant differences between the sexes and between any age groups in the ratio of free to total cholesterol. The cholesterol-phospholipid ratio appeared to be a function of the change in the serum cholesterol level and was independent of age. For each increase in the serum cholesterol level of 1 mg. per 100 cc., there was a 0.71-mg. increase of phospholipid in the serum in the females and a 0.67-mg. increase in the males. In other words, as the serum cholesterol level increased, the ratio of cholesterol to phospholipid became greater. The differences between males and females in the changes of lipid levels with age are worthy of note. The period of marked increase of serum lipid levels, which occurs physiologically in both sexes, starts 13 years later in women than in men and lasts 12 years longer.

Comment

Observations on serum cholesterol levels in various population groups have been previously reported.[4] More recently, Keys and co-workers[2] studied 2,056 men of ages 17-78 in a middle-income group in Minnesota; 5,000 measurements were performed. McMahon and associates[5] performed 822 serum cholesterol determinations in 554 normal persons of ages 10-90.

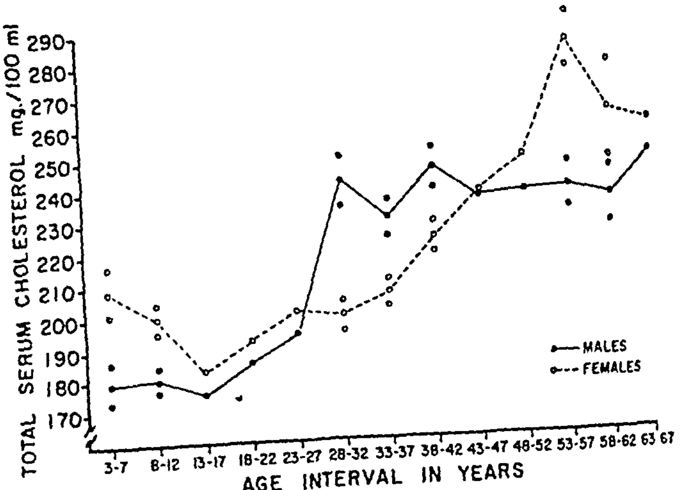

Fig. 1.—Total serum cholesterol levels by age in males and females.

Epstein and Boas[6] included cholesterol studies in their observations on prevalence of manifest atherosclerosis in a working population in New York that consisted mainly of Jews and Italians. Keys and co-workers[7] extended their cholesterol studies to population groups in England, Southern Italy (Naples), and Spain (Madrid). Oliver and Boyd[8] performed plasma cholesterol determinations in control groups of men and women aged 30 to 70+ in Scotland. Walker and Arvidsson[9] studied the changes with age in serum cholesterol levels in the South African Bantu.

// A survey of these data reveals marked differences in the cholesterol levels of the various population groups. There are also differences in alpha and beta lipoproteins and in the cholesterol-phospholipid ratio.[10] Whether these differences are genetically determined, as by sex or by genetically controlled metabolic factors,[11] or whether they are caused by such environmental influences as diet, climate, or occupation, cannot be decided at the present time. In certain populations, e. g., in the South African Bantu, the high incidence of malnutrition, liver disease (cirrhosis, hepatoma), and parasitic infestation may also affect the average serum lipid levels. Therefore, it must be concluded that each survey of serum lipid levels is valid for the specific population only and that comparisons between populations living under different geographical, cultural, economic, and social conditions cannot be made.

All available evidence indicates that coronary atherosclerosis is more common in males than in females in the younger age groups, that about 90% of persons under the age of 50 years who suffer from coronary artery disease are men, and that the first coronary artery occlusion occurs at an earlier average age in men than in women. However, the proportionate number of females suffering from coronary atherosclerosis increases after the menopause. Various theories have been advanced by other investigators in an attempt to explain these observations. Differences between males and females have been demonstrated in the concentration of macromolecules of the ultracentrifuged plasma.[12] The distribution of cholesterol in the alpha and beta lipoprotein fractions has been shown to differ for the two sexes.[13] The thickness of the intima of the coronary arteries in the male and female newborn infant was reported to be different. It may be postulated from the data derived from this study that the large annual increments in average serum lipid levels in men from age 20 through 33 play a part in producing the higher frequency of coronary artery disease in males in the younger decades and that increasing incidence of the disease in females in the older age groups may be related to the analogous changes occurring in women that start 13 years later and last 12 years longer than in men. The proof of this hypothesis will require a longitudinal study extending over a number of years. Careful observations on the frequency of coronary artery disease in males and females in close correlation with serum lipid and lipoprotein levels would be the goal of such an investigation.

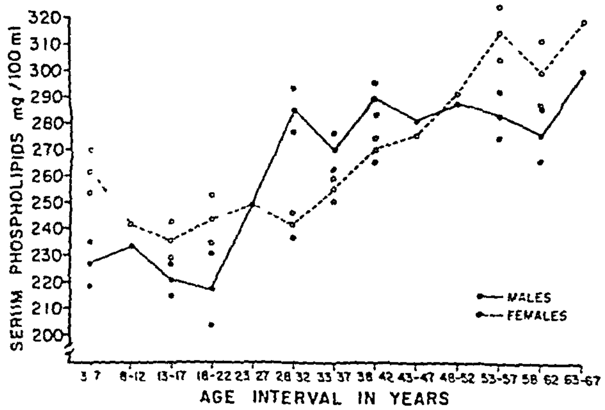

Fig 2.—Serum phospholipid levels by age in males and females.

The variations in serum cholesterol and phospholipid levels in normal males and females, reported here, provide further evidence that, while age has some effect on serum lipids, the aging process alone is not the determining factor in the development of coronary atherosclerosis. A substantial number of all cases of coronary artery disease and most coronary occlusions occurring in individuals under 50 are related not to age but to a complex pattern of metabolic, hereditary, environmental, and endocrinal factors, the precise proportions of which have not as yet been clearly defined.

Summary

Twelve hundred healthy males and females in Staten Island, N. Y., between the ages of 2 and 77 were examined and their serums analyzed for cholesterol and phospholipid, in order to establish average lipid levels for this population. These norms are being used in the investigation of the incidence and mode of transmission of idiopathic hypercholesteremia. The cholesterol and phospholipid levels for the males remain constant through age 19, increase from age 20 through 33, and then again remain constant to age 60. The levels for the females remain constant through age 32 and then increase sharply and continuously from age 33 through age 58. The differences in the age trends between the males and females may perhaps be related to the well-known preponderance of males with coronary artery disease in the younger decades and the proportionate increase of females with coronary atherosclerosis after the age of 50.

TREATMENT OF SPONTANEOUS PNEUMOTHORAX

Armand A. Lefemine, M.D., Edward T. O'Hara, M.D.
and
Joseph P. Lynch, M.D., Boston

• *In simple spontaneous pneumothorax, as distinguished from tension pneumothorax and hemopneumothorax, a variety of therapeutic approaches may be considered. Three different approaches were used in 42 nontuberculous patients with simple spontaneous pneumothorax. No underlying pulmonary disease was found in 32; in the remaining 10 the etiology ranged from asthma to sarcoma. In 15 of the cases, with partial collapse of the affected lung, rest was sufficient treatment, and the average time required for complete reexpansion of the lung was 12 days. Closed thoracotomy, consisting of the insertion of a catheter in the second intercostal space anteriorly and the maintenance of suction for two days, was done in 12 of the more severe cases; in those cases in which it was successful the average time required for reexpansion of the lung was 3½ days. It was much quicker and more effective than repeated aspiration.*

The treatment of spontaneous pneumothorax must be individualized to meet the specific needs of the occasion. The life-threatening tension pneumothorax and hemopneumothorax are special problems, and the need for aspiration and closed thoracotomy is quite clear. It is in the more commonly encountered situation of the simple spontaneous pneumothorax, regardless of etiology, that a variety of therapeutic approaches may be considered. The classic approach to spontaneous pneumothorax, whether partial or complete, is that of rest with limited activity, augmented when necessary by aspiration by needle. The results of this treatment, which have been reported extensively, can hardly be improved on in terms of recovery. In more recent times increasing emphasis has been placed upon closed thoracotomy as a routine measure in the initial phase of the condition, rather than as a late tool for the more unresponsive cases. The advantage of early closed thoracotomy lies in the shortened interval needed for complete expansion of the lung and for convalescence. In addition, the possibility of chronic pneumothorax with subsequent decortication and pleural effusion, as well as of empyema due to prolonged collapse, is obviated. Certain theoretical disadvantages of this procedure must be considered. One is the possibility of infection; the other is the possibility of hemothorax.

Previous Studies

The general mode of therapy in most of the reported series has consisted of a period of bed rest and limited activity, with aspiration used infrequently and only for the relief of symptoms in those with a large and complete pneumothorax. Rottenberg and Golden[1] found that only 9 of 97 patients required thoracentesis. They found the time for reexpansion to average 4 weeks and to vary from six days to 12 weeks. Hyde and Hyde[2] found that the period required for reexpansion without the use of a catheter was an average of seven weeks. This represents an investment of considerable money as well as time. Hughes and Lowry[3] found that only 4 of 37 patients required more than 24 hours of decompression by catheter for reexpansion. Shefts and others[4] found that, in 33 of 37 patients treated primarily with decompression by catheter, reexpansion took place within a few minutes.

Present Study

We have treated 42 patients with spontaneous pneumothorax at the Boston Veterans Administration hospital from the time of its opening in 1952 to 1955.

From the Department of Surgery, Veterans Administration Hospital.

Read before the Ninth Clinical Meeting of the American Medical Association, Boston, Dec. 1, 1955.

We were particularly interested in comparing the various modes of therapy used, namely, rest with limited activity, aspiration, and closed thoracotomy, from the point of view of relative safety, *duration of* pneumothorax, and required time for convalescence. In our series the numbers of cases treated by rest with limited activity, aspiration, and closed thoracotomy were approximately equal. Fifteen patients of the total of 42 were treated by rest alone. Aspiration and closed thoracotomy were employed in 12 patients each; 3 patients who had been treated with drainage by catheter required open thoracotomy because of persistent leak.

Table 1.—*Degree of Collapse in Forty-Two Patients with Pneumothorax, by Method of Treatment*

	Rest	Aspiration	Thoracotomy
No. of patients	15	12	15*
Complete collapse	0	4(33%)	11(73%)
Partial collapse, 30% or greater	5(33%)	8(66%)	4(27%)
Partial collapse, less than 30%	10	...	...

*Three were open thoracotomy, while 12 were closed

The technique used in closed thoracotomy included the standard insertion of a no. 16 soft rubber catheter in the second intercostal space anteriorly with the patient under local procaine anesthesia. This catheter was connected to a two-bottle suction system operated with a Stedman pump. Suction was maintained at 10 cm. H_2O for two days. X-rays were taken daily in most cases. Table 1 shows the breakdown in the three groups as to complete or partial collapse. It is important to note that the amount of collapse in those treated by rest and in those treated by aspiration was much less than in those treated by closed thoracotomy. Only one-third of the patients treated by rest and limited activity had collapses greater than 30%; none had complete collapse. Of those on whom aspiration was performed, only one-third had complete collapse, whereas the majority of patients in the group treated by closed thoracotomy had complete collapse. This is important in evaluating the results.

The series included all cases of spontaneous pneumothorax, irrespective of etiology. The patients' ages varied from 17 to 71 years, with an average age of 30 years. Underlying pulmonary disease was found in 10, or 24%, and included emphysema, asthma, bronchitis, bronchiectasis, granulomatous disease of the lungs, and sarcoma. All those with chronic pulmonary disease had had partial collapse. The two patients of this group with complete collapse of the lung had metastatic sarcoma. None in this series had tuberculosis.

Table 2.—*Days Required for Full Reexpansion in Forty-Two Patients with Pneumothorax, by Method of Treatment*

	Rest	Aspiration	Closed Thoracotomy*
Days, range	3-31	6-39	1-9
Av.	12.2+	15.1	3.5
Hospital days, range	4-31	11-22	6-18
Av.	14.6	15.4	10

*Six patients received conservative treatment for an average of 3.5 days prior to closed thoracotomy.

The etiology of simple spontaneous pneumothorax has been commented upon extensively. Congenital vesicles and localized atelectasis with formation of blebs have been well demonstrated as etiological conditions by the studies of Hayashi, Kjaergaard, and others.[5] Other factors such as exertion and chronic pulmonary disease with bronchospasm and infection, when superimposed on the formation of blebs, must be considered as contributory causes.[6] Exertion was found associated with the onset of symptoms in only 6 of the 42 patients. The symptoms usually consist of a sudden sharp pain in the upper anterior chest on the side affected and dyspnea. Dyspnea alone was noted as the initial symptom in two instances. The dyspnea and pleuritic pain tended to subside and, in some, to disappear in two to three days. Cough was a symptom in two. Hemoptysis and cyanosis were not observed.

Diagnosis was made by x-ray. The x-rays of all patients were reviewed, and the extent of collapse was estimated in terms of percentage. Figure 1 illustrates a typical x-ray of a patient with complete collapse. Recurrent pneumothorax has been experienced by a small though significant percentage of all groups studied. Seven patients, or 17% of this group, had had prior proved episodes. Two of these had had multiple recurrences; one had asthma in addition, and the other, who had had recurrent partial bilateral pneumothorax five times over the course of four months, had a granulomatous disease of the lungs, with extensive fibrosis and formation of blebs (fig. 2).

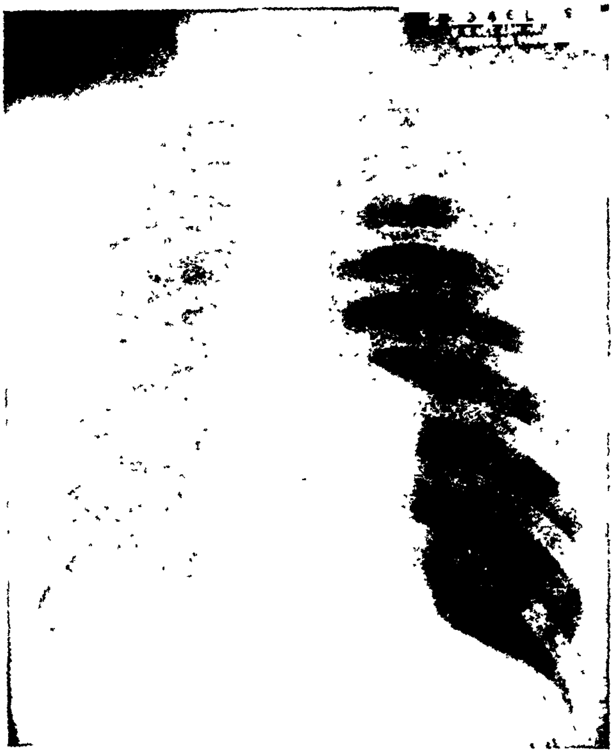

Fig. 1.—X-ray illustrating typical case of complete collapse.

In approaching the problem of therapy, it is well to remember that the pneumothorax may well have been present for some time; the duration of symptoms in this series varied from a few hours to six weeks. Only 25 patients, or 60%, entered the hospital within 24 hours of the onset of symptoms. Other aspects to consider are the extent of the collapse and the magnitude of the symptoms. Of the 42 patients seen, 17, or 40%, had complete collapse. Of the 25 (60%) with partial collapse, 17 had collapses of more than 30%. Thus 34, or 80%, of the series had pneumothorax with greater than 30% collapse.

Table 2 shows the time required for complete reexpansion of the lung and the total hospitalization for each method of treatment. The results in those treated by rest with limited activity and by rest plus aspiration were approximately the same. Thus, those treated by rest alone required an average of a little over 12 days for full expansion. This can be considered a minimal figure because of the lack of follow-up on some or because of a prolonged interval before follow-up x-rays were obtained. Those treated by rest plus aspiration required an average of about 15 days for complete expansion. Aspirations were not performed more than twice on any patient in this group. The range of time for full expansion in these groups was from 3 to 31 days when treatment was rest alone and 6 to 39 days when aspiration was also given. On the other hand, those treated by closed thoracotomy showed complete expansion of the lung on an average of three and one-half days from the institution of suction. The range was from one to nine days. This does not include the three patients who required open thoracotomy. The average length of hospitalization was 10 days, but this is due to the delay in instituting suction in 6 of the cases.

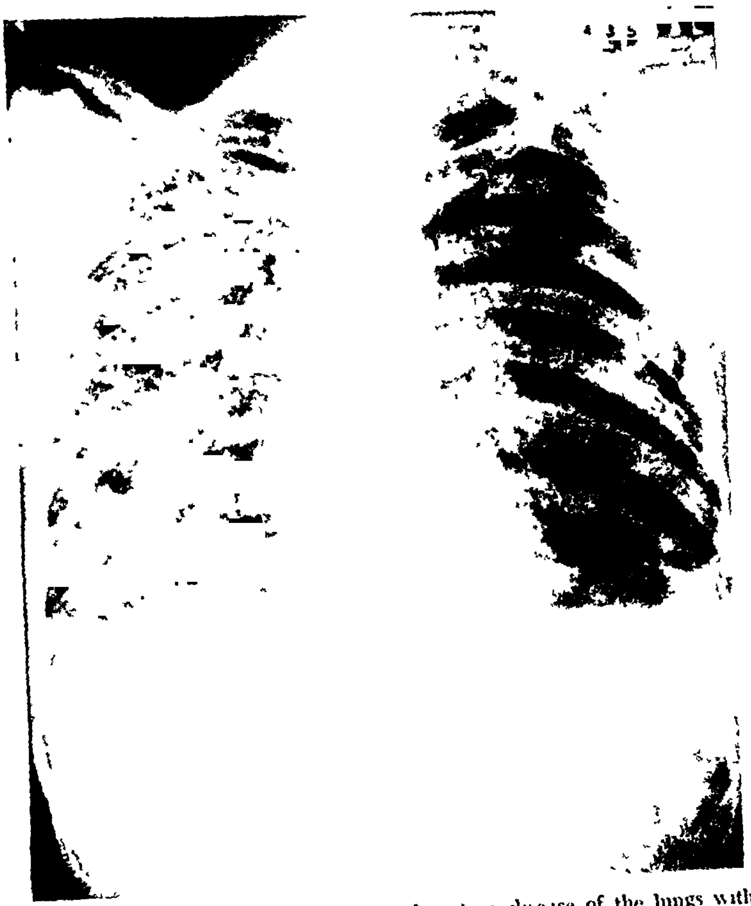

Fig. 2.—X-ray of patient with granulomatous disease of the lungs with extensive fibrosis and blebs who had recurrent bilateral lung collapse.

One complication was encountered in this group. The patient required a closed thoracotomy for a persistent leak after receiving expectant treatment and two aspirations over a period of nine days. After this procedure he developed hemothorax and empyema in addition to the persistent leak that at this time required open thoracotomy. Drainage of a recurrent localized empyema one and one-half years later resulted in complete recovery. This complication was due presumably to an error in technique.

General Approach

The significant reduction in time required for complete expansion of the lung and particularly for convalescence in a group of patients that is predominantly young and active led us to formulate the following general approach to spontaneous pneumothorax. If the patient is asymptomatic and the collapse is less than 30%, a conservative approach is indicated. If the collapse is greater than 30% or if the patient is symptomatic, aspiration to 80% expansion using a pneumothorax machine or syringe is indicated. A repeat aspiration is performed within 24 hours if necessary. If the pressure remains positive despite the withdrawal of 2 liters of air, it is a clear indication of persistent leak, and closed thoracotomy should be performed. If the expansion is not maintained despite a repeated aspiration, closed thoracotomy with suction is instituted and usually maintained for two days. This is followed by test clamping of the tube daily until expansion is maintained. The need for closed thoracotomy can be determined in 24 hours. If the leak persists despite closed thoracotomy with suction for five to seven days, open thoracotomy is performed.

The adjunctive use of thoracoscopy and injection of a sclerosing solution of glucose or the insufflation of talc have been discussed by Shefts and others[6] and by Marrangoni and others.[7] Thoracoscopy per se has no diagnostic advantages over the taking of x-rays in this condition. The use of a 50% glucose solution has been generally discarded because of the severe pain that accompanies its use and the difficulty in controlling application to a site. Insufflation of talc is advocated by some on the basis that it prevents recurrences. It, too, has the disadvantage that it is difficult to place the talc at the desired site and frequently the sclerosing reaction involves other surfaces, which is undesirable. To date we have experienced no recurrences in patients treated by simple closed thoracotomy, although the follow-up period is short. We do not believe that any of the adjunctive measures, such as thoracoscopy with the injection of a sclerosing agent, are indicated in the usual case of spontaneous pneumothorax. There is a place for these methods in the treatment of patients with repeated episodes of pneumothorax.

Summary and Conclusions

Forty-two patients with spontaneous pneumothorax were treated by rest with limited activity, aspiration, and closed thoracotomy. Closed thoracotomy required an average of three and one-half days for complete expansion of the lung compared to an average of approximately 12 days by rest and 15 days by aspiration. A therapeutic approach utilizing all the advantages of each method and preventing the prolonged convalescence of rest and aspiration was followed. The purpose of our approach was to employ the advantages of each method of therapy and to determine a clear indication for the need of closed thoracotomy rather than to use it routinely in all. Although rest is relatively the safest in terms of infection, it carries with it the threat of chronic pneumothorax with subsequent decortication as well as prolonged convalescence. Repeated aspirations have no advantage over a carefully done closed thoracotomy and lack the effectiveness of the latter procedure in persistent leaks and the rapidity of expansion obtained by closed thoracotomy.

Addendum

Since the time of writing of this paper, we have encountered two cases of spontaneous pneumothorax with active pulmonary tuberculosis.

TRANSTRACHEAL RESUSCITATION

Jay J. Jacoby, M.D., William Hamelberg, M.D., Carolyn H. Ziegler, M.D., Frederick A. Flory, M.D.
and
John R. Jones, M.D., Columbus, Ohio

• *Operative medications and the increased degree of muscular relaxation now requested by surgeons, especially where there is some predisposing factor to respiratory obstruction, all increase the responsibilities of the anesthetist to be aware of all methods to assist the patient's respiration while under anesthesia. When, after respiratory obstruction, all commonly applied methods of providing a clear airway have not been successful, or are unable to be accomplished, the insertion of an oxygen-carrying needle into the tracheal lumen may prevent a respiratory death. Oxygen saturation of the arterial blood, decreased to the point of cyanosis, may be reversed to normal or above within minutes after application of this technique and can be maintained for 30 minutes or more until the obstruction is alleviated. This is for emergency treatment only.*

A large proportion of operating room deaths may be attributed to respiratory difficulty. The majority of these deaths probably are preventable. Depression and paralysis of respiration are encountered more frequently in anesthetized patients now than in the past, because of the nature of the drugs now commonly used. Thus respiratory obstruction is more important now than it was in the past because the patients' efforts to breathe are not as forceful. An additional consideration is the fact that in the past the degree of muscular relaxation requested by surgeons was not as great as it is today. Depression, obstruction, and paralysis of respiration, which frequently occur, require that the anesthetist be adept in assisting the respiration of anesthetized patients.

Artificial respiration or assisted respiration, attempted in the presence of respiratory obstruction, is of little or no value. Providing a clear airway is usually a relatively simple procedure and can be accomplished by proper positioning of the head, support of the mandible, traction on the tongue, or by the insertion of an oral or nasal airway. When respiratory obstruction occurs and cannot be overcome by these simple techniques, endotracheal intubation and tracheotomy offer a more certain means of providing a clear airway. In some instances the insertion of an endotracheal tube may be technically impossible, because of the anatomic structure of the patient or the inadequate skill of the anesthetist or because equipment for intubation is not available. Such a situation should not, but does, arise. If there is severe obstruction, and intubation is not possible at the moment, the alternate treatment is tracheotomy.

Unfortunately, too many anesthetists are reluctant to recommend tracheotomy, and too many surgeons are reluctant to perform this simple operation; thus, the procedure may be delayed until it is too late to be of value. The reason for the anesthetist's delay in recommending a tracheotomy is his hope that he will soon be able to accomplish the intubation. The reason for the delay on the part of the surgeon may be his lack of familiarity with the procedure or his unwillingness to do an unscheduled operation, with the need to explain later to the patient and his family that a therapeutic misadventure had occurred. A simplified and rapid method for the performance of a tracheotomy has recently been proposed, but special equipment is required.[1]

Since the provision of oxygen at a time of need is of critical importance, a preliminary investigation with animals was undertaken to determine whether any

Read before the Section on Anesthesiology at the 105th Annual Meeting of the American Medical Association, Chicago, June 12, 1956.

other simple method could be devised to provide oxygen. The percutaneous insertion of a needle into the lumen of the trachea is a simple procedure. Such a needle could be used for the insufflation of oxygen. It was found that, in animals in which respiration was stopped by use of either barbiturates or muscle relaxants, anoxia could be prevented for rather prolonged periods by the insufflation of oxygen through a transtracheal needle or cannula.[2]

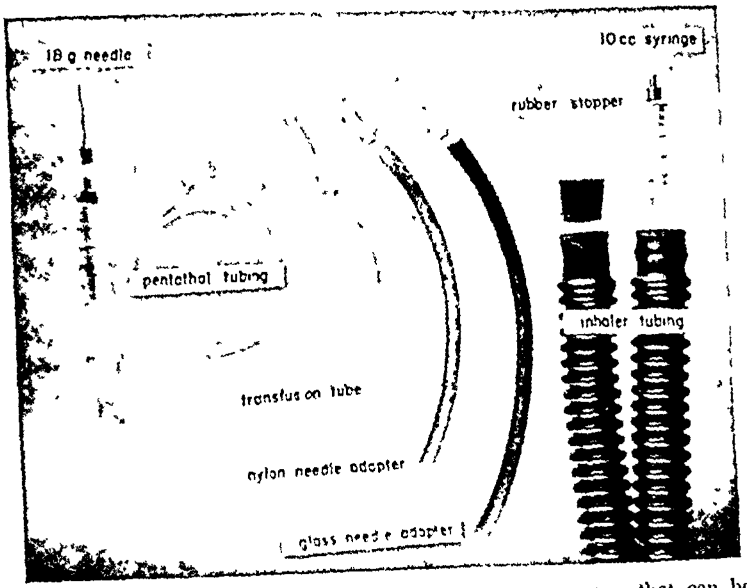

Fig. 1.—Materials commonly available in operating rooms that can be used in transtracheal resuscitation.

Shortly after the publication of that work, communications were received from a number of individuals stating that transtracheal resuscitation had been used successfully for patients with respiratory difficulty. Indeed, the technique was used successfully by members of the surgical house staff in the emergency rooms and wards of our hospital. It was decided, therefore, that a clinical investigation should be undertaken to determine objectively the values and limitations of the procedure in human patients. To be of real value and to make it readily available to all, the method should require no special equipment. For this reason, the techniques of the experiments with animals were modified, and an effort was made to utilize only materials commonly available in all operating rooms.

Technique for Transtracheal Resuscitation

The materials necessary for transtracheal resuscitation consist of an 18-gauge (or larger) needle, a 10-cc. syringe, a source of oxygen, and an adapter to attach the oxygen supply to the needle. The connection between the transtracheal needle and the oxygen tube may be made with a glass needle adapter, with the tapered end of a transfusion or infusion set, or with a small plastic "Pentothal tube" commonly used by anesthesiologists. If an ordinary anesthetic machine is used as the source of oxygen, the corrugated inhaler tubing of the gas machine can be adapted by the insertion of the barrel of a 10-cc. syringe into its end. The corrugated tubing may also be adapted by the use of a one-hole rubber stopper, to which tubing of a suitable size is attached (fig. 1).

The insertion of the transtracheal needle is accomplished simply and rapidly. The patient's neck is extended. The location for the needle insertion may be the cricothyroid membrane, as is ordinarily recommended for transtracheal injection of cocaine, or the first 2 or 3 cm. of trachea below the larynx. The trachea is steadied between the index finger and thumb of the one hand; the needle, attached to an empty syringe, is thrust through the skin at the midline, in a posterior and inferior direction. Traction is made on the plunger of the syringe. When the needle enters the trachea, the operator obtains a sensation of release of resistance. At the same time, air is aspirated freely into the syringe. The plunger of the syringe is then moved up and down several times to be certain that air moves without resistance in both directions. The syringe is detached, and the oxygen supply is then connected to the needle; oxygen is administered at 4 or 5 liters per minute (fig. 2).

Procedure and Results

Five patients who had malignancy in the upper respiratory passages and were scheduled for surgical procedures under general anesthesia were selected for transtracheal resuscitation. Except for their local lesions, these patients were in good physical condition. On a preliminary visit by the anesthesiologist, it was determined that respiratory obstruction probably would occur immediately after the induction of general anesthesia. Because of the size and location of the tumor mass, in ordinary circumstances a tracheotomy under local anesthesia would have been performed on these patients prior to the induction of general anesthesia or an endotracheal tube would have been inserted under local anesthesia. It was decided to proceed with general anesthesia without the prior performance of a tracheotomy. The surgeons cooperated in this investigation, standing by in the operating room prepared to perform a tracheotomy if it should be necessary.

The patients were prepared for operation in the usual way by the administration of meperidine (Demerol) hydrochoride and atropine in moderate doses. After a patient was placed upon the operating table, blood pressure, pulse, and respiration rate were recorded at frequent intervals, both before and during the procedure. A reliable calibrated oximeter was attached for continuous readings of oxygen saturation of the arterial blood. Its accuracy was verified by analysis of arterial blood by the Van Slyke method. A cardioscope was attached for continuous observation of the electrocardiograph. An infusion was begun, and general anesthesia was induced by the intermittent administration of thiopental sodium in small amounts (50 mg.).

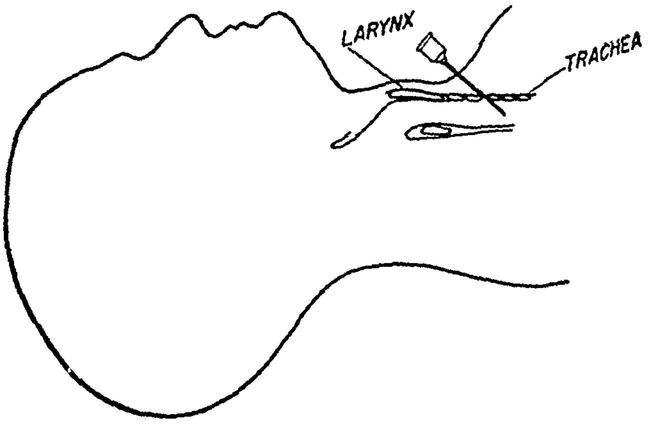

Fig. 2.—Placement of the needle for transtracheal resuscitation.

Prior to induction of anesthesia, these patients experienced respiratory difficulty because of the size and location of the tumor mass. As expected, in each patient complete respiratory obstruction occurred as soon as unconsciousness developed. Within one minute the level of oxygen saturation of the arterial blood diminished; within three minutes it fell markedly, and the patient became noticeably cyanotic. The transtracheal needle was then inserted, and administration of oxygen was begun at a rate of 4 liters per minute. In 30 seconds, the oximeter indicated a reversal in the progress of anoxia. The oxygen saturation level returned to normal or above within two minutes after the transtracheal administration of oxygen was begun. Cyanosis disappeared, and a satisfactory color of the skin and mucous membranes was noted.

In each of these instances the patient was attempting to breathe but was unable to do so because of the mechanical obstruction by tumor tissue. Retraction of the intercostal spaces and of the soft tissues of the neck was obvious. When the flow of oxygen through the transtracheal needle was begun, the patient's efforts to breathe continued. No outside air entered the patient's trachea during the inspiratory phase. During exhalation, however, the release of gas was readily noticeable to the observer—both by sound and by feeling the gas blow against his hand.

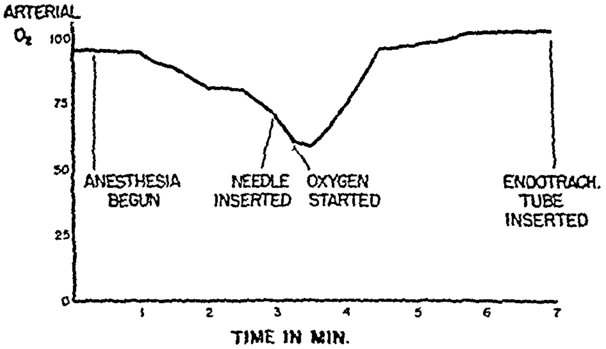

Fig. 3.—The effect of transtracheal administration of oxygen in counteracting rapidly progressive hypoxia due to respiratory obstruction.

Although transtracheal resuscitation was designed as an emergency interim procedure, the patients seemed to do so well with it that it was continued in some during the surgical procedures. Under normal circumstances, the technique would be used only until the respiratory difficulty was properly cared for by qualified individuals, either by tracheotomy or by endotracheal intubation. Blood pressure, pulse rate, skin color, and oxygen saturation level were observed at intervals of one to two minutes. In spite of the fact that total obstruction of inspiration was present, these patients gave no evidence of anoxia and the only evidence of carbon dioxide retention was a slight increase in blood pressure and pulse rate during the procedures.

Before transtracheal resuscitation was begun, the lowest levels of oxygen saturation of arterial blood reached were 85%, 76%, 75%, 59%, and 45%. Three minutes after transtracheal administration of oxygen was begun, the levels of saturation were 95%, 97%, 100%, 101%, and 102%, and they remained high throughout the procedures. The durations of transtracheal administration of oxygen in these patients were 5, 19, 34, and 42 minutes; for one patient it was 13 minutes with complete obstruction and 66 minutes with partial obstruction. The procedures were terminated when the obstructions were relieved, by tracheal intubation, tracheotomy, or allowing the patient to awaken.

Comment

During transtracheal resuscitation, the elimination of carbon dioxide is much more of a problem than oxygenation. Oxygen reaches the alveoli both by means of the mechanical blowing effect and by diffusion respiration.[3] However, carbon dioxide is less effectively removed by being mechanically carried out with the excess oxygen. Although blood levels of oxygen are well maintained, carbon dioxide levels rise.[2] The removal of carbon dioxide could be improved by alternately filling and emptying the lungs, using either intermittent pressure on the patient's chest or intermittent insufflation of oxygen. The former method is the more practical, since intermittent administration of oxygen at small flow rates would be inadequate and it is not possible greatly to increase the flow of oxygen because of the resistance of the small-bore 18-gauge needle. If a larger caliber needle were used, greater amounts of oxygen could be administered, and it would then be possible to place a Y-tube in the oxygen delivery system and alternately occlude and release the open end of the Y-tube.

In this group, the removal of carbon dioxide was aided by the fact that the patients were attempting to breathe. Although, during inhalation, no air entered the lungs, exhalation resulted in the discharge of the excess oxygen and accumulated carbon dioxide through the patient's mouth. When the technique was first tried, there was some concern about the possibility that the oxygen administered through the transtracheal needle might build up considerable pressure because of inability to find a route of egress. This could introduce the hazard of overdistention and damage of the lungs. It was found, however, that this was not a problem. The structure of the respiratory tract is such that it is relatively easy for air to escape, although it may be very difficult for air to enter. This is caused by the fact that the vocal cords are tented in an upward direction and that both the epiglottis and the soft tissues of the throat may form a one-way valve. Air pressure from above may tend to make the obstruction worse by pushing the tissues more closely together, but air pressure from below separates the tissues and allows relatively free exhalation.

The insertion of a needle into the trachea might be expected to produce mechanical difficulties. The procedure, however, is an accepted one for the introduction of local anesthetic agents prior to endoscopy. Complications due to the introduction of a needle may be either traumatic or infectious. Neither of these, however, is of frequent occurrence. The possibility that these complications might occur does not detract from the use of the technique for local anesthesia, nor should it be a deterrent to the use of this technique as a lifesaving procedure. Neither of these complications occurred in this small group of patients.

The introduction of oxygen through the transtracheal needle might be a cause of complications. If the point of the needle were not located within the lumen of the trachea, subcutaneous emphysema would occur. A small amount of subcutaneous emphysema was noted in one patient not included in this series, in whom the procedure was done as an emergency measure. In addition, if the point of the needle were to enter a blood vessel, the possibility of air embolism would exist. This has not been known to occur. It must be strongly emphasized that the administration of oxygen should not be begun unless the operator is certain that the point of the needle is within the lumen of the trachea. At the time that the needle is introduced, a syringe is attached to it and air is aspirated from the trachea repeatedly. Free movement of the plunger of the syringe indicates that the needle is properly placed. An additional complication might be the perforation of other structures by the needle if it were improperly placed. In children, particularly, since the tracheal walls are not very rigid, it would be possible to insert the needle into and through the trachea and penetrate the tissues behind it. This must be guarded against by very careful introduction of the needle and by securing it firmly in place.

Summary and Conclusions

Respiratory obstruction may occur as a complication of general anesthesia. Usually this can be treated by simple measures. If these are not effective, endotracheal intubation or tracheotomy should be performed. If these cannot be done for any reason, transtracheal insufflation of oxygen may be utilized as a stopgap measure. Oxygenation can be maintained by this technique for periods of 30 minutes or longer. Within this time skilled help can usually be obtained for definitive treatment of the respiratory obstruction. It is not recommended that transtracheal resuscitation be used as a substitute for endotracheal intubation or tracheotomy, but it can be of value for a relatively brief period for the prevention of death from anoxia.

ADVERSE REACTIONS TO MEPROBAMATE

Henry T. Friedman, M.D.
and
Willard L. Marmelzat, M.D., Beverly Hills, Calif.

• *Adverse reactions seen after the administration of the tranquilizing drug meprobamate included cutaneous, muscular, gastrointestinal, and paradoxical cerebral effects. The cutaneous effects, seen in five cases, were chiefly purpuric and accompanied by intense itching; one 400-mg. tablet of meprobamate sufficed to produce the skin lesions without previous exposure. Temporary palsy of extraocular muscles produced diplopia in one case; severe diarrhea occurred in another. Paradoxical cerebral reactions in the form of extreme excitement were seen in three cases. The seven case histories here given illustrate the intensity and reproducibility of these reactions. All patients recovered after the drug was withdrawn; recovery was hastened by the use of antihistaminics, corticotropin, topical applications, and colloidal baths.*

Meprobamate is a drug that has received extreme widespread acceptance by the medical profession of the United States as well as by the general public. Scarcely a day goes by without some laudatory mention of this wonderful new tranquilizing drug in the daily press, in national lay periodicals, and even through radio and television mediums. Particularly in the area in which we practice is this compound being used indiscriminately for a tremendous number of patients by a large number of physicians. The desire for a harmless pill that will almost magically return man into a bucolic, idyllic emotional state free from everyday stresses and strains is a deep-rooted one. There is extreme paucity of pharmacological and clinical reports on this compound. Likewise, to our knowledge, no clinical reports have been published of toxic, idiosyncratic, or allergic reactions. The drug has been on the clinical market for only approximately one year, and we feel that it is time to warn the medical profession of possible toxic and allergic reactions to this compound. The only clinical reports published to date are by Selling[1] and Borrus.[2]

Clinical Instructor in Medicine, University of California at Los Angeles (Dr. Friedman), and Chairman, Department of Dermatology and Syphilology, Queen of Angels Hospital and Santa Rita Clinic, Los Angeles (Dr. Marmelzat).

Pharmacology

Meprobamate, or 2-methyl-2-*n*-propyl-1, 3-propanediol dicarbamate, was first synthesized by Ludwig and Piech[3] in 1950. It is stable in both gastric and intestinal juices and is relatively insoluble in water. The original pharmacological and toxic actions were studied in animals by Berger,[4] utilizing rats, mice, dogs, cats, rabbits, and monkeys. Meprobamate resembles mephenesin in producing reversible paralysis of the voluntary muscles without significantly affecting autonomic functions. It acts on the central nervous system and, in fact, inhibits internuncial circuits. It is antagonistic to strychnine and counteracts symptoms from released inhibitions during light anesthesia. It also augments anesthesia with barbiturates. There is little direct action on the muscles, no effect at myoneural junctions, and no blocking of conduction of peripheral nerves. Closely related to mephenesin, it has a much longer duration of action and is rapidly absorbed through the gastrointestinal tract. The latent period for action of the compound is as long as the duration of action once it is established. No nausea or emesis is produced in dogs, monkeys, or man. Approximately 10% is secreted unchanged and the remainder conjugated with glucuronic acid in the urine.

Report of Cases

Case 1.—A 55-year-old female was placed on meprobamate therapy, 400 mg. twice a day. After the patient had taken the second pill, severe diarrhea developed, with cramps, gas, and nine watery stools in 24 hours. Medication was discontinued at once, and 48 hours were permitted to elapse before the readministration of one 400-mg. tablet orally, which produced diarrhea within one hour.

Case 2.—A 73-year-old male was given meprobamate, in a 400-mg. tablet, to relax him because of coronary artery disease and chronic cardiac decompensation. Four hours after initial ingestion of the tablet he had chills, and within six hours he had an eruption that was purpuric and maculopapular in type. The rash occurred pubically and about the pelvic girdle, anteriorly and posteriorly, and in both antecubital fossae. Itching was marked and extreme in character. Twelve hours after the patient's ingestion of the pill, the eruption began to clear. It took three days to entirely disappear. One week later the patient was given 200 mg. of the same compound, in four hours itching began, and after five hours the eruption began to appear. It was less severe but in the same locale and presented similar primary lesions. On March 20, 1956, one 400-mg. tablet was given orally experimentally, and four hours later the eruption began to appear. This was quite severe, as in the original outbreak. There seems to be no doubt of the cause-and-effect relationship of this drug and the appearance of the rash. This patient had never had a drug eruption before nor had any known allergic symptoms.

Case 3.—A 33-year-old female, without prior history of allergic disease or sensitivity to drugs, received 400 mg. of meprobamate four times a day for 15 days. On the 16th day she developed a small group of violaceous maculas on the midback. Rapidly, within a period of two days, the eruption became generalized over the entire body in a symmetrical fashion, with maculas, papules, and small vesicles. All the lesions were purpuric in nature and showed a tendency toward coalescence. The mucous membranes were not involved. Medication was discontinued, and the patient was treated with corticotropin (ACTH), 80 units per day intramuscularly, plus colloidal baths and topical therapy. She recovered in one week. Later she was given one 400-mg. tablet of the same drug and developed a similar eruption on the back of the trunk. Biopsy and histopathological diagnosis of the initial site on the back gave the following findings. The epidermis exhibited alternating exaggeration and diminution of the granular layer with slight surface hyperkeratosis. The capillary tufts were dilated, with moderate thinning of the suprapapillary plates. The most general change was noted in the cutis and consisted of plasmocytic and lymphocytic periadnexal and pericapillary infiltration in a collarette arrangement. The patient's serologic tests for syphilis were negative.

Case 4.—A 49-year-old female had no history of any drug sensitivity except for the development of a pruritic dermatosis involving the right breast, both axillas, the back, and the inguinal region two years previously, after the systemic administration of penicillin. She had no other history of allergic or atopic disease. She had been instructed to take 800 mg. of meprobamate at six-hour intervals for nervousness. After the first dose of 800 mg. she developed an acute eruption involving the right breast, both axillas, the back, and the entire inguinal area. Examination revealed an acute process, involving the skin of the right breast, back, axillas, inguinal folds, and vulvar areas. This consisted of an erythematous base, with a loosely adherent furfuraceous scale. Borders of the lesions were not clearly demarcated. Diascopic examination produced a complete blanching of the erythema. Mycologic cultures and scrapings revealed no pathogenic growth. Therapy consisted of medicated baths, compresses with dilute alibour water, topical administration of hydrocortisone cream, and antihistamines given parenterally. The patient's eruption disappeared within 72 hours. Five days later 400 mg. of the meprobamate orally produced the same eruption in the same area within three hours.

Case 5.—A 51-year-old female took four 400-mg. tablets of meprobamate per day for one week prior to the onset of an eruption on her back. In a 48-hour period the eruption spread rapidly to involve her neck, both upper extremities, and the upper thighs. The pruritus was most intense. There was no history of any previous allergic or atopic diseases. She had been given one x-ray treatment and medication topically by another physician and was seen by us five days after the onset of the original lesion. Examination revealed the presence of a symmetrical eruption over the back, neck, thighs, and upper extremities, with the wrists being particularly involved. Eruption showed a faint red morbilliform pattern, with a tendency toward confluence in the large macular areas. The mucous membranes were not involved. The patient improved rapidly under treatment with colloidal baths, corticotropin, 60 units per day for five days, antihistamines orally and by intramuscular injection, and hydrocortisone cream topically. One week later the patient took one 400-mg. tablet of meprobamate, and pruritic, erythematous maculas recurred in the identical areas previously involved within approximately three hours after the ingestion of the medicament.

Case 6.—A 45-year-old male took one 400-mg. tablet of meprobamate, and three hours later there was a marked erythema of the genitalia and the inner aspects of both thighs. Itching was severe, and the lesion was red and macular in type. The patient was placed on therapy with antihistamines orally, and the rash cleared up in approximately three days.

Case 7.—A 32-year-old female was given 400 mg. of meprobamate every morning for two days without any therapeutic effect or ill-effects. The next day she took 800 mg. at 4 p. m. At 8 p. m. diplopia accompanied by nausea developed. This lasted until she fell asleep. The next day she was well. The patient has developed generalized dermatitis from penicillin. She has had hay fever, eczema, and bronchial asthma since early childhood.

In addition, there were three cases of paradoxical reaction to meprobamate of extreme excitement rather than tranquilization. After two tablets in each instance the meprobamate therapy was discontinued. One tablet subsequently produced excitement and nervousness within one hour after oral administration.

Comment

Although there were only sparse reports in the literature regarding this new drug and no samples were sent out to practicing physicians for trial, meprobamate, marketed by two related established drug companies under two different names, has been sold from coast to coast in great quantity. Almost a year was required for the production to equal the demand. From various physicians in our area, we found that many internists have seen several patients with drug eruptions from meprobamate. Some cases have been so severe that hospitalization and treatment with intravenously given corticotropin were required. In an occasional case the life of the patient was in actual danger. No one to date, however, has reported these cases in clinical literature. We have learned of cases with generalized urticaria, the localized fixed drug-type eruption, and the morbilliform toxic-type drug eruption. Basically, the lesions we have seen fall into four categories, namely, muscular paralysis, intestinal hyperactivity, dermatological reaction, and paradoxical reaction.

From the pharmacology of the compound,[4] muscular paralysis with a large dose would appear to be a real possibility. For ocular palsy to occur from two tablets (800 mg.) seems impossible; yet it occurred in one patient. Intestinal hyperactivity from a muscle-relaxing compound that is said to have no autonomic nervous system effects seems rather paradoxical, as in case 1. On the other hand, paradoxical reactions, where sedation is expected and excitement is produced, have long tradition in regard to the barbiturates and other sedative compounds.

The skin lesions were interesting, in that the sites of predilection appeared to be the pelvic girdle area, the breast area, and the flexor surfaces of the arm. Less commonly involved were the trunk, anteriorly and posteriorly, and the legs. More remarkable was the fact that a patient who had never taken the compound before would develop the reaction within three to five hours after taking one tablet. Usually in drug eruptions the patient has had prior contact with the compound before developing dermatitis medicamentosa. In other words, prior sensitization is required before a reactive state is created, which on reexposure gives a clinical allergic response. A possible explanation of this phenomenon is that these patients have been exposed in the past to chemically related compounds such as mephenesin. No percentages of toxic reactions can be given, as we have no idea of the morbidity of adverse reactions in a large definitive series of patients on therapy with this compound. However, Selling[1] reported on 187 patients without any adverse responses in 1955.

Summary

As a result of administering a new tranquilizer, meprobamate, we have seen three cases of paradoxical excitement, one case of intestinal hyperperistalsis with rice water stools, one case of palsy of the extraocular muscles with diplopia, and five cases of skin lesions, chiefly but not solely purpuric in nature, extremely pruritic, and with a predilection for the lesions to appear first in the pelvic girdle area, genitalia, and groin in both males and females. As yet no severe exfoliative dermatitis has been seen, though this appears to be a likely prospect. Initial exposure with one 400-mg. tablet of meprobamate may produce the skin lesions in less than four hours. Meprobamate has the potential of producing a number of diverse dermatological patterns that may be confused with other dermadromes. No mucous membrane lesions were seen.

A STATEWIDE PROGRAM FOR HOSPITALIZATION OF THE INDIGENT

H. Phillip Hampton, M.D., Tampa, Fla.

• *The provision of hospital care for the indigent in Florida has been a responsibility of the individual county governments, but the unevenness of budgeting and frequent evasion of responsibility has made the county line, for some patients, a barrier to good medical care. Recent legislation has made it possible to initiate a program for hospitalizing the acutely ill indigent by creating a state and county matching fund out of which payments can be made directly to hospitals for the costs of caring for certified indigents. Further decisions will have to be made concerning outpatient care for the indigent and compensation to physicians for indigent medical care. The Florida Medical Association has authorized a foundation fund to promote graduate medical education in hospitals, provide outpatient care for the indigent, and encourage better medical care throughout the state. It is recognized that indigence itself is a disease that needs to be eradicated, and that the primary purpose of medical care must be rehabilitation of the patient to independence.*

To provide good medical care for the people of the United States today requires no departure from traditional principles of the medical profession that have been paramount in achieving the finest state of health of any nation in the history of mankind; but, on the contrary, to meet the problems of medical care in a modern, rapidly growing, largely urban population, these traditional principles require emphasis and novel application in a cooperative manner. If we are to resist the pressure for complete state control of medicine and to successfully defend the principle that a free medical profession can best and most economically administer medical care to the American people, then we must present positive plans for such care for all of the people. Voluntary health insurance appears the answer for the majority, but the indigent, by definition, cannot afford the premium.

Chairman of the State Advisory Council on Hospitalization Service for the Indigent.

Read before the Section on Preventive and Industrial Medicine and Public Health at the 105th Annual Meeting of the American Medical Association, Chicago, June 14, 1956.

Care of the poor is a measure of civilization, but indigency must be recognized as a disease, the end-result of several causes—economic, sociologic, medical, and political. The judicious use of aid may relieve suffering and perhaps help to remove the cause of indigency, but indiscriminate welfare programs, especially politically inspired, will be insidiously destructive of initiative and create more dependency. The treatment of indigency must be specific; a panacea will lead only to addiction. The goal of successful therapy must be rehabilitation to independence.

Preliminary Study

In 1954 the Florida Medical Association requested the state's governor to name a committee to study the rapidly growing problem of hospital care for the acutely ill indigent in the state. The request was motivated by concern that many indigent persons in some parts of the state were not getting proper medical care, by the fact that hospitals were required to absorb much of the cost of caring for the acutely ill indigent person, and, by the hope that in providing an adequate correlated statewide program for care of the acutely ill indigent the cause of some indigence could be eradicated. In order to simplify the initial study, hospital care for the chronically ill indigent and compensation to physicians were not included. It was assumed the doctors of Florida would continue their services to acutely ill, hospitalized indigent persons without charge, pending further study.

The committee report published in two volumes presented the following major findings: Although the Florida constitution charged the county governments with the responsibility of providing hospital care for the indigent, the majority of counties either ignored the responsibility or budgeted an amount entirely inadequate to provide proper hospital care. As a result, (*a*) hospitals were usually required to absorb all or part of the cost of indigent hospitalization and passed this cost on to paying hospital patients and (*b*) the county line often acted as a barrier to good medical care and prevented efficient use of existing hospitals established under the regional hospital system in neighboring counties. The absence of a statewide plan for hospitalization of the acutely ill indigent tended to encourage the creation of an all-charity hospital in each county, a deceptively costly and undesirable method of providing hospitalization by "class." (A major finding of the Hoover commission task force on federal medical services was the wasteful inefficiency of the national, undemocratic practice of providing hospital care for the sick by "classes"—separate hospitals for veterans, merchant seamen, federal employees, and each of the military services.)

There are two groups of individuals unable to pay for medical and hospital care: (*a*) those persons on the state welfare rolls who require public assistance for food, clothing, and shelter and (*b*) those persons who, after proper investigation, are found able to provide the basic necessities for themselves but cannot meet the cost of medical care and hospitalization—the medically indigent. The latter group is being rapidly increased by the influx to Florida of new permanent residents, many of whom have retired on small pensions. Medical services to the indigent granted gratuitously by physicians of the state cannot be easily evaluated, but a cursory inquiry indicates that many millions of dollars' worth of free services are given each year. A physician may give his services without cost to anyone but himself; however, there is no such thing as free hospital care—someone must pay the bill. Determination of indigence and provision of relief can best be administered at the county government level, and the local governments should be encouraged to assume their responsibility and coordinate their efforts.

The committee recommended establishment of a uniform system of hospitalizing the acutely ill indigent by creation of a state and county matching fund out of which payments might be made directly to hospitals for the costs of caring for certified indigents. It recommended that the fund be administered through the state board of health, with authority to regulate methods of determining indigence, approve hospitals, establish uniform methods of hospital accounting, and determine hospital cost rates; the board would cooperate with other state and federal agencies in providing hospital care for the indigent.

Method of Operation of Program

The recommendations were enacted into law by the 1955 Florida legislature and became effective Jan. 1, 1956. Although the initial appropriation was inadequate, the program has been adopted by about one-third of the counties and has created widespread interest in the problem of hospitalization of the indigent. The program is administered through the county health officers and is flexible enough to meet the individual problems of each county. The health officer may delegate determination of indigence and other duties to qualified agencies. A one-page form is used by the physician who makes the diagnosis and refers the patient for hospital admission, by the social worker who determines indigence, and by the hospital for the bill.

A Hospital Service for the Indigent Fund may be set up in each county, to which the state will contribute not more than the amount spent by the county for hospital care of the acutely ill indigent, or the county may send the entire amount it has budgeted for hospital care of the acutely ill indigent to the state fund, from which hospital bills may be paid directly. The state welfare board has expressed the desire to provide hospitalization for acutely ill indigent persons who are receiving welfare aid and has pooled funds for use through the Hospital Service for Indigent program, which in effect provides welfare recipients with adequate hospital insurance. This coordinated program as initiated by the Florida Medical Association will provide better hospital medical care for the indigent, with a more equitable distribution of costs and full utilization of existing hospital facilities.

Plans for Further Development

Further development of this plan of hospital care for the indigent may offer far more to the people of Florida and the medical profession, but major decisions of policy are required to direct the development, and the decisions should be made by the medical profession concerning (1) outpatient care for the indigent, (2) graduate medical education in hospitals, and (3) compensation to physicians for indigent medical care.

It is obvious that good outpatient care for indigent persons would often prevent the necessity of hospitalization, provide better selection of hospital cases, and permit earlier discharge of patients. It would be a logical development of indigent medical care economically and medically. The control of outpatient services must be supervised by the medical profession for the most efficient and effective administration of medical care.

Graduate medical education in hospitals has become a prerequisite for adequate medical training and a potent influence in improving hospital care. The imminent development of two medical schools in Florida accentuates the need for improved postgraduate medical educational facilities throughout the state. Improved graduate medical education in hospitals will provide better medical care for the indigent more economically, for nothing is more costly than cheap medical care.

The traditional compensation to physicians for medical care of the indigent has been the satisfaction of helping to relieve suffering and aiding the progress of medical knowledge. Recently several government medical care programs have offered fees for some medical services to hospitalized indigent persons. Acceptance of such fees is a small price for which to sell the heritage of American medicine, for, if the physician accepts government fees for care of the indigent, can he logically oppose government-paid medical care for all? In practice it has been found that payment of fees for medical service to the indigent does not encourage the best medical talent to participate, but providing medical care to the indigent in conjunction with a medical education program attracts voluntary services of the most able physicians. In this manner the liability of indigent medical care may be converted into a valuable asset to the community and foster better medical care for all of the people.

The Florida Medical Association has authorized a foundation fund to promote graduate medical education in hospitals, provide outpatient care for the indigent, and encourage better medical care throughout the state. The medical profession can best administer such a program to achieve the greatest beneficial effect from the funds expended. The coordinated development of outpatient facilities for indigent medical care and graduate medical education in conjunction with the Hospital Service for Indigent program, with hospitals throughout the state used to maximum efficiency, will require study and careful planning. Such a pilot demonstration research project has been described and a grant requested for financing the study.

Conclusions

Free medical care to the poor has been a humanitarian principle of the medical profession that has been found to yield additional rewards in fostering cooperation among physicians and promoting medical education and research. Recently, however, medical care of the indigent has fallen into government hands, largely because of the overwhelming magnitude of the problem in urban communities, but also to some extent due to default by the medical profession, whose members have become preoccupied with rapidly advancing technical and scientific achievements to the neglect of traditional interest in medical problems of the community and affairs of government.

The smaller government (county) units should be encouraged to assume their responsibility to provide hospitalization for the indigent, and the medical profession should continue services to hospitalized indigent persons without the individual physician accepting government fees. Physicians should provide medical services and administer the program of medical care for the indigent in a cooperative manner to improve graduate medical education and medical care for all.

Rehabilitation to independence must be the primary purpose of medical care in order to effectively eradicate the disease of indigence. Intelligent administration of indigent medical care programs by cooperative effort of the medical profession will provide opportunity for rewards far beyond the medical service rendered.

706 Franklin St. (2).

Alkaptonuric Arthritis.—Alkaptonuria is a rare inborn error of metabolism in which occurs a defect in the breakdown of the amino acids phenylalanin and tyrosin. Katabolism stops at the stage of homogentisic acid, which is excreted in the urine. There it slowly oxidizes, producing the characteristic dark colour. The disease is inherited as a Mendelian recessive character. Almost all alkaptonurics by the time they reach middle life develop ochronosis, a pigmentation of the cartilage and fibrous tissues of the body. Secondary degenerative changes in articular cartilages and intervertebral discs cause a widespread arthritis. Less than one hundred cases of this form of arthritis have so far been described. Few instances have been recorded in patients under thirty and most have reached forty before joint symptoms are noticed. Although alkaptonuria has an approximately even sex distribution, alkaptonuric arthritis is much more common in men. Although most patients develop a stiff spine, only about half of them have serious pain in the back. Deformity, never great, is caused by narrowing of the intervertebral discs. The joints of the shoulder girdle are frequently involved, usually the gleno-humeral joint, but sometimes, as in the case described by Leslie (1943), the sterno-clavicular joint. Knees and hips are affected but the smaller joints rarely so. Radiographs of the spine in established ochronosis are diagnostic. The thoracic and lumbar discs become narrow and calcified. The calcification is diffuse throughout the disc, sparing only the peripheral few millimeters and the hyaline plates against the vertebral bodies. It is also discrete from the osteophytic lipping on the vertebral margins.—A. J. Harrold, Alkaptonuric Arthritis, *The Journal of Bone and Joint Surgery*, May, 1956.

HOSPITAL AND MEDICAL FACILITIES SURVEY AND CONSTRUCTION PROGRAM

John W. Cronin, M.D., Washington, D. C.

• *There is an imperative need for leadership by the medical profession in programing all categories of health facilities at the community level. Funds have been authorized for hospitals and related health facilities, for nursing homes, for diagnostic and treatment centers, for ambulatory patients, and for rehabilitation facilities by virtue of the Hospital Survey and Construction (Hill-Burton) Program instituted in 1946 and the Medical Facilities Survey and Construction Amendments of 1954. The total annual authorization of this program is 210 million dollars. The actual annual appropriations have averaged about one-half of the authorization. The total estimated cost of the 2,905 projects approved (May, 1956) amounted to 2.284 billion dollars. The federal contribution is 740 million and is matched by sponsor's funds amounting to 1.544 billion dollars. The current estimated bed deficit in the United States and territories, as reflected by the official Hill-Burton state plans, is 850,000 beds. Developments under this program have been substantial but slow. The public health physician and the private practitioner form the team to which the citizens look for guidance in these matters.*

The Hospital Survey and Construction (Hill-Burton) Program was instituted in August, 1946. Its purpose is to make available adequate hospital, clinic, and similar services to all the people through a program of grants to states for survey and planning and to provide grants on a matching basis to assist in the construction of public and voluntary nonprofit hospitals, public health centers, and related facilities. The facility must fill a community need and may be new construction or the remodeling or enlarging of existing facilities. The project sponsor must initiate the project and is responsible for its operation. The federal government provides financial assistance, sets minimum standards of construction, and by law, is restricted from the selection of personnel in the operation of, or in exercising any supervision or control over the administration of, the completed facility. All projects must be nonprofit or public in type, must render a community service, and must not discriminate on the basis of race, creed, or color.

Funds

The Medical Facilities Survey and Construction Amendments of 1954 authorized categorical funds for hospitals for the chronically ill and impaired, nursing homes, diagnostic centers or diagnostic and treatment centers, and rehabilitation facilities. Federal funds were appropriated to match state funds to survey the need for hospitals and medical facilities prior to the utilization of the construction funds within the respective states. The program in the states is administered by a single state agency, which in all but eight states is the health department.

As of May 1, 1956, the total estimated cost of all facilities approved amounted to 2.284 billion dollars. The federal contribution is 740 million dollars and is matched by sponsor's funds amounting to 1.544 billion dollars. There have been 2,905 projects approved. Of these, 2,035 projects providing 94,566 beds have been completed and are in operation, 553 projects adding 24,915 beds are currently under construction, and 317 projects adding 11,580 beds are in the preconstruction stage. A total of 131,061 hospital beds, 619 public health centers, and many other adjunct facilities are being added to our nation's reservoir of health facilities.

The majority of all approved applications (73%) are for general hospitals with a total of 94,928 beds; 3% are for mental hospitals with 13,047 beds; 2% are for tuberculosis hospitals with 8,478 beds; 2% are for chronic disease facilities with 7,484 beds; 19% are for public health centers; and 1% is for other related health facilities. It should be pointed out that the terms beds and bed shortage are always symbolic of services and service deficits. Twenty per cent of the total funds went to teaching institutions, including 37 university medical school hospital projects. Of the 1,057 new hospitals, about 55% are located in towns under 5,000 population, while only 11% are in cities of 50,000 or more. The civil defense implications are obvious. Five hundred thirty-five new general hospitals are located in areas in which no hospitals existed prior to the beginning of the program.

The total annual authorization of this program is 210 million dollars. The actual total annual appropriations have averaged about one-half of the authorization. The estimated bed deficit in the United States and territories, as reflected by the official Hill-Burton state plans, is 850,000 beds. Progress in alleviating this shortage is slow because of annual population increase and the physical and functional obsolescence of the nation's existing hospital resources.

In 1955, $1,200,000 of federal funds was appropriated for research, experiments, and demonstrations in hospital services, facilities, and resources by the Public Health Service and also through grants to states, universities, and nonprofit organizations. These funds have been allocated to 27 applicants, and a wide range of studies are under way. It is anticipated that these studies will add a great deal of information in regard to a better utilization of hospitals and medical facilities as well as develop newer methods of better patient care.

Health Maintenance

The modern medical program for the individual is one of health maintenance. This requires a fusion of curative, preventive, and restorative services. The public health physician and the private practitioner form the team to which the citizens look for guidance, leadership, and assistance in all health matters. There must be mutual understanding, mutual trust, mutual respect, and a spirit of complete cooperation between these health leaders. The public expects it; the patient requires it. Public health physicians must be interested and active in medical care problems and services. The

Chief, Division of Hospital and Medical Facilities, Public Health Service, Department of Health, Education, and Welfare.

Read before the Section on Preventive and Industrial Medicine and Public Health at the 105th Annual Meeting of the American Medical Association, Chicago, June 14, 1956.

private practitioner likewise must know more about and actively support public health practices. Anything less will result in quasiprofessional leadership in total health matters and less than appropriate and satisfactory health services to the individual and the mass of individuals known as the public. We as physicians must meet this situation objectively and with forthright actions. It is our responsibility and our obligation to accord leadership in matters of health so that the patient may be accorded health services of the highest quality and devoid of distracting influences, which can only detract from the quality of patient care rendered.

The demands of high-quality patient care today require the utilization of diagnostic instruments of precision that are complicated, expensive, and ever on the increase. They serve to assist the physician to practice scientifically. They supplement his efforts in practicing the art of medicine. Instruments of precision per se have little value. They require proper utilization in a proper setting by skilled users, and, above all, judgment and interpretation in the application of their results by the physician in the light of his findings after the acquisition of the history and the examination of the patient. The contributions of the chemist, the physicist, and the engineers to the development of modern instruments of precision have been enormous and of great value. The capital costs required for those instruments are great and perhaps will increase as new ones and ways of utilizing them are developed.

In many communities the hospital serves as the mobilization depot for diagnostic instruments of precision as well as providing the clinical laboratory service facilities. Frequently located at or near the hospital are found physicians' offices, and in many areas the public health facilities of the community are adjacent. In such arrangements, a true medical center has developed and total health maintenance programs are developing.

Needs of Chronically Ill

One of the current problems in medical care relates to provision of facilities and type of care designed to meet the needs of the chronically ill and impaired. Many such patients do not require the usual hospital services and yet do require skilled nursing care under a physician's direction. Frequently this type of care is beyond the facilities to be found in a home. These factors, among others, underlie the development of the nursing home designed for and operated to provide skilled nursing care and in which the patient is under the attending physician's care. This type of nursing home is an essential part of the constellation of medical care facilities. The standards of design and construction, as well as those for the quality of services rendered in such nursing homes, should meet the demands of its patients just as specifically as in the modern general hospital of today we find standards of design and construction and standards of operation for the acutely ill.

It has been estimated that at least 25% of the general hospitals' patients are chronically ill. Many of these can be adequately cared for in a skilled nursing care home at less than one-half of the per diem cost of care in the general hospital. In addition, the construction costs per bed are considerably less than for the average general hospital.

The medical care of our ever-increasing group of citizens over the age of 65 years demands special consideration. When one realizes that each day about 1,000 people join the more than 13 million others who are over 65 years of age in this nation, and that many of them currently have or may acquire chronic illnesses and impairments, one must deduce that the need for medical leadership is great in developing resources for the aging. Facilities for day care and others for night care only are being planned. These types of facilities require medical services in many instances.

Rehabilitation and Health Education Programs

There is need for advice of physicians in developing and planning the housing facilities for persons seeking intensive diagnostic services through their attending physicians at the health and medical centers on a noninpatient status. The scope, character, and extent of diagnostic services that may be appropriately accorded require medical opinion and judgment. The contributions of the physician to industry in assisting in the planning for the employee programs to more closely relate the total capacities of the individual to the demands of the job are invaluable to management and of greatest importance to the employee. This area of activity of the physician, as in his services to the chronically ill and impaired, brings to the forefront his role in rehabilitation programs. It is essential and requires his keenest judgment and taxes his faculties of leadership.

The 1954 amendments to the Hill-Burton program relating to the survey of need for and assistance in the construction of chronic disease facilities, diagnostic or diagnostic and treatment centers, nursing homes, and rehabilitation facilities were designed to induce sponsors to develop planning for and to construct these needed types of health facilities. This aspect of the program is developing slowly and brings into focus the quality of care to be accorded through our health facilities. The need for and responsibility of leadership by the medical profession in programing all categories of health facilities at the community level are imperative and must be accepted by every competent physician. Many physicians have done just this in many communities. The public health physician has inherent in his position the health of the public. As with the private practitioner, one of his most effective tools is a health education program. In my opinion health education and research are basic to all health programs. There is need for much more of each. The public health physician should enter the field of research in medical care and effectuate the application of the research studies. The public health physician is a doctor of medicine by training and by experience has acquired a broad appreciation of the basic needs of people in the health area. His qualities of leadership and his unique knowledge relating to the problems supporting total health maintenance programs are needed by the private practitioner and the general public. His obligation is to make his contribution effectively. Who else is better qualified by training, experience, and interest?

330 Independence Ave. (25).

MOVEMENT IN DIAGNOSIS AND TREATMENT

Frances Baker, M.D., San Mateo, Calif.

• A study of the patient's movements is essential to physical diagnosis, and a study of such movements is the basis for treatment of locomotor dysfunction by exercise. Both diagnosis and treatment require a knowledge of the rhythm of movement obtained not only by research but by the development of a fine sense of "feel" and a degree of manual dexterity that can be acquired by constant practice and that, therefore, cannot be taught didactically. The doctor must learn to work with his hands when treating his patients in an attempt to reestablish functional movements. Then he can transfer his ideas and techniques by demonstration, better than by words, to his staff. The physiatrist is equipped especially to use physical agents for diagnosis and treatment. These agents should not be neglected. Exercise for the purpose of reestablishing functional movement to as nearly normal as the pathology will permit is of greatest importance, yet careful study of its application has been neglected.

Motion is the essence of life. Like all things pertaining to life, we know little concerning it. It is an inherent characteristic of all animate things to move through space with ease and power, not only for protection but for the pleasure of doing so. Man has developed games of skill and of prowess and the dance for the satisfaction and joy of motion. When, for any reason, the rhythm of movement is disturbed it becomes a handicap to the individual, and if the ability to move is decreased or lost that individual is severely handicapped, crippled, or helpless.

The desire to reduce or correct the pathological condition or to reeducate the individual to a pattern of movement has resulted in research of many types. The methods of observation and of recording have made tremendous advances. From simple observation we have passed to photography and now to cinematography; from palpation and faradization we have moved on to electromyography; and from the kymograph we have changed to the oscillograph. We are able to observe and measure motion as it occurs in the joints under normal and pathological conditions and to determine its effect on the different parts of the body with ever-increasing accuracy.[1]

Research Pertaining to Locomotion

Locomotion, though appearing simple in the normal case, is actually dependent upon complicated mechanisms. Any information that can be obtained to give us more adequate knowledge of the mechanisms employed in locomotion is of value in directing exercise for therapeutic purposes. Information obtained from the motion picture has proved to be of assistance in analyzing the movements of the body in the three planes of motion: (1) sagittal, the plane of progression; (2) frontal, the elevation and depression that occurs with progression; and (3) horizontal, in which transverse rotary movement occurs.

One excellent project[2] can be mentioned as an example of some of the fine research that has added to our knowledge of movement and has changed many previous conceptions concerning it. This report is the result of research by a team of specialists over a period of two years at the University of California. In this study, records made simultaneously by motion picture and the electromyograph gave invaluable information on which to base conclusions. The study showed that movement in the plane of progression is accompanied by definite changes in the frontal and horizontal planes. Not only elevation and depression but rotary movement as well occur with progression in space. For instance, in general, upward or forward angular displacement of the pelvis and leg take place during the swing phase, while downward and backward angular displacements occur during the stance phase. Lateral and medial movement of the pelvis and adduction of the femur are compensated for by abduction of the lower leg. The transverse rotation that takes place in the extremity is of particular importance to a smooth gait. Study of the rotation reveals inward and outward rotation taking place from pelvis to foot, with the greater angles existing distally. Rotation takes place at joints, permitting relative rotation of one bone with respect to another. Transverse rotations of the pelvis, femur, and tibia occur in all normal individuals and seem to be absorbed in the articulations and ligaments of the foot. Inward rotation starts as the foot leaves the floor and continues to increase until the heel strikes the floor and until the extremity receives the full weight of the body. During the stance phase outward rotation takes place. If, for any reason, movement in the various planes is blocked or disturbed, the normal rhythm is seriously disturbed.

With motion pictures to show the movement in the three planes and electromyographic tracings to record the activity of the muscles in relation to the movement of the particular skeletal part, the exact time at which a muscle begins activity and the exact time at which such activity is terminated during the phases of swing and of stance can be plotted. By this study, it has been found that groups of muscles fall into the following three main classifications with regard to their important action in locomotion: acceleration, deceleration, and stabilization. We not only require information regarding movement but require knowledge concerning the muscular action that is used primarily to establish stabilization and equilibrium. These do not manifest themselves in visible motion, yet they play the most important part in locomotor performance. Some knowledge of the conditions under which the body maintains its equilibrium can provide an awareness of approaching pathological situations that can lead to a prophylactic and therapeutic regimen.[3] The

---

Chairman's address, read before the Section on Physical Medicine at the 105th Annual Meeting of the American Medical Association, Chicago, June 12, 1956.

understanding of equilibrium and of the active movement of the patient is fundamental for diagnosis and treatment. Many of these movements have come to be signs that have been given the names of those who have recognized their significance. These movements have therapeutic as well as diagnostic value.

A year ago Dr. Schmidt[3] in his chairman's address to the Section on Physical Medicine, American Medical Association Annual Meeting, reviewed the many valuable diagnostic tests that electrical currents have provided—the reaction of degeneration, chronaxy, the strength-duration curve, the galvanic-tetanus ratio, the strength-interval curve, and the electromyograph for the recording of fibrillation or degeneration action potentials. This apparatus is of distinct value in diagnosis. Equipment with which to produce heat, light, and electrical stimulation and mechanical forces is available and of value in treatment. I have mentioned only a few trends in the study of movement. Much information has been collected, and the interest is growing constantly, which will lead to better understanding of the normal states and, hence, lead to improved methods of managing pathological states.

Application of Techniques of Mobilization to Locomotor Dysfunction

The progress made in physical medicine and rehabilitation during the past 25 years has resulted in marked improvement in the recovery of patients with pathological disturbances of the motor system, since the physiatrist is vitally interested in the diagnosis and treatment of motor handicaps. The history and the various tests lead to a diagnosis and to a plan of treatment. Here it is to be emphasized that unusually valuable information can be gained by studying the performance of the patient not only at the time of examination but during the period of treatment. The first examination of the patient having severe pain or with a neurological disease may lead to a probable diagnosis but often gives little information as to how the patient will react to therapy. A more definite diagnosis may be made as the response to treatment is observed. For this reason, the doctor in charge of the patient should himself assist the patient with all parts of the program of treatment requiring movement until some relief is obtained or until a plateau is reached that will permit the development of a plan of procedure that his observing assistants, the physical therapist and the occupational therapist, will be ready to carry forward. He has gained diagnostic evidence and has used his fund of information regarding movement to speed recovery. Also, he has permitted himself to become acquainted with his patient. Confidence has been established, and the relationship between any mental strain and the physical handicap can be discussed and given a proper evaluation. The patient has the opportunity of assisting in the management of his own problem.

An example presents itself in the patient with acute low back pain. The routine history is obtained, and an examination is done that naturally includes a check of the posture, muscular spasm, mobility of the back and hips, and response of the reflexes. The possibilities of subluxation, strain, sprain, arthritis, and herniated intervertebral disk are considered, not forgetting such possibilities as malignant disease or infection. Aside from the use of manipulation when subluxation is found, the routine plan is to prescribe a program of exercise. The fundamental exercises for low back pain can be found in any textbook and are given the name of one of the various authors who has described them. Usually they are done from a supine position. They are (1) flexion of the trunk, which is accomplished by (*a*) raising both legs from the table with the knees flexed or extended or (*b*) rising to a sitting position; (2) trunk rotation, which is accomplished by flexing knees and hips and carrying the knees from one side to the other; and (3) trunk lateral flexion, which is accomplished by lifting the legs sufficiently to clear the table and carrying them to one side and then to the other.

These abdominal exercises are designed to relax the spastic muscles of the back and to lead toward flexibility and strengthening of the abdominal muscles for support. Too frequently the patient is requested to perform these exercises after being given a mimeographed description of them or a hasty demonstration. Because of pain the patient is unable to proceed. These are fundamental exercises, but if the doctor will apply them, modify them, and assist the patient with them the musculature of the back will gradually relax. The most common way of stimulating pain when trying to perform these exercises is arching the spine due to the action of the psoas muscles. The patient is taught how to maintain a flattened back by controling the tilt of the pelvis. The necessary assistance will be supplied to prevent a recurrence. The doctor will note whether lateral flexion is possible to both right and left sides. When the pain is severe it is often impossible to return from a long sitting position to the supine position. It is necessary to flex the knees and hips, thus placing the thighs firmly upon the abdomen. It is the modification of these exercises in the treatment of acute back problems that makes them valuable for treatment and valuable for differential diagnosis. It is a clinical sense or feel that the doctor develops as he treats his patient, which results in the better management of the condition and a better demonstration of techniques to be used by his staff.

The same can be said to hold true for the patient with an acutely painful shoulder, where gentle traction, discussion of relaxation, and carefully assisted-resisted motion can not only bring about relief of pain but lead to a differentiation of the various pathological conditions that affect this joint. It is not always possible to differentiate such simple things as bursitis and bicipital tenosynovitis on first examination. This is an important differentiation, since treatment of the two is so different.

The neurological diseases present like problems. This is true, for instance, where the disease produces spasticity. Though certain patterns are expected, it is surprising how much variation can be present. It often requires several periods of study before an understanding between patient and doctor permits of an analysis of the muscular activity and of the balance between antagonistic muscles, so that a correct plan for development of balanced power and use of reflex mechanisms can be put into a therapeutic program.

Physical medicine is a relatively new but important field of medicine It is a field in which the doctor actually learns to work with his hands when treating his patients Thus, the variations in the reactions of his patients come to be as much felt as recognized by routine signs The doctor's ability to apply the movements of the body in such a way as to obtain therapeutic results, as well as diagnostic evidence, is a refined art of medicine. Whether the doctor is treating a patient with acute low back pain or pathological disorder resulting in acute pain of any other motor area, or whether he is retraining motor patterns interrupted by the deformity of arthritis or by the various neurological disturbances, he can only direct his assistants to obtain the best results in a ratio proportional to his own ability to obtain results His capability depends upon his knowledge of the disease and his ability to demonstrate in a refined degree techniques that follow functional patterns.

The fundamental means to physical return are based upon the use of exercise rather than upon mechanical equipment The more expert the director of the patient is in the recognition of the pathology from the standpoint of anatomic and physiological diagnosis and from the standpoint of functional anatomy. the better the results should be. The emphasis must be placed upon reeducation of the patient in the use of his body after damage of some sort, whether trauma or disease, has caused a disability, upon education of the individual as to his assets and deficits, and, in some instances, upon education leading to social and economic rehabilitation.

Conclusions

Why we are able to move in space remains a mystery. At best we know that movement depends upon trigger-fine mechanisms of which we have some knowledge. Beyond the information that research can provide concerning motion and aside from the basic principles that can be passed along by word of mouth or the printed page, the doctor interested in the relief of crippling disease must develop not only his sense of observation but a fine sense of feel and of manual dexterity These are things that cannot be taught. An aptitude that the doctor can develop is a valuable asset. By demonstration, even more than by words, he can transfer his techniques and his ideas of management to his staff—the therapists who work with him day after day. The physiatrist is one who has chosen to make use of physical agents in the diagnosis and treatment of disease. No technique is more difficult to understand, to perform, or to teach than exercise that is for the purpose of reestablishing functional movement to as nearly normal as the pathology will permit, yet it is hard to think of a means of treatment that has been more neglected.

CLINICAL NOTES

HEMOLYTIC ANEMIA IN PATIENT RECEIVING NITROFURANTOIN (FURADANTIN)

Michael West, M.D.
and
Hyman J. Zimmerman, M.D., Chicago

Nitrofurantoin (Furadantin), N-(5-nitro-2-furfurylidene)-1-aminohydantoin, a drug related to the antimicrobial nitrofurans, has been employed in the past few years in the treatment of acute and chronic urinary infections. Side-effects include nausea, occasionally accompanied by vomiting, diarrhea, pyrosis, headaches, and urticara. No ill-effects on the liver or kidney have been reported. There is one reported instance of leukopenia after the use of nitrofurantoin.[1] There has been no other report of hematological abnormality during its use. The case reported below is thought to represent the development of hemolytic anemia with the use of this drug.

Report of a Case

A 28-year-old Negro man was admitted to the hospital on Sept 2, 1955, with the complaint of a swollen, tender penis for approximately two weeks At the onset of this swelling he had received two injections of penicillin, but had used no other drugs prior to admission to the hospital A history of polyuria and polydypsia for five months was then elicited from the patient Six years before he had pneumonia and gonorrhea, both were treated with penicillin The patient's mother had had diabetes for 40 years The father and two siblings were said to be free of any chronic disease. No history of allergy could be elicited from the patient

Physical examination revealed an obese Negro male who weighed 270 lb (122 5 kg) and was 5 ft. 9 in. (175 26 cm.) tall. He was afebrile, and his pulse rate was 80 per minute and regular. His blood pressure was 140/90 mm. Hg in both arms Except for a severe balanitis and obesity, no abnormalities were found The urine on admission was cloudy, with a specific gravity of 1.033. There was no albuminuria, but the test for sugar yielded a 4+ result and a strongly positive acetone reaction Microscopic examination showed many white blood cells, with some clumping A urine culture revealed no bacteria growth Before the results of this latter test were known, treatment with nitrofurantoin (150 mg four times a day) was initiated, and the diabetes was treated with appropriate diet and "regular" insulin

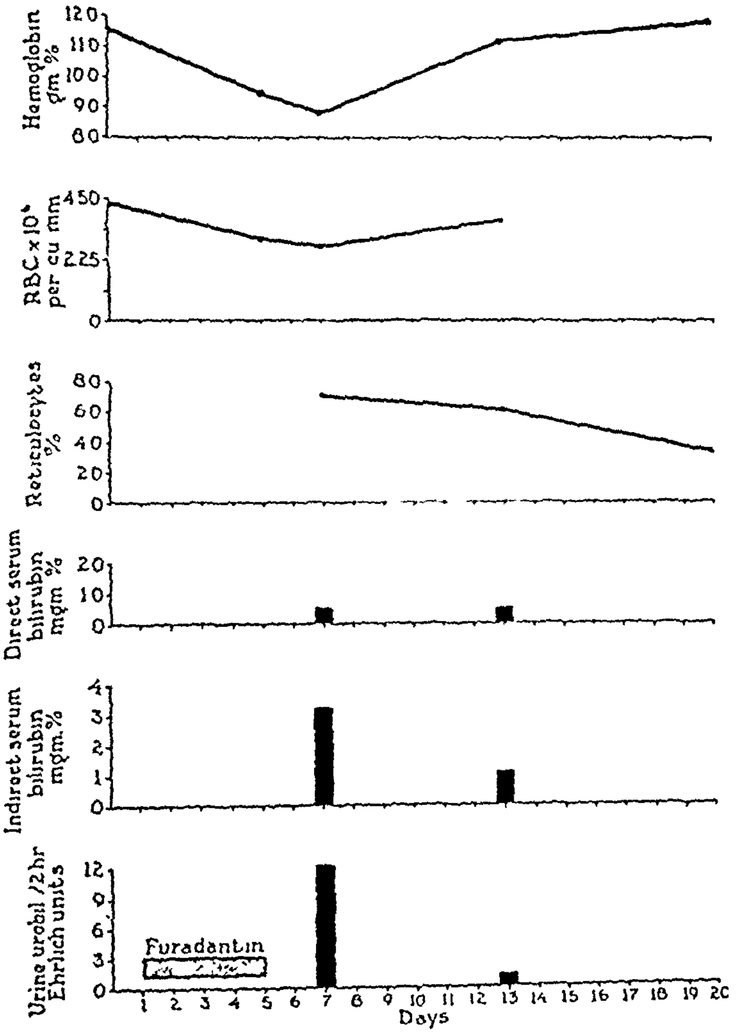
Initially the red blood cell count was 4,250,000 cells per cubic millimeter. The hemoglobin level was 11.5 gm per 100 cc. The white blood cell count was 9,000 cells per cubic millimeter, with 67% granulocytes, 24% lymphocytes, 5% monocytes, and 3% eosinophils The serologic test for syphilis was negative. On the fourth hospital day, "coffee-colored" urine was passed. Administration of nitrofurantoin was then discontinued after a total dose of 2 4 gm had been given On this day, the red blood cell count was 3,040,000 cells per cubic millimeter, with a hemoglobin level of 8 8 gm per 100 cc. (see figure). The white blood cell count was 8,650 per cubic millimeter, with 56% granulocytes, 32% lymphocytes, 6% monocytes, and 6% eosinophils The reticulocyte count was 7.4% The total serum bilirubin level was 3 2 mg per 100 cc, with a direct level of 0 5 mg. per 100 cc The urine contained 12 3 Ehrlich units of urobilinogen in a two-hour specimen tested by the method of Watson and co-workers[2] The sulfobromophthalein test revealed 7 5% retention after 45 minutes The thymol-turbidity, cephalin-flocculation, alkaline phosphatase, and protein-partition tests were all normal. There was no bile in the

---

From the Medical Service, West Side Veterans Administration Hospital, and Department of Medicine, University of Illinois College of Medicine.

urine, but hemoglobin was present. A Coombs test, performed with direct, indirect, and layering methods and with trypsinized erythrocytes, was completely negative. A sickle cell preparation was also negative. Bone marrow examination showed increased erythropoeisis and eosinophilia.

One week later, the red blood cell count had risen to 3,600,000 per cubic millimeter. The total serum bilirubin level fell to 1.2 mg., and the direct level remained at 0.5 mg. per 100 cc. The two-hour test for urobilinogen gave a normal value of 1 Ehrlich unit at this time. Three weeks later the red blood cell count had risen to 4,500,000 per cubic millimeter and the hemoglobin level to 13.3 gm.; the total serum bilirubin level at this time was 0.6 mg. per 100 cc., with a direct fraction of 0.2 mg. per 100 cc. The diabetes was well controlled with 25 units of isophane (NPH) insulin and a 1,600-caloric diet. Attempts to demonstrate a hemolytic factor in this patient's serum with nitrofurantoin used as the precipitating agent were unsuccessful. Rabbits were fed nitrofurantoin after the intravenous administration of 5 cc. of the patient's serum. Study of the rabbits' blood daily for five days revealed no gross evidence of hemolysis. Likewise, incubation of a saturated solution of nitrofurantoin in saline solution with the patient's serum and normal red blood cells gave no visible evidence of hemolysis. Unfortunately, osmotic and mechanical fragility of the erythrocytes was not determined.



Hematological and biochemical evidence of hemolysis developing during administration of nitrofurantoin (Furadantin), with recovery after withdrawal of drug.

A month and a half after the initial episode, a test dose of 100 mg. of nitrofurantoin was given to the patient. There was no significant change in the red blood cell count or reticulocyte count during a five-day observation period. After four days, however, the stool urobilinogen level rose from an initial value of 140 mg. to 266 mg. per 24 hours. The serum iron level was elevated to 173 mcg. per 100 cc. on the second day after a prior value of 145 mcg. per 100 cc. The total serum bilirubin value reached 0.9 mg. three days after a control of 0.6 mg. per 100 cc. The indirect value rose from 0.4 to 0.7 mg. per 100 cc. within this time. The urine urobilinogen level was still high four and one-half months later, the latest value being 10.3 mg. per 24 hours. The stool urobilinogen value at this time was 91 mg. per 24 hours. During a six-month period of observation of this man as an outpatient, there has been no evidence of hemolytic or other disease.

Comment

In this patient with diabetes mellitus and balanitis, a hemolytic anemia was observed while he was receiving nitrofurantoin. Evidence for this included severe hemoglobinuria, a significant urobilinogenuria, reticulocyte count elevation, a reduction in circulating red blood cells and hemoglobin, and a rise in serum bilirubin that was almost entirely of the indirect type. These values returned to normal when the use of nitrofurantoin was discontinued. The significance of the mild anemia present before the drug was given is obscure. Attempts to reproduce this phenomenon yielded inconclusive results. The observed elevations of the serum iron, stool urobilinogen, and serum bilirubin levels after the administration of a test dose were small in magnitude and within range of physiological or even technical variations. The elevated urine urobilinogen value after four months remains unexplained. The failure to demonstrate a positive Coombs test is not unusual, since cases of acquired hemolysis not due to autoimmune mechanisms may be "Coombs negative." [3]

It seems reasonable to conclude that the hemolytic anemia was related to the administration of nitrofurantoin, although this has not been unequivocally proved. Nevertheless, lack of similar episodes before the administration of the drug and during the six months since the bout of anemia support the possibility of a relationship of the anemia to the administration of nitrofurantoin. If the anemia is related to the drug, it must be an extremely rare occurrence, since no previous reports of this untoward reaction have appeared. The mechanism of hemolysis in this patient is obscure. It may be related to an unusual idiosyncrasy to nitrofurantoin much in the same manner as that reported occasionally with other drugs (such as phenlhydantoin derivatives [4] and sulfonamides [5]). It is also conceivable that there may be an intrinsic abnormality of the red blood cell in this patient analogous to the type of sensitivity in healthy Negroes to primaquine.[6] Such a defect might include an unusual susceptibility of enzyme systems involved in carbohydrate metabolism, other recent studies [7] have suggested that inherited abnormalities of red blood cell carbohydrate metabolism may be responsible for the principal hematological features of hereditary spherocytosis. It is of interest that Paul [8] has shown that citrate formation from oxalacete in testicular tissue under anaerobic conditions is inhibited by nitrofuran derivatives. Although the exact role of the nitrofuran derivatives in carbohydrate metabolism is still obscure, it is possible that this patient's hemolysis was due to the inhibition of red blood cell carbohydrate metabolism by nitrofurantoin.

Summary

A case of acute hemolytic anemia occurred in a patient receiving nitrofurantoin (Furadantin). No other known factor could be established as responsible for this phenomenon. The patient had never had any similar episodes in the past. Hemolysis subsided after the administration of the drug was discontinued and has not recurred during a six-month period of observation. It seemed reasonable to conclude that the hemolytic anemia was related to the administration of nitrofurantoin, although this was not proved unequivocally.

CERTAIN CLINICAL ASPECTS OF THE USE OF A PUMP OXYGENATOR

Earle B. Kay, M.D.

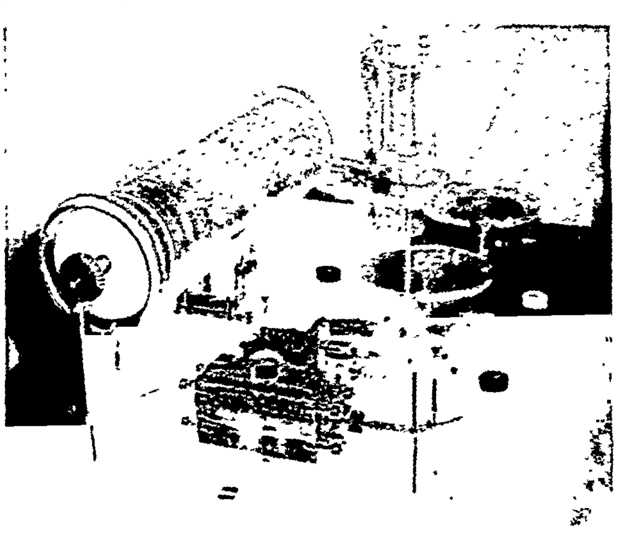
and
Frederick S. Cross, M.D., Cleveland

Various types of pump oxygenators are now being employed in the surgical correction of intracardiac anomalies. Certain basic physiological criteria will have to be satisfied with all such machines if the majority of such operations are to be successful. Only part of the responsibility for successful intracardiac surgery rests with the machine. The clinical management of the patient before, during, and after the operative procedure is equally important. Furthermore, new intracardiac surgical techniques have to be devised and perfected. Consequently, the problem of successful direct-vision open intracardiac surgery is threefold, and success is dependent upon the development of a reliable pump oxygenator that maintains the physiological requirements of the body, the clinical management of the patient, and the employment of a satisfactory surgical technique. The requirements of a pump oxygenator are that it must (1) provide the needs of the body for oxygen without the dangers of emboli or foaming, (2) not be overly traumatic to the components of the blood, (3) not interfere with the clotting mechanism of the blood, (4) maintain the body metabolites and electrolytes in equilibrium, and (5) not significantly alter the acid-base balance.

A rotating disk reservoir oxygenator with a Sigmamotor pump has been employed by us experimentally and clinically. Though trauma to the components of the blood, hemolysis, and interference with the clotting mechanism and bleeding tendency have not been a problem, a new pumping mechanism, in which hydraulic compression employed through a fluid medium is used, has been developed. This has been shown to be even less traumatic. The capacity of the oxygenator has also been increased to more than 4,000 cc. per minute for use in adults. Teflon (a tetrafluoroethylene resin preparation) disks have been found to be the least traumatic. The newly developed pump oxygenator is shown in the figure.

A fixed arterial output has not been maintained. Flow rates in the range of 40 to 80 cc. of blood per kilogram of body weight per minute have been employed (table 1). The flow rate is determined largely by the venous return and the level of the mean arterial pressure, which ranged from 40 to 80 mm. Hg during the bypasses. Heparin sodium in the dosage of 0.75 mg. per pound of body weight is employed. A minimum of 800 cc. of blood is required to prime the machine. An optimum of 1,400 cc., however, is used. The additional 600 cc. can be utilized for a reservoir. To allow time for proper regulation of the extracorporeal circulation, several minutes elapse between starting the pump oxygenator, clamping the venae cavae, and performing the cardiotomy.



Newly developed pump oxygenator incorporating large-capacity oxygenator reservoir and new pumping mechanism.

Eleven of the first 17 patients operated on had ventricular septal defects. Two of these patients had two openings, and a third had three defects. Three patients had a high-grade pulmonary stenosis. One patient had an infundibular stenosis and a subaortic stenosis, one an atrial septal defect, and another a ventricular septal defect associated with a third auricular chamber into which all the pulmonary veins except the right upper and the coronary sinus emptied. Eight of the patients had multiple defects, all but one correctable at the time of surgery. Temporary aortic occlusion was employed in two patients to prevent marked regurgitation of blood through the ventricular septal defect. Induced

---

ventricular fibrillation was employed in one patient. Cardiac standstill by aortic occlusion and by the injection of potassium chloride has been employed experimentally. This appears to be of merit in reducing blood loss from regurgitation in occasional instances and in providing a dry field for operation. Ivalon (nonabsorbable polyvinyl) sponge with interrupted suture was employed in the closure of 7 of the 11 ventricular septal defects. Confidence in the pump oxygenator is such that operations are not hurried. An analysis of the clinical data obtained in the first 17 patients operated on with the use of this type of apparatus follows.

Hemolysis and Oxygen Saturation

Table 1 presents the increase in hemolysis, in milligrams per 100 cc., occurring during the operation. If one assumes a hemoglobin level of 200 mg. per 100 cc. of serum as being acceptable, then the increase in hemolysis occurring during these operative procedures has been quite minimal. An average increase over preoperative levels of 33.4 mg. per 100 cc. was noted. As one would expect, there was a tendency toward increased hemolysis associated with increase in flow rates and increase in duration of cardiac bypass. When Teflon-coated disks were employed, hemolysis was definitely less than when siliconized disks were used.

TABLE 1.—*Data on Increase in Hemolysis During Operation*

29.2	75	19	20.5	59.4	38.8

* Av. increase 33.4.

The oxygen saturation of the arterial blood in all cases ranged from 97 to 103%, while that of the venous blood ranged from 35 to 53%. The greater blood flows per kilogram were associated with higher percentages of venous oxygen saturation, which may be beneficial but are perhaps nullified by the increased trauma to the blood as evidenced by the greater degree of hemolysis.

Acid-Base Balance and Potassium Levels

Acidosis or alkalosis has not been a great problem. The pH, carbon dioxide content, and carbon dioxide-combining power of the arterial and venous blood are determined before, during, and after the cardiac bypass. Hyperventilation prior to the perfusion tends to cause a lowering of the carbon dioxide content in the range of 30 to 45 vol. %. However, a metabolic acidosis was observed during the bypass. This appears to correct itself with restoration of normal circulation. By the addition of 1 to 2% carbon dioxide to the oxygenator, the carbon dioxide content can be regulated (table 2).

Potassium levels were determined before and after the perfusion as an index of the red blood cell destruction and as an indication of whether toxic levels might be reached during the bypass. The average potassium concentration prior to the perfusion was 3.82 mEq. per liter as compared to 4.08 afterward. This is not a significant difference.

Cellular Components of Blood and Clotting Mechanism

Trauma to the red blood cells and white blood cells did not appear to be significant, and no consistent changes were produced by the pump perfusion system (table 3). There was platelet destruction in every instance; however, this did not occur to the extent of interfering with the clotting mechanism of the blood (table 4).

At the conclusion of the cardiac bypass one-half of the calculated dose of protamine sulfate was given, based on unit for unit heparin-protamine dosage. The clotting times ranged from 3 to 9 minutes in 13 patients and from 9 to 15 minutes in the other 4 immediately after the bypass. These became normal in the next two to three hours. A slow intravenous drip of citrated blood was given routinely postoperatively to correct for the

reduction in the red blood cell count during the procedure and the loss from thoractomy drainage. The amount was regulated by subsequent hemoglobin-hematocrit determinations and the weight of the patient. In only one patient was there what might be considered an excessive amount of postoperative bleeding. Extracorporeal circulation had been used in this patient for 44 minutes. There was 800 cc. of drainage from the left thoracotomy tube within the first six postoperative hours. The data on plasma fibrinogen level and clot lysis obtained in eight patients before and after the perfusion are correlated in table 4. As noted, the plasma fibrinogen level in each instance fell during the perfusion, but only to a slight degree. There was a tendency for samples of clots taken postoperatively in this small group of cases to lyse in less time than the preoperative clot samples.

Results

There were three deaths in the first 17 patients operated on: in the 4th, 6th, and 10th. None of the deaths was due to the employment of a pump oxygenator per se. The fourth patient died eight hours postoperatively after multiple cardiac standstills (nine in number). The reason for the cardiac arrest is not clear, but it appeared to be related to placing the enlarged heart and lungs back into the small thoracic cavity. The sixth patient died 11 hours postoperatively from cerebral edema from partial vena caval restriction during the course of the operation. This patient had been in the hospital for six weeks in congestive failure prior to operation. The 10th patient died 10 hours postoperatively from an anomalous defect not recognized at surgery. This patient had a ventricular septal defect and what appeared to be a large septum primum atrial septal defect. Bright red blood escaped from this orifice. At the lower margin, dark blood from the coronary sinus was noted. Digital examination of this opening allowed the finger to go into a chamber thought to be the left atrium and into the left pulmonary veins. At postmortem examination this dilated chamber, measuring 1.5 in. in diameter, was found to be a dilated coronary sinus into which all of the pulmonary veins, except the right upper, emptied. The remaining patients had a relatively uneventful recovery.

Summary

In the first group of patients (17) operated on with use of a rotating disk pump oxygenator, there were three deaths. These deaths were not due to the use of extracorporeal circulation per se but were more closely related to the severity of the operative risk and complexity of the congenital deformity.

PEPTIC ULCER OF THE ESOPHAGUS AND ESOPHAGITIS IN GASTRIC-LINED ESOPHAGUS

Max L. Som, M.D.
and
Bernard S. Wolf, M.D., New York

In textbooks of pathology, chronic peptic ulcer of the esophagus has been described for many years as a rare condition of unknown etiology. In 1950, Barrett[1] pointed out that a congenital anomaly of the epithelium lining the lower esophagus was present in these cases and was a predisposing cause for the development of such an ulcer. In this anomaly, a variable length of the distal esophagus is lined by glandular or an atrophic type of gastric epithelium. A discrete chronic peptic ulcer in gastric-lined esophagus has been referred to as a "Barrett" ulcer by later authors.[2] The following case is an example of this congenital anomaly and demonstrates the occurrence not only of a chronic peptic ulcer but of peptic esophagitis as well.

Report of a Case

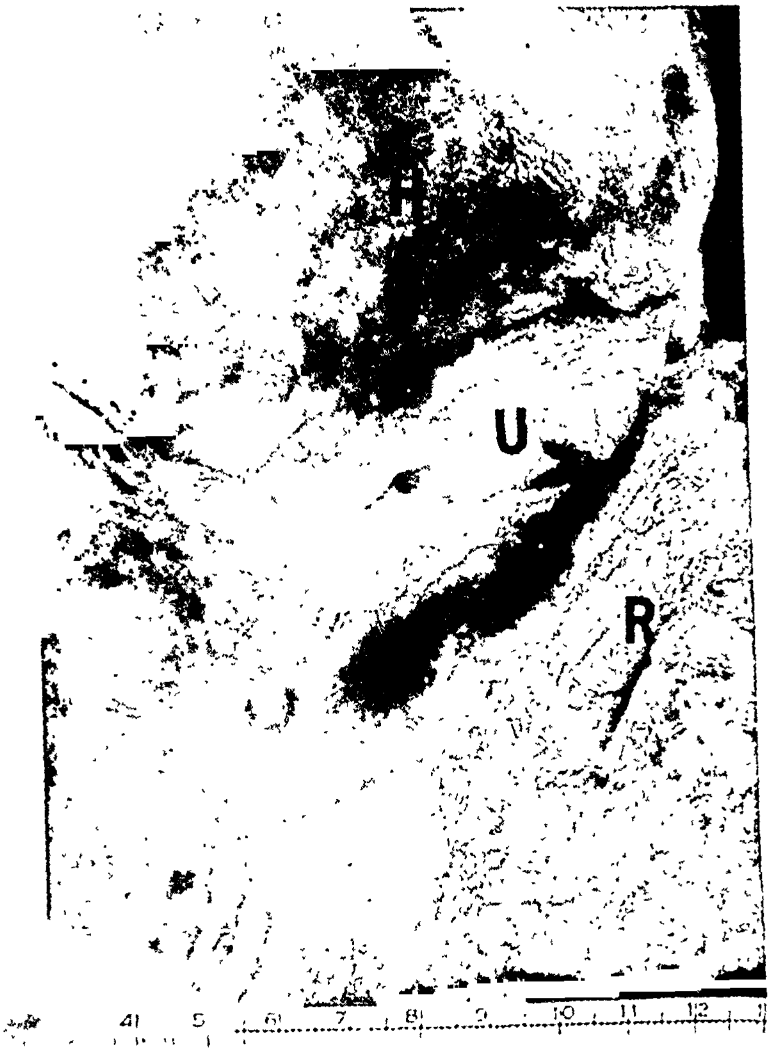
This patient was hospitalized for the first time in November, 1943, at the age of 75, with the complaints of dysphagia, a burning sensation in the xiphoid region, and pain radiating through to the back. Esophagoscopy showed narrowing 35 cm. from the upper incisor teeth that required dilatation with Jackson wax bougies. After dilatation, a 36 F. or 12-mm. esophagoscope was passed beyond the stenosis, and an ulceration covered with a whitish membrane was visualized immediately distal to the site of narrowing. At the distal margin of the ulceration, thickened nodular mucosa was seen and gastric rugae were identified. A biopsy specimen taken from the margin of the ulceration was reported as showing "unusually large cardiac glands with so-called erosion of the esophagus." The surface epithelium was highly cylindrical, mucus-producing, and had papillary folds and contained a broad layer of narrow glands lined by the same type of epithelium. Parietal cells could be recognized within these glands. Several areas were edematous and inflamed. After esophagoscopy, the patient was placed on therapy for ulcers, including anticholinergic medication. Dilatation was repeated in April, 1944. In June, 1944, esophagoscopy was repeated because of severe pain radiating to the back. A narrowing with a granular surface was again seen 35 cm. from the incisor teeth. Biopsy showed a picture similar to the previous one. Inflammatory changes were more marked and the surface epithelium more papillary.

For the next four years, dysphagia was controlled by the occasional passage of a Hurst mercury-weighted tube, 36 F., and by an ulcer regimen. Esophagoscopy was repeated in April, 1948, because of intense epigastric pain, dysphagia, and regurgitation of food. In contrast to the findings four years previously, when the narrowing was encountered 35 cm. from the incisor teeth, stenosis was met on this occasion at 30 cm. Proximal to

---

From the Department of Otolaryngology, Beth Israel Hospital, and the Department of Radiology, Mount Sinai Hospital.

the stenosis, there were severe inflammatory changes in the esophageal epithelium. The stenosis was dilatated, and the esophagoscope passed beyond it into the stomach, identified by the presence of rugae. Biopsy from the stenotic area showed inflamed gastric tissue. During the next year, dysphagia and pain persisted and there were several episodes of tarry stools. Transfusions were required because of marked anemia, with a hemoglobin level of 4.5 gm. per 100 cc. In May, 1949, esophagoscopy



ig. 1—Photograph of gross specimen. "U" marks closed-off perforated
icer immediately proximal to cardia. "R" indicates gastric rugae of
herniated portion of stomach. "H" indicates 5-cm. segment of esophagus
proximal to cardia, which was intensely reddened, eroded, and edematous
and on microscopy showed remnants of glandular epithelium. Portion of
esophagus at top was somewhat yellowish in color, also eroded, but
showed no evidence of glandular epithelium microscopically.

showed stenosis at 30 cm., with a granular surface below which there was a rather discrete ulceration on the posterior wall. Dilatation was possible only up to a 30 F. bougie. Biopsy again showed inflamed gastric tissue only. Feeding was done for 12 days through a nasogastric tube.

Seven months later, in February, 1950, because of recurrence of dysphagia and pain, esophagoscopy was done again. At 26 cm. from the incisor teeth, an ulcerated area was visualized beyond which there was a stricture 2 or 3 mm. in diameter. Dilatation to 30 F. was possible. A biopsy specimen taken proximal to the stricture showed inflamed cardiac glands. Esophagoscopy with dilatation was repeated in June, 1950, with similar findings. Esophagoscopy was done four times in the interval from March, 1951, to September, 1954, for relief of recurrent symptoms. On each occasion, stenosis at about 27 cm. from the incisor teeth was found. In 1953, a superficial ulceration covered with a whitish membrane, about 2 cm. in length, was seen proximal to the stricture. A biopsy specimen from the ulcerated area showed tissue containing peptic glands with subacute inflammation and erosion. On this occasion, it was noted that there was free reflux of acid gastric juice from the stomach into the esophagus.

In May, 1955, the patient required laparotomy for intestinal [illegible] Carcinomatosis due to a colonic carcinoma was [illegible] The patient died shortly thereafter. Postmortem examina[illegible] [illegible] the presence of a hiatus hernia (fig. 1). The junction of the tubular esophagus with the saccular stomach, i. e., the cardia, was abrupt and easily identified. Immediately proximal to this junction, a deep oval ulcer crater was found. The base of this crater was formed by fibrotic mediastinal tissue containing anthracotic lymph nodes. Around and proximal to the ulcer for a distance of 5 cm., the lining of the esophagus was intensely reddened and edematous. Proximal to this segment, the surface showed a yellowish color with a fairly abrupt line of demarcation from the intensely reddened area below. Microscopic examination (fig. 2) demonstrated that the mucosa in the 5-cm. segment of the most distal esophagus was diffusely eroded, with residual glandular or gastric epithelium. There was marked cellular infiltration and evidence of both acute and chronic inflammation. The epithelium proximal to this segment was also eroded but, in contrast to the findings in the more distal segment, showed no evidence of residual glands along the inflamed surface. Squamous epithelium was seen only in the uppermost portion of the esophagus.

Roentgen observations of the esophagus were made on several occasions. In 1944, a hiatus hernia with short esophagus was seen with a relatively narrowed, short transitional, probably ulcerated segment in the distal esophagus. The esophagus per se also appeared somewhat limited in distensibility and showed indistinct, irregular contours. In 1948 (fig. 3*A*), the hernia appeared more elongated, and a deep, pseudodiverticular ulcer crater was present a short distance above the hernial sac. A short, markedly narrowed segment was present below the crater, and a longer segment of limited distensibility with irregular mucosal pattern was present proximal to the crater. The esophagus more proximally was moderately dilated. In 1953 (fig. 3*B*), the hernial sac was more globular. Above it, there was a segment about 4 cm. in length with narrowing at both of its ends.

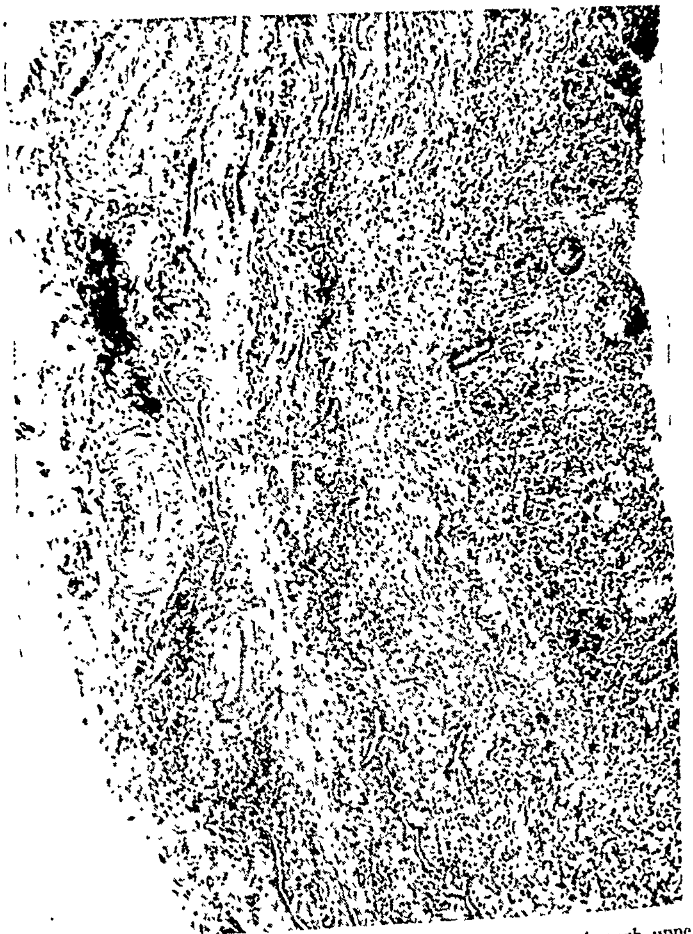


Fig. 2.—Photomicrograph of section of esophagus taken through upper
margin of segment "H" shown in figure 1. Residual gastric epithelium
with remnants of basal portions of tubular glands diminish proximally,
i. e. toward top of figure. Marked cellular infiltration, polymorphonuclear
and round cells, submucosal thickening, and thickening of vessel walls
were present. (Muscular layers stripped off in this section.)

The distal narrowing was short and about one-half the normal caliber. The proximal narrowing was longer, about 1.5 cm. in length, about one-third of the normal caliber, and irregular in contour, suggesting ulceration. The esophagus more proximally was moderately dilated.

Comment

Confusion in terminology has retarded progress in understanding inflammatory and ulcerative diseases of the esophagus.[3] The term gastric-lined esophagus, as used in this report, was suggested by Allison and Johnstone,[2] but Barrett[1] prefers to call the gastric-lined esophagus part of the stomach. Except for the nature of the lining epithelium, however, the gross and microscopic characteristics of the structure in question are those of esophagus. This glandular but atypical epithelium appears to be as susceptible to peptic digestion as esophageal squamous epithelium. The extension of gastric epithelium into the esophagus has also been referred to as heterotopic gastric epithelium.[1] Used in this fashion, heterotopic must be differentiated from "ectopic" gastric epithelium, which refers to isolated, discrete islands of gastric epithelium in the esophagus. Such islands are rare in the distal esophagus. If one considers the part in question stomach rather than esophagus, the congenital anomaly may also be designated as "congenitally short esophagus" or "congenitally short squamous esophagus,"[1] both confusing terms. It is of interest that, while the anomaly is congenital in nature, a chronic peptic ulcer of the esophagus usually does not appear until late in life. It is likely that production of an ulcer also requires the presence of regurgitation of acid gastric juices from the true stomach into the gastric-lined esophagus, i. e., the addition of an acquired sliding type of hiatus hernia with sphincter incompetence. Regurgitation of this type may also be the immediate cause of a diffuse peptic esophagitis of the gastric-lined segment—a Barrett esophagitis. Ulceration within the gastric-lined segment appears to occur preferentially at one or the other end of the segment and may cause severe bleeding as well as stricture formation. It should be noted that the recognition of the gastric nature of the lining epithelium of the distal esophagus may not be possible at esophagoscopy or on gross examination, since rugae may be completely absent. The opposite error may also occur, since the observation of folds resembling rugae within this segment may suggest that the esophagoscope lies within stomach rather than gastric-lined esophagus. This may lead to considerable confusion, e. g., during attempts at subsequent hernial repair or resection. The diagnosis of ulceration in gastric-lined esophagus may occasionally be suggested on the basis of roentgen findings if an intermediate, somewhat tubular structure with narrowing at its summit is demonstrated above a more typical-appearing sliding hernia[3] (fig. 3*B*). If an esophageal ulcer is unusually deep (fig. 3*A*) or located unusually high, the same suspicion should be entertained.

It is of interest that the esophagoscopic findings in the case reported may be interpreted as indicating progressive shortening of the esophagus in the interval from 1943 to 1945. It is uncertain, however, that the stricture found at each esophagoscopy actually represents the same site in the esophagus. It seems likely that shortening of 5 cm. did occur between November, 1943, and April, 1948, since the esophagoscopic notes indicate that gastric rugae were visualized distal to the stricture. It seems unlikely, however, that any remarkable shortening could have occurred after the ulcer proximal to the cardia had penetrated or formed a closed-off local perforation, as found at autopsy and suggested in the roentgen examination of 1948. It is possible that the stricture found at esophagoscopy after 1949, located 26 cm. from the incisor teeth, was a second more proximal stricture in the upper portion of the gastric-lined segment rather than the original stricture located at its distal end. This possibility is also suggested by the roentgen findings in 1953, which demonstrate two narrow segments. Incidentally, these findings as well as the findings at autopsy indicate that the case described is not an example of so-called ascending fibrosis of the esophagus, which occurs as a result of chronic peptic esophagitis in a normal or squamous-lined esophagus.

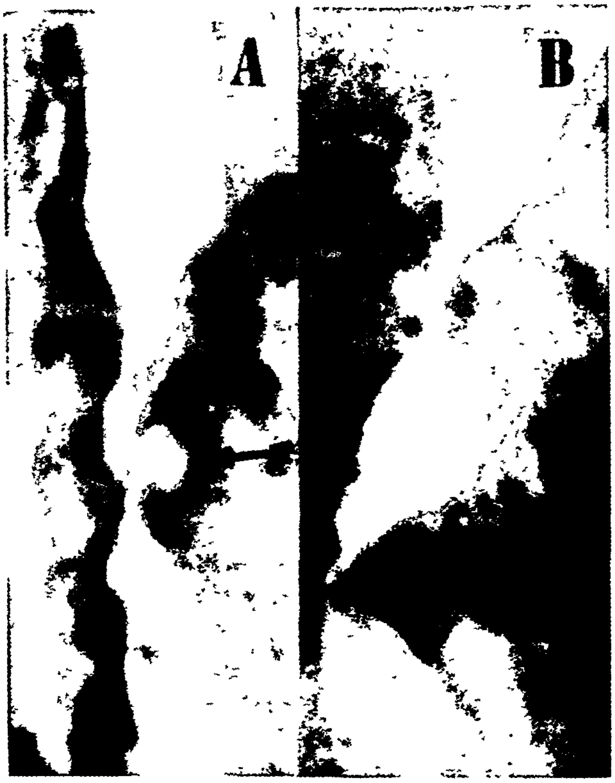

Fig. 3.—*A*, film taken in 1948, showing deep, pseudodiverticular ulcer crater (arrow) with short, markedly narrowed segment distally at apex of hernial sac. Proximal to the crater, esophagus is narrowed over longer segment, with funneling toward moderately dilated esophagus more proximally. The mucosal pattern in this narrowed segment was very irregular. Hernial sac may be somewhat longer than in 1944. *B*, film taken in 1953, showing hernial sac to have a globular configuration. Above it is a short, somewhat tubular, 4-cm. distensible segment, narrowed at both ends. *Distal* end (arrow) is presumed to be region of cardia at which, in 1944, a deep crater was filled. Narrowing at proximal end is about 1.5 cm. in length and irregular in contour, suggesting diffuse ulceration. Combination of typical sliding hernia and relatively tubular segment above it with narrowing at its summit—a double-sac appearance—is highly suggestive of gastric-lined esophagus with ulceration

Summary

It is now recognized that a predisposing cause of chronic peptic ulcer of the esophagus is a congenital anomaly of the epithelium lining the distal esophagus, namely, gastric-lined esophagus. In this anomaly, the lining epithelium over a variable distance is of an atypical gastric type rather than the usual squamous variety. This condition has also been called heterotopic gastric epithelium or a variety of congenitally short esophagus. Except for the epithelium, however, the other characteristics of the viscus in question are esophageal. A case is reported of this anomaly that illustrates the characteristic inflammatory complications, i. e., peptic ulcer and esophagitis of the gastric-lined segment, in association with an acquired hiatus hernia.

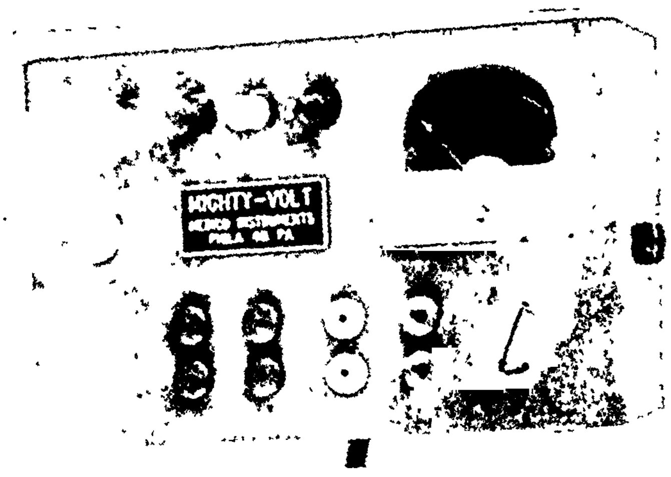
A MULTIPURPOSE TRANSFORMER UNIT

Samuel I. Askovitz, M.D.
and
Elmer L. Offenbacher, Ph.D., Philadelphia

Some manufacturers and distributors of diagnostic instruments would lead physicians to believe that each new electrical device requires its own specially designed voltage adapter or transformer. However, since most hand instruments operate on 1.5 to 12 volts and draw a current of from 0.2 to 2.5 amp., it seemed quite feasible to construct a single low-voltage supply that could serve all of the instruments the average practitioner might use in his office. The valuable features of a small portable transformer developed recently[1] have been combined with a number of new improvements, in order to provide a maximum of convenience and safety.



Multipurpose transformer unit.

The final unit is shown in the figure. Four sets of outlets are provided on the front panel, two pairs with an output of 3 volts or less, one pair for 6-volt instruments, and one pair for 12 volts. The outlet jacks are color-coded green, yellow, and red, respectively, in accordance with customary conventions. The limiting of the voltage at each pair of outlets minimizes the likelihood of instrument bulbs accidentally burning out. (The use of colored cord tips to match the recommended voltage of the instrument would be a further protection against connecting to incorrect outlets.) Two voltage-regulating rheostats are provided, the left-hand one for the two sets of green outlets and the right-hand knob to control the remaining front-panel outlets.

The push-button switch system was selected as a timesaving convenience. In order to turn on any of the four instruments attached to the front panel, one need merely push in the correspondingly colored push button above. This will put on the desired instrument and, at the same time, shut off any instrument previously in operation; also, it will turn on the pilot light, connect the meter to the outlets in use (to provide a continuous indication of the voltage being supplied to the instrument), and, in addition, turn on the small lamp illuminating the meter from within.

An accessory set of 2.5-volt outlets has been provided on the right-hand side of the unit, for those instruments that have their own rheostat on the handle. A bulb-testing socket is included with the unit for rapid testing of instrument or flashlight bulbs. Although a voltmeter is not essential to a transformer unit, it is desirable for several reasons: The voltage for any instrument may thereby be set at the optimum level (i. e., high enough to give proper brightness to the bulb, and yet not so high as to shorten the life of the bulb), and it allows one to set the voltage independently of variations in the local power supply. It is advisable to check the various voltage outlets periodically and to adjust the rheostats accordingly.

The basic two-coil transformer has the low-voltage outlets electrically separate from the incoming 110 volts, and the insulation has been found to withstand an applied potential of 2,000 volts safely. An internal fuse serves to prevent output overload above 3 amp. The instrument has not been submitted to Underwriters' Laboratories.

4900 N. Ninth St. (41) (Dr. Askovitz).

The transformer unit described was built, according to the authors' specifications, by Medico Instruments, Philadelphia 20.

Test to Demonstrate Amount of Antibody.—The amount of antibody in a serum may be demonstrated *in several* ways. The simplest technic is to make serial dilutions of antiserum to each of which is added a given amount of antigen. An end point or titer is indicated by the last dilution in which agglutination occurs in the case of a particulate antigen or in which precipitation occurs with soluble antigens. Wu and Heidelberger have developed quantitative technics for the measurement of precipitable or agglutinable antibody. Another method to visualize interactions between antigen and antibody is precipitation in a semi-solid medium, generally agar or gelatin. This test is capable of showing the pressures of more than one antigen-antibody system. A visible and discrete opaque band which migrates through the agar or gelatin is indicative of the reaction between components of at least one system. The presence of more than one band indicates the presence of more than one antigen-antibody system.—William J. Kuhns. FACIAL NERVE PARALYSIS AFTER GENERAL ANESTHESIA

Jim E. Fuller, M.D.
and
D. Vernon Thomas, M.B., Rochester, N. Y.

Attention has frequently been drawn to the danger that exists of producing damage to peripheral nerves in the unconscious patient by stretching or by pressure.[1] Paralysis caused in this way has been reported involving the brachial plexus, the radial nerve, the ulnar nerve, and the superficial peroneal nerve. While a total of six cases of involvement of the facial nerve has been noted in Russia and in Germany,[2] the American and British literature appears to be devoid of reference to such a condition. For this reason it is felt that the following cases are of interest.

Report of Cases

CASE 1.—A 54-year-old woman was undergoing cholecystectomy; she was moderately obese and her neck was short. During the induction of nitrous oxide–oxygen–ether anesthesia, upper respiratory obstruction developed, presumably as the result of the tongue's falling back against the posterior pharyngeal wall. This was only partly corrected by insertion of a rubber oral airway, but it was fully relieved when the lower jaw was lifted forward by bilateral digital pressure applied behind the angles of the mandible. Thirty minutes after the beginning of anesthesia, an endotracheal tube was passed. When the patient recovered consciousness she was noticed to have a weakness of the left corner of the mouth, involving both the upper and the lower lips, and there was flaccidity of the left cheek. Control of food during chewing was impaired, and there was a definite asymmetry of the face. The disability gradually lessened, and after three months full function had returned.

CASE 2.—A 53-year-old man was being operated upon for inguinal herniorrhaphy; he was of heavy build and had a thick, short neck. Early in the induction of anesthesia with nitrous oxide, oxygen, and ether, obstruction of respiration at the pharyngeal level occurred. Because placement of a rubber oral airway failed to relieve the condition completely, forward digital pressure was applied behind the mandibular angles, and breathing was thereby improved. Ten minutes later laryngoscopy and intubation of the trachea were accomplished. The next day, while shaving, the patient noticed that when he opened his mouth the right corner became pulled toward the midline. On cursory inspection it was almost impossible to notice any defect, both speech and eating being normal. However, on careful examination a weakness of the right half of the lower lip was easily detected. Recovery was complete in three weeks.

Comment

In view of the fact that pharyngeal respiratory obstruction is a very common occurrence during anesthesia and that pressure behind the mandible is frequently employed to relieve it, it is surprising that the facial nerve is not more often damaged. The minor degree of weakness exhibited by our second patient suggests that it is not unlikely that minor paralyses go unnoticed by both the patient and his doctors. Furthermore, there is considerable variation in the branching and the course of the nerve,[3] and this may explain why it is rarely injured in this way.

The facial nerve leaves the skull by the stylomastoid foramen, whence it passes forward and outward to become superficial to the ramus of the mandible and enters the substance of the parotid gland. Here it divides into its branches, which proceed forward to supply the facial muscles. While the temporal and zygomatic branches incline upward, the buccal and (more especially) the mandibular branches turn downward, running over or behind the ramus of the mandible, and are therefore more susceptible to injury by pressure applied in this area. In addition to damage from direct pressure, it is possible that strong forward traction on the mandible may transmit a stretching force to the nerve or its branches.

Lisitsyn,[2a] who studied 20 dissections of the facial nerve, noted that anatomic variation occurred in three pertinent areas. 1. The facial nerve may have a trunk of varying length between the stylomastoid foramen and the point where it begins to branch and enter the parotid gland. It may give off its branches at different levels, either just as it emerges from the parotid gland or somewhat farther down. 2. The nerve has a variable relationship to the parotid gland, being either deep to it and covered by the gland, so that pressure injury is unlikely, or else lying superficially in the substance of the gland itself. 3. The mandibular branch (ramus marginalis mandibulae) has an inconstant relationship to the angle of the mandible. Usually it runs high, and no matter how far the jaw is pushed forward it is not brought to lie on the edge of the angle of the mandible. However, in some cases the mandibular branch occupies a low position and bends around the edge of the angle of the jaw so that any pressure applied in this area would compress the nerve branch against the bone.

While both the patients recovered in a relatively short time, return of function might have been considerably delayed had retromandibular pressure been maintained for several hours. One of the patients reported by Zäbisch [2b] recovered full function only after six months. This condition should be considered in the differential diagnosis of postoperative cerebrovascular accidents. Polovinkova [2c] records a case in which the neurologist made an erroneous diagnosis of hemiplegia due to cerebral embolism.

Summary

Two patients had partial facial paralysis after general anesthesia. This emphasizes the need for early tracheal intubation in patients whose airway can only be maintained by strong pressure applied to the lower jaw. These appear to be the first such cases reported in the English-language literature.

SPECIAL ARTICLE

MEDICAL AUDITING BY SCIENTIFIC METHODS

ILLUSTRATED BY MAJOR FEMALE PELVIC SURGERY

Paul A. Lembcke, M.P.H., M.D., Baltimore

The purpose of this article is to introduce scientific methods of medical auditing that can be used with common understanding by hospitals and doctors whose work is to be audited and by persons or agencies making audits. Methods for abstracting and classifying cases, criteria by which individual cases can be judged, and standards by which satisfactory performance can be measured are described and illustrated by actual experience. In the interest of brevity, the descriptions have been limited to a few kinds of female pelvic surgery, but similar methods for auditing other surgical operations and the diagnosis and treatment of various diseases will be described elsewhere.

Medical audit is defined as the evaluation of medical care in retrospect through analysis of clinical records. It does not relieve the hospital staff of the daily necessity of supervising, educating, and assisting its members in providing good professional care; in fact, by its exposure of shortcomings it emphasizes the need to control the quality of care at the time it is given. Although the principles and general methods are the same in both instances, it is desirable to distinguish between the internal audit, which should be carried on continuously by the hospital staff and which consists of the process of abstracting and classifying clinical records and evaluating the quality of medical care in individual cases, and an external audit, in which case an outside agency periodically tests the completeness and accuracy of the internal audit. In endorsing the idea of external audits by the Joint Commission on Accreditation of Hospitals, the San Francisco Medical Society noted a similarity between the functions of the commission's medical inspectors and the examiners of a banking authority, adding that: "The periodic visit of a bank examiner does not disturb the bank with its affairs in order."[1]

Historical Development

The medical audit has reached its present state of development through a long evolutionary process.[2] In the early stages the leaders in medicine and education tried to cope with the problems of commercialism and a general lack of medical skill through the then limited resources of the Council on Medical Education of the American Medical Association and the Association of American Medical Colleges. The basic fault in the early 1900's was that a majority of the 165 medical schools were profiteering enterprises that accepted poorly prepared students who often did not have even a high school education and that, after 24 or 30 months of lectures and cramming, poured 5,200 new doctors a year into a profession already overcrowded. The outstanding event in the drive for improvement was Abraham Flexner's famous survey for the Carnegie Foundation,[3] which played the major role in shifting medical education from diploma mills to universities and in reducing by one-half the number of medical schools and the ratio of graduates to the population.

The substantial reforms that immediately followed Flexner's survey influenced the leaders in surgery, where commercialism and lack of skill seemed more obvious and more damaging than in other branches of medicine, to hope that a similar survey would reform the hospitals and clean up surgical practice. This led first to the formation of the American College of Surgeons, which was "to elevate the standards of the profession, moral as well as intellectual, to foster research, and to educate the public up to the idea that there is a difference between the honest, conscientious, well-trained surgeon and the purely commercial operator."[4] It was thought originally that a study like Flexner's applied to hospitals would influence some great foundation to give financial support to hospital reform as the Rockefeller Foundation had given to improve the medical schools, but, whereas by 1910 Flexner had to survey only 155 schools, in 1919 there were 700 hospitals with over 100 beds and 2,000 of 25-to-99-bed capacity. Further, the Carnegie Foundation itself did not see fit to undertake the survey. It made grants of $30,000 in 1916 and $75,000 in 1920 to the American College of Surgeons for this purpose, but from that time until 1952 the cost of the hospital reform movement was paid by the surgeons.

The "hospital standardization program," as it was called, started with the intention of auditing professional care by the individual case method,[5] but it soon appeared that its resources were insufficient for the intensive program that would be necessary to develop the methods and provide the service for medical audits of the hospitals of North America, and its scope was limited accordingly to five manageable and basic aspects, namely: (1) medical staff organization, (2) qualifications for medical staff membership, (3) rules and policies governing professional work in the hospital, (4) medical records, and (5) diagnostic and therapeutic facilities.[6] These are factors without which it would be difficult to do good work but which of themselves do not necessarily insure good medical care.

In spite of its limitations, a great deal of good was accomplished by the hospital standardization program of the American College of Surgeons. At the same time, the development of the internship and residency approval programs of the American Medical Association, the development of the medical specialty boards, and the ventures in postgraduate education by the Bingham Associates Fund, the Commonwealth Fund, and a number of universities and professional organizations have contributed heavily to the betterment of hospitals and hospital care. When these activities are added to the improvements that have taken place in undergraduate medical education and the advances in medical

---

Associate Professor, Johns Hopkins University, School of Hygiene and Public Health, Division of Hospital Administration.

science resulting from basic and medical research, the accomplishments to date are most impressive. However, there is always need to be certain that these efforts are successful in transmitting to patients the almost miraculous benefits of modern medical knowledge; such is the purpose of the medical audit.

Over the years there has been a search for a few indexes that could be easily gleaned from hospital statistics and that would be reliable indications of the quality of medical care in hospital. For a time it seemed that total death rates, or those related to length of stay in hospital or to operations and anesthesia and type of case; figures on the percentage of normal tissue removed; or the agreement between preoperative and postoperative diagnoses might be useful. Indexes of this kind had been pioneered in earlier years by MacEachern at Vancouver (B. C.) General, Dillon at St. Vincent's in Los Angeles, Chapman at Cleveland's Mount Sinai Hospital, and, especially, Ward at Woman's Hospital, New York, and were being used until recently by Ponton, Klicka, and others.[2]

In 1946, I attempted to determine from similar indexes developed by the Commonwealth Fund staff[7] whether, and to what extent, the postgraduate medical education and advisory programs of the Council of Rochester Regional Hospitals were improving hospital and medical care in 18 member hospitals.[8] Special forms were prepared, a medical records manual was written, committees and study groups were organized to guide and forward the work, and a medical record librarian was employed to assist the hospitals in furnishing accurate and comparable data. The program attracted the attention of the Kellogg Foundation, which in 1949 adopted it with minor revisions for use by the Southwestern Michigan Hospital Council. Although the Council of Rochester Regional Hospitals has continued the original plan down to the present time, it was apparent as early as 1948 that the "Reports of Professional Activities," as these indexes were called, did not provide satisfactory answers. The various death rates were virtually meaningless because of variations in the proportion of different types of diseases and operations. There was no definite or constant relationship between death rates and the proportion of patients having reasonably complete records of history, physical examination, laboratory diagnosis, and consultation, the reason being that points important in some diseases were being obscured by lumping them with diseases in which such points were insignificant. Further, hospital care is undertaken only occasionally with the aim of preventing immediate death—hospital death rates rarely exceed 4%, regardless of the quality of care—whereas a majority of patients are being treated with such other aims as restoring function, preventing disability, or relieving pain.

Laboratory data on the percentage of normal tissue removed were not satisfactory, because pathology reports too often described essentially normal organs with euphemisms or anatomic terms that could be construed to disguise the fact. On the other hand, the figures usually failed to distinguish normal organs the removal of which was justified, such as a prolapsed uterus in an older woman or an appendix removed in the course of cholecystectomy. Another source of error or confusion was that not a few surgeons postponed making a written record of their preoperative observations, including at times even history and physical examination, until after the operation, in which case some of them perhaps inadvertently made the preoperative diagnosis correspond to the postoperative diagnosis or even to the pathology report.

Such anomalies were so frequent that, in a study undertaken in 1949 to discover what proportion of appendectomies done to relieve symptoms attributed to disease of the appendix were justified, I felt that if figures were to be comparable between one hospital and another it would be necessary to disregard the clinical diagnosis and pathology report and to use the mere fact of the primary appendectomy as an index. By this method, operations done in hospitals in and around a well-defined geographical area for which the population is known, but only those done on persons whose usual residence is in such area, are counted and the results expressed as "hospital area" incidence rates per 1,000 population resident in the area.[9] Although such rates do not permit comparison of one hospital with another where there are two or more in the community, nor evaluation of the work of individual physicians, they are very useful in checking the general reliability of hospital data obtained by individual case analysis, as well as in comparing one community with another.

When it came to analyzing individual cases, I concluded,[10] as did Myers[11] and Eisele,[12] that most of the indexes of quality used in the past are now out of date or otherwise erroneous because of a lack of research in this field, possibly attributable to undue emphasis on secrecy in the past when medical audits were made only for cause, where there was good reason to suspect that all was not well.

Current Methods

The situation has improved since the advent of the Joint Commission on Accreditation of Hospitals, whose inspections routinely include as much of an audit as is possible in the circumstances, although this phase of hospital accreditation is still greatly handicapped by the fact that few hospitals maintain an internal audit. There is rarely an opportunity for the commission's inspectors to do an external audit, i. e., to test the completeness and accuracy of a hospital's internal audit. Instead, they must deal directly with the clinical records, a time-consuming process that severely restricts the scope and depth of their audit. Another problem is that there are few objective criteria to guide the inspectors, who would need to be expert in all fields if their individual subjective opinions were to be accepted as authoritative.

When the shortcomings of the "Reports of Professional Activities" became apparent to them, the Southwestern Michigan Hospital Council group first experimented with individual audits by Dr. Wesley C. Eisele and later joined with the American College of Surgeons in developing a method whereby the hospital's medical record librarian prepares uniform abstracts of all records on forms that are sent to a statistical center for transfer to punch cards and sorting by machine to give a statistical analysis that will indicate what kinds of cases or what phases of patient care should be selected by the audit committee of the medical staff for their deliberations. Their analysis is in turn recorded on special sheets for machine processing.[13] It appears that under this plan each audit committee makes up its own criteria, which in these circumstances might vary considerably from those of inspectors for the Joint Commission on Accreditation of Hospitals, from those employed in other hospitals, from those used in different periods in the same hospital, and even from those used for similar cases considered by the same audit committee. For example, in the table on surgical performance statistics in appendectomy, it is inconsistent for hospital 5 to have about 88% of appendectomies justified when some 28% of the tissue removed was normal, or for hospitals 3 and 4 to have the same percentage of cases justified when hospital 3 has about 13% but hospital 4 has only 5% removal of normal tissue. In the same table hospitals 6 and 7 are represented as having virtually no normal tissue removed, a finding that I question since I have never encountered a figure lower than 17% in the best hospitals.

In developing the methodology that I am introducing here, I have attempted to avoid inconsistencies and have aimed to be scientific by employing written definitions, written criteria for justifying or criticizing specific actions, tests of the accuracy of pathology reports, and a comparison of the results obtained with standards derived from observations in control hospitals. These procedures can be used in conjunction with the clinical records as such or with any suitable method of abstracting the essential points. Unfortunately, the previously described abstracts for machine tabulation[13] would have to be changed somewhat to be used with the methods I propose because, with few exceptions, they merely indicate that a certain observation was made and do not state the result. For example, in pneumonia the statistical analysis shows whether chest x-ray examination was made but does not indicate the result and in appendectomy cases neither the white blood cell count nor the tissue diagnosis would be entered. Any system of abstracting an entire record indiscriminately is likely to be either too complicated or insufficiently informative. It is better to decide in advance for specific diseases or operations what data are necessary for evaluation and to limit the abstract accordingly.

Scope of Medical Audit

The medical care of a hospitalized patient usually presents a number of diagnostic and therapeutic features, some important and others relatively insignificant. One of the problems in establishing a procedure for the medical audit of a given disease or operation is to single out and concentrate on a few features that are essential to achievement of the desired end-result of hospital care. For example, a routine chest x-ray, important as it may be to the detection of unsuspected pulmonary and cardiac disease, would not be germane in the audit of a hysterectomy. The scope of the medical audit may be limited further by a lack of scientific knowledge on which criteria can be based. For example, our present state of knowledge may permit us to judge whether the precautions taken to avoid death or complications incidental to tonsillectomy were adequate, but we do not know enough to judge the larger issue of whether the operation should have been done at all. If more than one feature is essential to the proper management of a case, it is usually necessary to judge each one separately; e. g., a subtotal hysterectomy might be justified as to necessity by a pathology report of fibromyomas and criticized because the cervix was not removed or because biopsy of the cervix was not done.

Main Features of the Audit

The main features of the medical audit that have been found necessary and feasible include those listed below.

1. Arranging data into meaningful classifications; e. g., classifying major female pelvic surgery according to whether it may result in sterility or castration.
2. Verifying the statements in the clinical record by means of written confirmation, such as
   a. reports of pathology or x-ray departments, clinical laboratory, or electrocardiographic examination;
   b. report of a qualified consultant;
   c. observations made by another hospital, laboratory, or outside consultant;
   d. statement signed by the patient or proper representative, e. g., in sterilization cases; and
   e. nurses' notes, chiefly in respect to medicines and treatments.
3. *Establishing the accuracy of tissue diagnosis,* x-ray, and electrocardiographic and clinical laboratory examinations by submitting representative slides, films, etc., to other laboratories for independent interpretations.
4. *Comparing the verifiable facts with criteria established as being necessary or important in*
   a. confirming the clinical diagnosis, e. g., result of electrocardiogram in the diagnosis of myocardial infarction;
   b. justifying surgical operations as to their necessity, e. g., pathology report in primary oophorectomy;
   c. classifying surgical operations as to the proper extent, e. g., exploration of common bile duct in cholecystectomy patients with jaundice;
   d. providing proper chemotherapy, e. g., penicillin in acute rheumatic fever;
   e. determining whether hospitalization was necessary at all;
   f. judging whether death may have been preventable;
   g. justifying the length of stay in hospital;
   h. evaluating the safeguards employed in blood transfusion; and
   i. other aspects of generally similar character.
5. Comparing the degree of compliance with criteria, as measured by the methods described above, with a standard degree of compliance found to be characteristic of hospitals of acknowledged merit.

In addition to these five features, I have found it very useful to compute incidence rates for the community served by the hospital.

Development of Criteria

In developing criteria for evaluating the care of hospitalized patients, certain principles were observed that are believed to be generally applicable regardless of the type of case.

1. *Objectivity.*—Criteria should be stated in writing with sufficient precision and detail to make them relatively immune to varying interpretations by different individuals.
2. *Verifiability.*—Criteria should be so framed that points on which they rest can be verified by laboratory examination, consultation, or documentation.
3. *Uniformity.*—In view of the essential uniformity of the human body and its diseases, criteria should be independent of such factors as size or location of hospital, qualifications of the physician, or social and economic status of patient.

4. *Specificity.*—Criteria should be specific for each kind of disease or operation to be evaluated, and all significant and closely related diseases or operations in the same patient should be considered as a unit.

5. *Pertinence.*—To the greatest extent possible, criteria should be pertinent to the ultimate aim of the medical care being evaluated, and they should be based on results rather than intentions (The latter point was commented on early in the history of hospital and surgical practice reform as "the tragedy of the man who has the best intentions and the best character and a fair equipment for his work, but who has not a thorough equipment, and who cannot do the thing he starts to do in the best possible way."[14])

6. *Acceptability.*—Criteria should conform with generally accepted standards of good quality as set forth in leading textbooks and articles based on scientific study.

The first step in developing criteria has been the preparation of written definitions and rules from the information available in the current medical literature. Considerable emphasis has been placed on textbooks as expressing conservative medical opinion generally representative of the theory and practice accepted by a majority of competent physicians. Where they are available, articles based on research bearing directly on the medical audit have been used, e. g., Doyle's articles on unnecessary oophorectomies and hysterectomies.[15] Additional steps have consisted of testing the criteria on several hundred cases to find out whether the necessary data are or can be recorded regularly, to learn whether compliance is feasible, and to judge the effect of the criteria on such important objectives as discovery of cancer or reduction in mortality.

The sources consulted on female pelvic surgery included textbooks by Te Linde,[16] the Novaks,[17] Lowrie,[18] Curtis and Huffman,[19] and Wharton.[20] More weight was given to Doyle's comprehensive and pointed articles on unnecessary oophorectomies and unnecessary hysterectomies [15] than to any other single source, since his studies were directed toward the development of criteria. Useful material was found in many other places, also, such as in the work of Reich,[21] Abel,[22] and Novak [23] and in other articles of general educational intent.[24] The occurrence of uterine and ovarian cancer, estimated by Randall, Gerhardt, and others,[25] and of coronary disease in women who have had oophorectomies, estimated by Katz, Pick, and Stamler,[26] was considered also.

TABLE 1.—*Classification of Female Pelvic Operations*

1 Hysterectomy with castrating oophorectomy (both ovaries or only remaining ovary removed)
2 Castrating oophorectomy without hysterectomy
3 Hysterectomy with noncastrating oophorectomy (one ovary removed; all or part of other ovary remains)
4 Sterilizing tubal surgery with noncastrating oophorectomy
5 Hysterectomy without oophorectomy (ovary or ovaries, if present, left intact or subjected to no more than biopsy or partial resection)
6 Sterilizing tubal surgery without oophorectomy (ligation, sclerosis, section, and partial or total excision of one or both tubes so that there is no communication between uterus and ovary)
7 Radiation therapy
8 Myomectomy (abdominal route only)
9 Hysterotomy (cesarean section excluded)
10 Noncastrating oophorectomy without hysterectomy or sterilizing tubal surgery
11 Nonsterilizing tubal surgery without oophorectomy
12 Plastic tubal surgery (anatomic communication between uterus and ovary preserved by salpingotomy or reestablished by plastic operation)
13 Uterine suspension
14 Exploratory laparotomy for suspected female pelvic disease (includes partial ovarian resection)
15 Pelvic repair (not associated with hysterectomy or uterine suspension)
16 Uterine curettage
17. Dilatation of cervix (except in conjunction with uterine curettage, cervical operation, or Rubin's test)
18 Cauterization of cervix (except in conjunction with conization or excision of local lesion, excision of stump, or amputation of cervix)
19 Cervical biopsy, conization, or excision of local lesion
20 Total excision of cervix (includes amputation)
21 Completion of incomplete abortion (includes removal of retained secundines following delivery at term)
22 Therapeutic abortion
23 First cesarean section
24 Repeat cesarean section

Integration of Multiple Operations

The problem of multiple operations arises in a large proportion of cases of female pelvic surgery. Some of these operations, oophorectomy and homolateral salpingectomy, for example, are clearly related and can be considered as a unit, but other combinations, such as uterine suspension and oophorectomy, require special classification. To deal with this problem operations have been grouped as shown in table 1, under headings that have been found meaningful in the medical audit. In making these groupings, considerable weight was given to the fact that unnecessary surgery is a big factor in this field and leading roles were assigned to operations resulting in castration or sterilization. Each operation or operation group has been classified in detail in appendix A. The description of hysterectomy given below is an example of the degree of detail needed for precise classification by medical record librarians or clerks to whom this task may be entrusted.

TABLE 2.—*Consultation and Documentation Requirements in Female Pelvic Surgery*

Consultation	Documentation	Description of Primary Operation
Yes*	...	Hysterectomy for uterine descensus
Yes	Yes	Hysterectomy for sterilization
...	Yes	Castrating oophorectomy for breast cancer
Yes	Yes	Tubal surgery for sterilization
..	Yes	Plastic repair of fallopian tubes to relieve sterility
Yes	..	Uterine suspension for significant pelvic relaxation or relief of sterility
...	Yes	Hysterectomy for previously diagnosed and treated cancer of uterus, ovary, or tube

---

* In premenopausal patients aged 35 through 49 yr Hysterectomy for uterine descensus under age 35 is not considered justified, regardless of consultation, unless patient has been previously sterilized or the case has been documented as for sterilization

HYSTERECTOMY. Not analyzed separately if concurrent with cesarean section. According to whether oophorectomy was done, hysterectomies fall into the following main groups.

Group 1. Hysterectomy with castrating oophorectomy (both ovaries or only remaining ovary removed).

Group 3. Hysterectomy with noncastrating oophorectomy (one ovary removed; all or part of other ovary remained).

Group 5. Hysterectomy without oophorectomy (ovary or ovaries, if present, left intact or subjected to no more than biopsy or partial resection).

Tubal surgery, exploratory laparotomy, partial ovarian resection, pelvic repair, uterine curettage, cervical operation in total hysterectomy, and appendectomy are analyzed as part of the hysterectomy.

Operations analyzed separately although done concurrently are cervical operation in subtotal hysterectomy and completion of incomplete abortion.

Consultation and Documentation

Many kinds of operation can be judged as to necessity by preoperative x-ray study or by pathology reports of the presence or absence of disease in the tissues removed, but where diagnosis cannot be made by these means it may be necessary to turn to documentation or consultation. The requirements for [illegible] of female pelvic surgery listed in [illegible] are th[illegible] are generally accepted at the [illegible] ne. H[illegible] from the tone of [illegible] emphasizing [illegible] myoma does not mean that a hysterectomy must be done forthwith,[27] it seems possible or even likely that in the future consultation and the patient's request for sterilization will be required where hysterectomy for nonmalignant disease is contemplated in patients under age 50. Also, if the suspicion that loss of ovarian function increases the risk of fatal coronary disease is borne out,[28] castrating oophorectomy will be undertaken only after a consultant has assisted in appraising the factors for and against castration.

Documentation and consultation in sterilization and therapeutic abortion cases should conform to the laws of the state and, as a rule, should consist of a request signed by the patient and her husband, and the recommendation of two physicians other than the surgeon. *In cases of oophorectomy for palliation of breast cancer or hysterectomy for previously diagnosed cancer of uterus, ovary, or tube, documentation, preferably in the form of a laboratory report, is needed.* Plastic repair of fallopian tubes should be supported by a record of unsuccessful Rubin's tests. Consultation is required if uterine suspension is to be done for pelvic relaxation or attempted relief of sterility. Surgical consultation should include examination of the patient, with a written record of the findings and recommendations of a physician who is himself qualified under the rules of the hospital to perform the contemplated operation.

Justification for Female Pelvic Surgery as to Necessity

In female pelvic surgery the chief problem of the medical audit is to decide whether the operation was justified. Although some operations may be criticized because they are not sufficiently extensive, the usual criticism is that they should not have been done at all or that too much tissue was removed. It should be kept in mind that the medical audit is a retrospective analysis in which the medical auditor is judging events after they have taken place and after such significant information as the pathology report is at hand. For this reason, the criteria are not to be construed as preoperative indications. They may correspond in a degree, perhaps, but they are not appropriate for preoperative use. Also, it should be realized that criteria may change from time to time as medical knowledge and research indicate.

The criteria that apply to operations on the uterus, ovaries, or fallopian tubes that result in castration, sterilization, or both are presented in appendix B. However, the criteria for justified hysterectomy are given as an example.

HYSTERECTOMY. Removal of the uterus is considered justified by the following criteria, provided *that concurrent oophorectomy, if any, is also justified.*

Intrinsic Disease of the Uterus.

1. Malignant neoplasm of corpus uteri, primary or secondary, any stage.
2. Early cancer of cervix, International Classification 0 and 1.
3. Palliative treatment of cancer of cervix, International Classification 2, 3, or 4, following radiation.
4. Chorioepithelioma.
5. Benign neoplasms such as fibromyoma or leiomyoma.
6. Adenomyosis, or endometriosis of the uterus.
7. Rupture.
8. Pyometra.

In the Absence of Uterine Disease.

1. In the course of other justified abdominal operation, when the menopause or age 50 has been reached; or when ovaries or tubes have been removed or so treated that conception is no longer possible.
2. Where necessary to permit adequate resection of malignancy of other organs.
3. Elective sterilization where medical and legal conditions have been fulfilled (may include pelvic relaxation in patients under age 35, or intractable *menorrhagia, etc.*).
4. For relief of significant pelvic relaxations resulting in uterine descensus (*procidentia, prolapse*), cystocele, or rectocele in patients aged 35 or over, or in younger patients who have previously been sterilized artificially.

Not Justified as to Necessity. Some of the common conditions that are at times advanced as reasons for hysterectomy but that are not considered justified for the purposes of the medical audit are chronic cervicitis, pelvic inflammatory disease, fibrosis, endometrial hyperplasia, suspected malignancy, so-called premalignant conditions of cervix or endometrium, endometrial polyp, cervical polyp, lacerated cervix, retroposition of uterus, "clinical" endometriosis.

Standard for Compliance with Criteria. Eighty per cent, considering all hysterectomies together, those with and those without concurrent oophorectomy.

Clinical Judgment.—The criteria have been made as specific as possible, so that various people applying them independently may obtain the same results. Moreover, for the sake of objectivity, without which medical audits can have only limited application and little or no comparability when done at different times or by different persons, the element known as clinical judgment has been subordinated in a certain degree and in a specific way to verifiable facts. For example, in the course of a hysterectomy for uterine bleeding due to fibromyomas in a woman 36 years old, surgeon A might judge that despite his best efforts the blood supply of one of the patient's normal ovaries had been sufficiently impaired to make him fear that if the ovary were left in place it would degenerate and perhaps cause symptoms that would require its removal later on. His clinical judgment would tell him to remove the ovary at the time. However, surgeon B might judge an identical situation differently, believing the ovary would continue to function without symptoms. Surgeon C might be so skillful that this problem would not arise in his surgical management of a similar case. It is impossible on objective grounds to accept the judgment of surgeon A as justifying the oophorectomy. According to objective criteria, the operation would be criticized because the ovary showed no disease.

The element of surgical judgment is recognized by allowing a certain tolerance within which factors of judgment and uncertainty are not criticized. Thus removal of ovaries not showing definite disease will be attributed to surgical technique and clinical judgment in 25% of cases, i. e., compliance with the objective criteria is required in only 75% of noncastrating oophorectomies. This concept of tolerance of a certain percentage of cases not meeting objective criteria has been applied to virtually every operation.

Justification as to Other Aspects

Criteria by which various operations may be evaluated as to completeness and certain diagnostic aspects are set forth in appendix B. An illustration follows.

Hysterectomy is considered complete only if the cervix is also removed, except where consultation before or during operation confirmed the clinical impression that the patient did not present a sufficiently good surgical risk to warrent the complete operation, provided that the presence or absence of cancer in the cervix was established by biopsy. Standard compliance is 90%.

The operations are also analyzed as to whether uterine curettage and cervical biopsy were done at the time of, or in the six months preceding, operation and whether examination under anesthesia was done with, or immediately preceding, operation. Standard compliance is 50% for uterine curettage, 15 for cervical biopsy, and 75 for examination under anesthesia. Each of these aspects is related to the ultimate goal of first-rate surgery, but because each has a different degree of importance they are considered separately.

Methods

Time and money could be saved in medical audits if a sample of records would produce all of the necessary information. However, sampling has not been found adequate, partly because the total number of operations must be divided into a number of small groups that have different criteria for evaluation (there are 24 in the female pelvic operations listed in table 1); partly because audits made at short intervals, quarterly if possible, are most apt to realize the maximum benefit; and finally because the work of each physician needs to be analyzed separately. Therefore, it has been found desirable to analyze every case, even in large, active hospitals. However, in determining "hospital area" or community incidence rates, sampling may be feasible, making it possible to gain a good idea of the situation in large population groups without inordinate cost.

A first step in the medical audit is to insure that few if any records will escape study because they have been held out of the files to be completed, for research, committee action, or any other reason. Therefore, about 200 recent cases should be checked by systematically matching a permanent index or register, preferably a bound volume listing cases chronologically, such as an admission register, against records in the files. For the audit of sterilizing and castrating female pelvic surgery, an up-to-date record such as the operating room book should be used as an index and all records for the types of surgery to be studied should be pulled from the files and grouped as described in table 1 and appendix A.

An abstract of each record is then prepared. Although much more elaborate forms may be used, 3 by 5 in. cards arranged as in figure 1 have been found adequate for the abstract and coding. Cards that can be punched in the margin to facilitate sorting may eventually repay the additional initial cost. In any event, cards should be used in preference to lists, because cards can easily be arranged and rearranged into various combinations, for example, by disease group or by surgeon. Incidentally, the card is almost identical with that recommended 40 years ago.[28] Only a few points are essential. The hospital case number (NO) is recorded to avoid duplication and to permit ready reference if it is necessary to consult the record again. The patient's name is not entered. Age is essential because some criteria change at certain ages. Race or color (W, C) is entered because the attitude of certain hospitals and physicians may be different for white and colored. Place of usual residence (AREA) may indicate whether cases from a distance more often present unusual problems, and it is used for "hospital area" or community incidence studies. Dates of admission (ADM) and discharge (DIS) are needed to delineate trends and to evaluate the length of stay.

The clinical diagnosis need be entered only in the cases listed in table 2. The preoperative diagnosis (DIAG) is taken from admission note, history, or operative sheet, whichever gives the clearest evidence of having been recorded prior to operation; if it does not seem clear, appropriate selections from the history and physical examination (H&P) may be entered as substitutes or supplements. This is a convenient place in which to record documentation. Consultation (CONS) calls for identification of the consultant and a brief note of his findings and recommendations. There should be at hand an up-to-date list of medical staff members with their privileges.

Fig. 1.—Abstract card for medical audit of female pelvic surgery. NO, hospital case number, W, C, race or color, P, G, pregnancies and deliveries, MD, identity of surgeon; AREA, place of usual residence; ADM, DIS, dates of admission and discharge DIAG, preoperative diagnosis, H & P, history and physical examination, CONS, consultation, OP, operation, EUA, examination under anesthesia, E, endometrium; C, cervix uteri, U, corpus uteri, OR, right ovary, and L, left; TR, right tube, and L, left, A, appendix, and PR, pelvic repair

Operative procedure is indicated by a check mark to the left of the vertical line, in the space corresponding to the procedure: examination under anesthesia (EUA); pelvic repair (PR): or the tissue or organ: endometrium (E), cervix uteri (C), corpus uteri (U), ovary (O), tube (T), appendix (A). Previous operation on or removal of an organ or structure is noted to the right of the line; this is of great importance in classifying operations on tube or ovary. The pathology report is recorded in the space to the right of the vertical line, employing appropriate abbreviations. Although it may be interesting to note the size of a fibromyoma or ovarian cyst, size is not recorded due to its relative inaccuracy. Complications and death are entered. The identity of the surgeon (MD) is recorded in code, which ideally should be changed periodically to prevent possible bias by the reviewer. Entries for previous pregnancies and deliveries (P, G) are required only in operations to relieve sterility, but I like to record them routinely. After "OP" one may wish to record date, the identity of the assistants at operation, the method of anesthesia, and the preoperative assessment of surgical risk. A somewhat different card is used for cesarean sections.

Presentation of Data

From the case abstracts, statistical tables are prepared for the medical audit committee, the joint liaison committee (several members of the trustees, administration, and medical staff), and other groups if necessary. Salient features of the cases are summarized by time periods to show the progress made toward a standard degree of compliance with criteria. For example, table 3 presents for nine 13-week periods the number of cases of hysterectomy without oophorectomy that were justified, subdivided into those where more extensive surgery would have been justified and those where the operation was suitable as done, and the number of criticized cases, subdivided into those where less extensive surgery would have been justified and those where no surgery was justified according to the criteria employed. It shows whether hysterectomy was vaginal or abdominal and the cases where the cervix was left in place. The operations are also classified as to whether uterine curettage, cervical biopsy, and examination under anesthesia were done, and the number of deaths is shown.

*Data not obtained.

A list of cases such as shown in table 4 substantiates the statistical table. These one-or-two-line summaries constitute an important part of the internal medical audit and are helpful to the hospital's medical audit committee and in the external audit.

Justification for Operations Resulting in Castration or Sterilization as to Necessity

Table 5 shows the total number of operations that resulted in castration or sterilization, in a hospital subjected to medical audit and in two teaching hospitals used as controls, and the number and percentage of operations that were justified according to the criteria. The cases from the teaching hospitals were of consecutive, unselected white patients operated on in late 1952 and early 1953. Nearly all of the cases in the hospital that was audited, the study hospital, were of white patients. The operations in the first and second 13-week periods were done before the medical audit was commenced; however, another area hospital used by many members of the study hospital staff was being audited during the first and second periods.

When the criteria described in this article were applied to the study hospital, the total number of operations declined markedly, from a level of about 230 per period in the preaudit era to an average of 130 in the third and fourth periods during which the medical staff knew that a medical audit was under way but before the criteria had been announced. There was a further reduction to an average of about 80 cases after the

[*] Results in hospital subjected to medical audit and in two teaching hospitals that served as controls

A striking reduction in criticized operations took place, from 162 and 156 in the preaudit periods to an average of 16 in the four most recent periods. There was some fluctuation in the number of justified operations, but they held fairly steady between 61 and 87 per period, which presumably represents a rather constant need.

Standard for Percentage Justified.—At the beginning of the audit, when only 30% of operations in the study hospital were considered justified, it seemed almost hopeless to expect 80% compliance with the criteria, a standard that had been set by calculating from Doyle's article [15b] an average of 82% for the four best hospitals in his series of 35 nongovernmental hospitals. Of the hospitals used as controls, teaching hospital 2 had 80% of its 86 cases justified, but in teaching hospital 1 only 72% of the 92 cases complied. The criteria had been applied to the controls exactly as in the preaudit periods in the study hospital, i. e., all operations had taken place long before a medical audit or any mention of criteria and thus represented what surgeons were doing without specific guidance. There was a tendency in the teaching hospitals to sterilize by hysterectomy without documentation and to remove the uterus incidental to pelvic repair in women under age 35 if they had two or three children; otherwise the controls would have complied in well over 80% of cases. Taking all factors into consideration, a standard of 80% seemed reasonable, and experience with the audit has shown that over a period of time a standard of 80% can be attained in any hospital without reducing the number of sterilizing and castrating operations clinically necessary and justifiable by significant pelvic pathology.

Analysis of the Work of Individual Physicians

Nearly 40 different surgeons performed these operations in one or another of the periods studied, but in any one period the figure would be between 25 and 30. In the preaudit periods only five active surgeons had *70% or more of their cases justified, but after the audit* was commenced the situation was progressively reversed, until by the sixth period, during which 26 surgeons were active, 21 had at least 70% of their cases justified. This change occurred without drastic disciplinary measures such as suspension or dismissal from the medical staff. A joint liaison committee representing the governing board, medical staff, and administration reviewed quarterly statistical summaries of the medical audit. The identity of the various surgeons *was not divulged to this group as a whole, but the* president of the medical staff, assisted by the physician members of the joint liaison committee, interviewed the surgeons with poor individual records and sought their compliance. Near the end of the fourth period the criteria and standards were printed and distributed to *the staff and further improvement occurred.*

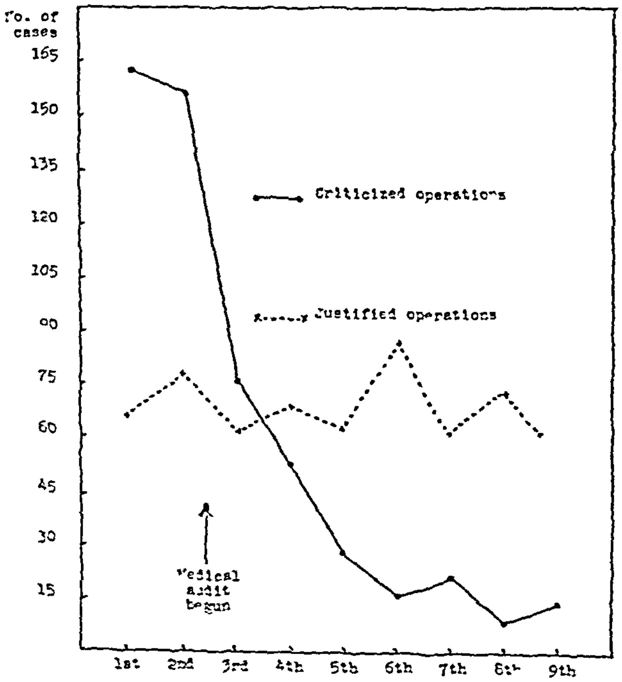

Fig 2—Trend in justified and criticized operations that resulted in castration or sterilization during nine consecutive 13-week periods.

Age Distribution

Corresponding to the reduction in number of operations, there was a marked shift away from the younger age groups, as illustrated in table 6 for a preaudit period and an audit period. There were decreases of 36 operations in persons under age 30, of 61 in the age group 30-39, and of 24 at ages 40-49. The number of operations at ages 50 and over remained about the same.

Mortality

Mortality includes all deaths during or following operation and while the patient is still in the hospital, unless death is due to a wholly extraneous cause. In the study hospital there was one death in 462 operations in the 26-week preaudit period, a case fatality rate of 0.22%. This was a case of cardiac arrest on the operating table, apparently due to anesthesia and operation. A 0.29% rate in the 698 operations in the 91-week audit period was due to one death occurring 23 days after operation, caused by bronchopneumonia following pulmonary infarction on the 8th day, and a second death due to pulmonary infarctions on the 12th and 22nd postoperative days. These case fatality rates are well within the expected 0.4% for major operations of this type.[29]

TABLE 6.—*Age Distribution for Castrating and Sterilizing Operations, Preaudit (First Period) and After Audit in Effect (Sixth Period)*

	Preaudit		Audit in Effect	
Age Groups	No. of Cases	% of Total	No. of Cases	% of Total
20-29	38	17	2	2
30-39	88	39	27	26
40-49	62	27	38	36
50-59	28	12	22	21
60-69	11	5	11	11
70 & over	1	..	4	4
Total	228	100	104	100

A shortcoming of case fatality rates is that they do not distinguish between needless and justified operations; thus three deaths in 300 needless operations and two deaths in 200 justified operations, a total of five deaths in 500 operations, give a 1% case fatality rate, but, if the 300 needless operations are not done, the case fatality rate is still 1% due to two deaths in 200 justified operations. A preferred method is to assume a fairly constant, genuine need for operations of this kind and to calculate mortality in terms of time periods. By this method, the mortality expressed on an annual basis was 2.0 in the preaudit period but only 1.1 in the audit period.

Comparability of Laboratory Reports

Where laboratory reports are relied upon heavily, as in the medical audit of female pelvic surgery, it is necessary to be sure that the tissue diagnoses and terminology are comparable with those in other hospitals. A method sometimes employed is to send "unknowns" to the laboratory to be checked, but I have observed that in such circumstances the laboratory may use much more care than in routine examinations. The question to be answered is not whether the laboratory is capable of achieving accuracy through special effort but whether its routine work is reliable. The latter is best determined by checking the tissue diagnoses made previously.

After consulting the American College of Pathology and the American Society of Clinical Pathologists as to procedure, six slides were drawn at random from each category, such as cancer of the cervix, fibromyoma of the uterus, and follicular cyst of the ovary. These were submitted to two pathologists in other communities who gave their interpretations without knowing the findings of others. The chief discoveries were that the diagnosis of early cancer of the cervix, and of endometriosis, often was not confirmed and that the true incidence of endometrial hyperplasia, which was being diagnosed in 60 to 65% of all uterine curettages, was only 5 to 8%. Further, it was learned that the use of misleading terms such precancerous or massive degeneration at times led to the removal of a normal uterus or ovary and that frozen section examination for rush diagnosis in the course of an operation was frequently unreliable.

The most important feature of this kind of study, which will be reported more fully elsewhere, is that it tests routine performance rather than capabilities that may not be used except in special circumstances. As employed in the medical audit, it has brought to light and helped correct errors and bias in reporting or implying the presence of significant pathological changes where none existed. Only rarely did it reveal the presence of cancer or other findings that had been missed.

Community Incidence

The local medical society and the state health department generously assisted in making a broad study of the incidence of several kinds of surgical operations on residents of the city, the medical society being especially helpful in influencing all hospitals in and near the city to make their records available for study and the health department in helping collect statistics covering the 26 weeks just prior to the first period and the 26 weeks of the third and fourth periods shown in tables 3 and 5. Before any audit was undertaken the city's resident rate was 3.7 hysterectomies per 1,000 white population per year. A year later, in the third and fourth periods, after a medical audit had reached an advanced stage at one hospital and was getting under way at another hospital in the city, the hysterectomy rate expressed on an annual basis was only 2.1 per 1,000. As a result of this study it was clear that the observed reduction in criticized cases in the study hospital was real and not due to such operations merely being shifted to other hospitals.

Summary

The purpose of medical auditing is to make certain that the full benefits of medical knowledge are being applied effectively to the needs of patients. A medical audit employing objective criteria is an important addition to such methods of insuring good medical care as the hospital standardization program carried on for many years by the American College of Surgeons and now continued by the Joint Commission on Accreditation of Hospitals in broadened and intensified form, the American Medical Association's programs for accreditation of medical schools and the approval of internships and residencies, and the activities of the American Hospital Association and regional organizations of hospitals. The special merit of the medical audit procedure described herein is that, whereas most hospital approval programs have assessed the capability of the hospital and staff to do good work but have not tested the work itself, this procedure employs scientific methods that attempt to measure and evaluate the actual care given to patients.

The medical audit is an evaluation of medical care in retrospect through analysis of clinical records. Audits may be termed internal when they are done by the hospital itself and external when performed by an independent agency. Every hospital should maintain an internal audit, in which case an external audit by an agency such as the Joint Commission on Accreditation of Hospitals need consist only of testing the accuracy and completeness of the internal audit. The effectiveness of such an arrangement depends on the use of the same definitions, criteria, and standards throughout, so that there will be common understanding by those whose work is audited and those who make the audits To place medical auditing on a scientific basis it is necessary to (1) employ uniform definitions for classifying diagnosis and treatment, (2) verify statements in the clinical record by means of written reports of laboratory examination or of consultation, or by other forms of documentation, (3) determine whether the pathology, x-ray, and other clinical laboratory reports on which many of the criteria are based are comparable in accuracy and terminology with those of control hospitals, (4) judge results according to objective criteria, and (5) measure the degree of compliance with criteria against standards derived from observations in control hospitals. The application of these methods to major female pelvic surgery has shown that they can be highly effective in bringing to light and helping to correct situations where the type of operation is unsuitable or the diagnostic study is inadequate and especially where the number of operations is excessive

Diabetes, the Pituitary and the Adrenals.—With regard to the adrenal cortex, there are three types of diabetes seen clinically. The first is that which begins with pituitary hyperactivity such as in cases of pituitary tumor, excess adrenal stimulation, and Cushing's disease. The second is that seen in Cushing's syndrome or after excess exogenous cortisone. It appears to be identical with the first type except that it originates in the adrenal itself In most of these, the diabetes is reversible. The third type which up to the present is rare is that of an aldosterone-producing tumor. I have observed three patients having proven aldosterone-producing tumors. Apparently in these patients diabetes is reversible, but there is no clear evidence of control of aldosterone production by pituitary function. As to the adrenal medulla, pheochromocytoma is not infrequently associated with diabetes which is almost always cured . . after removal of the tumor. The excess production of adrenalin or noradrenalin seems to bear no relation to pituitary function Such a preamble is all by way of saying that pituitary hormones and hormones related to pituitary and adrenal function are only parts of a total complex having intimate connection with hyperglycemia and with some instances of disease which we at present classify as diabetes mellitus The pituitary hormones which we think of as intimately connected with the cause and persistence of some cases of human diabetes are. 1. growth hormone, as in acromegaly, 2. excess ACTH, as in the rare instances of pituitary tumor with Cushing's disease, and possibly 3 another factor which we might call "the Con factor" bearing on hexokinase activity and which may be neither ACTH nor growth hormone.—E. P. McCullagh, M D, Diabetogenic Action of the Pituitary, *Diabetes*, May-June, 1956

THE UNITED STATES MEDICAL MISSION ON MICROBIOLOGY AND EPIDEMIOLOGY TO THE SOVIET UNION

Colin M. MacLeod, M.D., New York
Karl F. Meyer, M.D., San Francisco
John R. Paul, M.D., New Haven, Conn.
Michael B. Shimkin, M.D., Bethesda, Md.
and
Richard E. Shope, M.D., New York

This report is a digest of some of the facts learned and impressions gained in the course of a recent visit to the Soviet Union. The visit was carried out in February and March, 1956, by us. It was sponsored by the Public Health Service of the Department of Health, Education, and Welfare, with the approval of the Department of State. Its purpose was to effect an exchange of scientific and technical information in several medical fields, but particularly in that of general and applied microbiology. Such missions between the United States and the Soviet Union were carried out during World War II, but were then interrupted. In the light of the changed international situation, as reflected in the Geneva conferences in 1955, it has now been decided that such exchanges should be resumed.

To initiate exchanges in the medical field, a Soviet medical mission came to the United States on Jan. 18, 1956. The interest of its members was primarily in poliomyelitis and other aspects of virology. This group included Prof. M. P. Chumakov, Prof. M. K. Voroshilova, and Dr. L. I. Lukin of the Institute for the Study of Poliomyelitis in Moscow, and Prof. A. A. Smorodintzev of the Institute of Experimental Medicine in Leningrad. They spent 35 days in the United States and visited laboratories in Boston; New York; New Haven, Conn.; Baltimore; Pittsburgh; Cincinnati; Cleveland; Minneapolis; and Bethesda, Md.

The United States mission, which was similarly concerned with microbiology and epidemiology, was in the Soviet Union between Feb. 27 and March 28 and met over 200 Soviet medical scientists in 25 research and educational institutions in Moscow, Leningrad, Kharkov, Kiev, Rostov-on-Don, and Sukhumi. (The mission wishes to express its gratitude for courtesy shown it by many Soviet scientists, especially Prof. V. M. Zhdanov, Deputy Minister of Health, who arranged the program, and Mr. L. N. Mekhedov, who was assigned to the mission as its interpreter and guide.) Conferences were held at the research institutes, and included visits to the laboratories and observations of the facilities for research. Special meetings were also held to discuss medical research organization, medical education, and the production and distribution of biological and other medicinal preparations.

The members of the mission learned that Soviet medical research is organized under a system of research institutes, the staffs of which vary in size from approximately 100 to 1,000 individuals, of whom about one-third are of professional rank. There are some 300 medical research institutes in the Soviet Union, with great centralization in Moscow, Leningrad, and Kiev. The institutes operate under three administrative systems: the Academy of Medical Sciences, USSR; the Ministry of Health, USSR; and the constituent republics of the Soviet Union. The academy institutes accentuate basic research, and the ministry institutes emphasize practical or applied research, including the production of vaccines and other biologicals, while the institutes under the republics are primarily concerned with local problems. The medical research programs are correlated by the Medical Research Council of the Ministry of Health, whose chairman is Prof. N. I. Graschenkov. The Academy of Medical Sciences has recently formulated its five-year plan in medical research for 1956-1960.

Highlights of Mission Reports

From the individual reports submitted by the members of the United States mission, the following highlights of particular interest have been selected.

Public Health.—According to the official report of the Minister of Health, M. K. Kovrigina, the public health situation in the Soviet Union is satisfactory. Cardiovascular disease and malignant neoplasms are stated to be the first two causes of death. Prof. L. V. Gromashevsky of the Institute of Epidemiology and Microbiology in Kiev, one of the outstanding epidemiologists of the Soviet Union, states that, in the Russian Republic (RSFSR) and Ukraine, no cholera has been seen since 1925 and that plague and Shigella dysentery have also disappeared. There was considerable reticence on the part of Soviet officials when it came to mentioning exact figures regarding the prevalence of specific diseases. This may have been due in part to the fact that no census of the population has been taken since 1939 and that population figures and morbidity rates are not public information. (A few official figures on the Soviet Union have been issued recently in a publication of the Central Statistical Administration of the Council of Ministers, "The National Economy of the USSR: A Statistical Compilation," Moscow, 1956. The estimated 1956 population of the USSR is given as 200,200,000. In 1955 the birth rate was 25.6 and the death rate 8.4 per 1,000. There were 2,627,000 civilian workers employed in public health, of whom 85% were women; of this total, 334,000 were physicians and dentists. There was a total of 1,290,000 hospital beds.) However, the following information was obtained:

In Leningrad, the diphtheria rate is 1.1 per 10,000. There were 235 cases of poliomyelitis in Leningrad during August-September, 1955; a similar outbreak was reported in 1947. Rheumatic heart disease is definitely a problem. Venereal disease and tuberculosis are stated to be "definitely lower" than during the war. In Kharkov, a metropolitan area of about 880,000 population, 22,000 cases of tuberculosis are registered. Rheumatic heart disease is the first cause of death

---

Professor of Microbiology, New York University College of Medicine (Dr. MacLeod); Director, G. W. Hooper Foundation, University of California Medical Center (Dr. Meyer); Professor of Preventive Medicine, Yale University School of Medicine (Dr. Paul); Chief, Epidemiology and Biology Branch, National Cancer Institute (Dr. Shimkin); and Member, the Rockefeller Institute for Research (Dr. Shope).

among children under 14. There are 100-150 cases of diphtheria per year, with one or two deaths. In Kiev, there were 14 cases of malaria of local origin last year. The incidence of typhoid is "less than 1 in 10,000." Leptospirosis is seen sporadically, perhaps 10 cases per year, outside of those occurring during harvest season, which may account for an additional 200 cases per year in the Ukraine.

Development of Vaccines.—Preventive medicine continues to have high priority in Soviet medicine, and there are extensive programs for the control of infectious diseases. Soviet investigators have developed several vaccines composed of living attenuated microorganisms that are stated to be widely used and to have considerable effectiveness.

The vaccine against tularemia, developed by Prof. N. G. Olsufiev of the Central Institute of Epidemiology and Microbiology (Gamaleya), Moscow, is a freeze-dried culture of attenuated tularemia organisms. It is applied percutaneously and induces an immunity that is stated to persist at an effective level for five to six years. Samples of the vaccine were made available to the mission. Prof. P. A. Vershilova, the present director of the Gamaleya Institute, has developed a living attenuated brucellosis vaccine from a strain-19 culture. It is given subcutaneously, in single doses of 150 million organisms, and a good immunity is stated to last for at least a year. Reimmunization, or immunization in individuals showing a positive skin reaction to a test dose, is effected by the percutaneous route.

Soviet investigators also continue their interest in developing an effective influenza vaccine, and such work is being carried out by Professors M. V. Zhdanov, A. A. Smorodintzev, and V. D. Soloviev. The viruses are attenuated by growth on eggs. Apparently they are useful for immunization only if they maintain the capacity to grow on human embryo lung tissue culture. The live attenuated virus strains are incorporated into a polyvalent vaccine that is administered intranasally by spraying. Zhdanov stated that 10 to 12 million people have received this preparation, which is considered safe for anyone over 5 years of age, and that it gives immunity for approximately one year. Its annual administration, usually in October, is considered a routine procedure among certain population groups.

Research in Infectious Diseases.—Soviet investigations of the etiology, transmission, and control of infectious diseases are extensive and important. The Zoology Institute in Leningrad, under Prof. E. N. Pavlovsky, is one of the world's centers of entomology and ecology. Workers there have conducted systematic surveys on animal reservoirs and insect vectors of infectious agents, particularly those of economic importance to medicine and agriculture. Pavlovsky believes that foci of infections are of characteristic topographic, climatic, vegetative, and ecologic make-up and that, if an area combines the appropriate features, it may be expected that a particular infection exists there. The term "landscape epidemiology" has been applied to studies of this type, which are of use in predicting the infection potentials of previously unstudied areas.

Prof. M. P. Chumakov has studied a group of new endemic virus diseases for which the general name "virus hemorrhagic fevers" has been proposed. These are Crimean tick-borne hemorrhagic fever, Omsk hemorrhagic fever, and hemorrhagic nephrosonephritis, which bears extremely close clinical resemblance to the Far Eastern hemorrhagic fever that was extensively studied by American investigators during the Korean war. The virus of Omsk hemorrhagic fever, also tick transmitted, is antigenically related to the spring-summer encephalitis virus. For its prevention, Formalin-killed virus vaccine made from infected mouse brain has been used with success. Transmission of the agent causing nephrosonephritis has not been successful in laboratory animals up to the present time. The virus causing Crimean hemorrhagic fever is infectious for monkeys; no protective vaccine has been prepared as yet.

Prof. P. F. Zdodrovsky of the Gamaleya Institute in Moscow, and one of the eminent Soviet scientists in the field of viruses and rickettsioses, feels that Siberian tick fever is serologically identical with Rocky Mountain spotted fever. He stated that Q fever was very prevalent in the Soviet Union and that an effective inactivated egg-grown vaccine has been developed to combat it.

An interesting new clinical entity was described; it is called two-wave milk fever because of its characteristic diphasic febrile course. Goats, infected as a result of tick bite, develop viremia and hemorrhages into the udder, with resultant virus contamination of the milk and transmission of the virus to persons ingesting such milk. There is considerable evidence that this clinical form of encephalitis is due to the same virus that causes the tick-borne Russian spring-summer encephalitis. It appears to be an example of a neurotropic virus infection being spread by ingestion of milk. A small outbreak of the disease was seen recently in the Moscow region.

Cancer Research.—In the field of cancer research, the studies of Prof. Lev. A. Zilber on the virus aspects of cancer and his detection of apparently unique tumor antigens by guinea pig anaphylaxis reaction are noteworthy. Red blood cell absorption techniques are reported to dissociate the virus and the specific tumor protein in the case of the rabbit papilloma, suggesting that the tumor protein is distinct from the viral antigen. The program in the experimental chemotherapy of cancer, under Prof. L. F. Larionov at the Inst.tute of Experimental Pathology and Therapy of Cancer, is proceeding along the same general lines as in the United States. Main emphasis is in the direction of combining alkylating groups with amino acids and their analogues. Sarcolysine is an addition to the family of alkylating agents, showing an effect on a proportion of disseminated seminoma of the testis in man.

Experiments on Primates.—The medical Biological Station at Sukhumi is the Soviet primate station. It was founded 30 years ago, and the majority of its 600 rhesus monkeys are third-generation to fifth-generation inhabitants. There are 150 annual additions, and it is planned to increase the colony to 1,500 primates. The claimed successful induction of hypertension and coronary occlusion in monkeys placed under psychological stress is of special interest, although experiments have been performed on only a few animals, and there has been difficulty in repeating them. Benign and malignant neoplasms have been observed to occur in older monkeys, including single cases of cancer of the kidney and of the female breast, granulosa-cell tumor of the ovary, and sarcoma of the scalp. Osteogenic sarcomas have been induced after intramedullary introduction of methylcholanthrene and of radium.

Exchange of Materials.—The exchange of missions resulted in an exchange of materials as well as of information. The United States mission received from the Ministry of Health of the USSR 36 items of biological material, including live tularemia and brucella vaccines, five hemorrhagic fever virus strains, and 16 strains of influenza virus recovered in the Soviet Union. Over 150 books, pamphlets, and other printed items were also made available as well as especially compiled published and unpublished instructions for the preparation, control, and use of 18 biological products.

Conclusions

With regard to medical research, it is the opinion of the mission that the leading figures of Soviet medical science would command the same relative position in other countries. The mission met many talented, original workers who are well acquainted with modern techniques and instrumentation. Soviet research workers seem to be well supported with facilities and technical assistants. Within their sphere of research interest, they appear to have considerable freedom to initiate and to conduct their investigations. The research institutes are modestly but satisfactorily equipped, and the items in them of Soviet make are of recent manufacture. Great efforts are being made to build up the supply of laboratory equipment.

In general, the directions of Soviet medical research are similar to those being followed in the United States. In areas such as experimental immunology, hypersensitivity, and microbial genetics, there appears to be little emphasis, and tissue culture techniques are just beginning to be developed. In a few instances approaches and concepts are novel and are deserving of fuller consideration and investigation. Soviet scientists are well acquainted with the work and results of non-Soviet scientists. All research institutes have excellent representative journals and books from America and other countries, and their review collections include abstracts of contributions from all countries. Books and journals considered by them to be of importance are translated and published in Russian.

It is our opinion that medical scientists of the United States would profit from a better knowledge and understanding of the progress and the results of medical research in the Soviet Union. Appropriate steps are recommended to develop channels of communication between the medical scientists of the two countries by exchange of literature, materials, and personnel. The development of centers for the evaluation of Soviet medical research and the wide dissemination of the information among American scientists would be very useful.

National Institutes of Health, Bethesda 14, Md. (Dr. Shimkin).

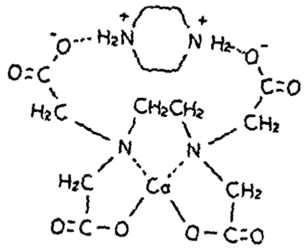
COUNCIL ON PHARMACY AND CHEMISTRY

NEW AND NONOFFICIAL REMEDIES

Monographs and supplemental statements on drugs that appear in this column have been authorized by the Council for publication and inclusion in New and Nonofficial Remedies. They are based upon the evaluation of available scientific data and reports of investigations.

H. D. Kautz, M.D., *Secretary*

Piperazine Calcium Edathamil.—A chelated compound produced by reacting edathamil with calcium carbonate and piperazine.—The structural formula of piperazine calcium edathamil may be represented as follows:



Actions and Uses.—Piperazine calcium edathamil is proposed for the treatment of pinworms (Enterobius vermicularis) and roundworms (Ascaris lumbricoides) on the basis of its piperazine content. Large amounts of the chelated compound are relatively nontoxic to laboratory animals. Likewise, there have been no reports of toxic reactions to date after administration of therapeutic doses to man. On the basis of limited clinical experience, it would appear that the chelated form is of the same order of effectiveness as the citrate and tartrate salts of piperazine. (See the monograph on piperazine citrate.)

Dosage.—Piperazine calcium edathamil is administered orally. Dosage is expressed in terms of the hydrous base, piperazine hexahydrate. The proposed dosage for pinworms in children or adults is 75 mg. per kilogram of body weight per day, administered at one time or in two divided doses for a period of 15 days. Dosage for smaller children and infants is reduced according to weight. For roundworms, a one-day course of treatment consisting of 100 mg. per kilogram of body weight is proposed. Further clinical evidence is necessary to establish the lowest optimum dosage of piperazine calcium edathamil.

Preparations for use as stated for the foregoing drug are marketed under the following name: Perin.

Endo Laboratories, Inc., cooperated by furnishing scientific data to aid in the evaluation of piperazine calcium edathamil.

Refractive Errors in Diabetics.—Sudden changes in refractive errors should make one suspect the presence of diabetes. As the blood sugar concentration varies, the refractive state of the eye may change from hyperopia to myopia and vice versa. These changes, according to Duke-Elder, have been attributed to fluid entering the lens osmotically, causing myopia. Under treatment, the condition is reversed so that the fluid drains from the lens, causing hyperopia. Therefore, regardless of the cause, sudden changes in refractive errors call for a blood sugar examination or at least a urinalysis.—L. W. Statti, M.D., Ophthalmic Problems in Diabetes, *Geriatrics,* June, 1956.

COUNCIL ON FOODS AND NUTRITION

Report to the Council

The following comments have been prepared at the request of the Council.

Eugene H. Stevenson, M.S.
Acting Secretary.

MATERNAL FACTORS IN HYPOCHROMIC ANEMIA OF INFANCY

Calvin W. Woodruff, M.D., Nashville, Tenn.

The relative importance of maternal iron deficiency as a predisposing factor in the development of hypochromic anemia (nutritional or iron deficiency anemia) in infants is difficult to evaluate. Several recent studies of iron metabolism provide pertinent evidence.

The stores of iron in the developing fetus are derived entirely from the maternal supply of this element by the transfer of iron across the placental membranes. The iron content of fetuses of varying weights has been reinvestigated by Widdowson and Spray,[1] who found that the iron concentration in the fetus remains constant throughout intrauterine life. The concentration averages about 7.5 mg. per 100 gm. of fetal weight. The liver and spleen contain less than 19% of the total fetal iron. The quantitative importance of the transfer of iron to the fetus during the last trimester of pregnancy depends upon the greater absolute growth during this period.

During the latter half of pregnancy, this transfer of iron to the fetus is reflected by an increased absorption of iron by the mother as measured by the administration of radioactive iron (Fe^{59}).[2] Approximately 10% of the tracer dose appeared in the circulation of infants born to mothers so studied. In a group of nonanemic infants, another observer noted that transplacental Fe^{59} was not diluted by dietary iron until the infant was 3 to 4 months old.[3] In a few instances there was evidence suggesting that transplacentally acquired iron not present in hemoglobin at the time of birth was used for hemoglobin synthesis later in infancy; however, such supplies were judged to be small in relation to the amounts of iron contained in circulating hemoglobin. The conclusion that the iron available to the newborn infant for formation of hemoglobin is present preponderantly in the circulating hemoglobin at birth is supported by this and other recent evidence.[4] Full-term infants born to nonanemic mothers normally receive supplies of iron during intrauterine life adequate to meet their requirements for at least three to four months. The smaller birth weight and more rapid growth of premature infants result in acceleration of this same sequence of events, with earlier exhaustion of their transplacental supplies of iron.

Much less is known concerning the placental transfer of iron when the mother has iron deficiency with hypochromic anemia of such severity that confusion with the physiological fluctuations of hemoglobin concentration during the latter months of pregnancy is unlikely. The study of Strauss [5] was based on unquestionably anemic mothers. The infants born to these anemic mothers (hemoglobin concentration less than 7 gm. per 100 ml. of blood) had normal hemoglobin levels at birth but had developed hypochromic anemia when they were reexamined at one year of age. A comparable group of infants born to nonanemic mothers and with similar feeding histories did not develop anemia. When iron was administered before delivery to three mothers deficient in iron, it prevented the development of anemia in their infants. Severely anemic mothers, then, seem to provide their infants with less iron than do normal mothers. No difference in the incidence of hypochromic anemia was apparent in the infants of mothers whose hemoglobin concentrations during pregnancy fell near the extremes of normal variation.[6] In other words, the physiological variations in hemoglobin concentration in pregnant women do not indicate an inadequate transfer of iron to the fetus as judged by this criterion.

Maternal iron depletion is an etiological factor in the development of hypochromic anemia of infancy. The available evidence indicates that such depletion would be manifested by a severe, untreated hypochromic anemia in the mother. Maternal iron deficiency, as reflected by severe anemia, is not a common predisposing factor in iron deficiency anemia in infants in the United States at the present time; its importance in other parts of the world cannot be assessed accurately. The iron nutriture of the infant is determined by many factors such as birth weight, perinatal hemorrhage from the infant's circulation, deprivation of placental blood, maternal iron deficiency, and such postnatal factors as dietary intake and growth rate.[7] The importance of maternal iron deficiency as a cause of nutritional anemia of infancy should not be forgotten, despite the fact that the other factors mentioned are found more frequently, particularly a low dietary intake of iron during infancy.

ABUSE OF BARBITURATES

GUEST EDITORIAL

Harris Isbell, M.D.

Like other drugs that have powerful depressant effects on the central nervous system, the barbiturates are subject to uncontrolled and improper use by maladjusted persons. Such misuse takes many forms. The barbiturates may be used in suicidal attempts, they may be taken to reinforce the effects of alcohol, or they may be used as antidotes for central nervous system stimulants, such as the amphetamines. Finally, long-continued ingestion of large amounts of these drugs leads to the development of "true addiction" manifested by convulsions and a delirium after sudden withdrawal of barbiturates.

The clinical symptomatology of barbiturate intoxication is strikingly similar to that of intoxication with alcohol.[1] Persons who have ingested large doses of barbiturates show difficulty in thinking, impairment of ego controls, poor judgment, emotional instability, and, at times, a toxic psychosis. The neurological signs in both acute and chronic barbiturate intoxication include nystagmus, dysarthria, and ataxia in gait and station. Obviously, persons who are moderately to severely intoxicated with barbiturates are menaces, not only to themselves but to other persons. It was long thought that barbiturates were not addicting. However, in 1928 Pohlisch[2] clearly described the symptoms that follow withdrawal of barbiturates. Later, Dunning,[3] Kalinowsky,[4] and others in the United States noted the appearance of convulsions after discontinuation of use of barbiturates in chronically intoxicated persons. Seevers and Tatum[5] observed convulsions after withdrawal of sodium barbital from chronically intoxicated dogs, and Fraser and Isbell[6] noted not only convulsions but also a "canine" delirium.

In recent years the clinical symptomatology of chronic barbiturate intoxication and withdrawal has been clearly delineated.[7] It is now known that if barbiturates are withdrawn from persons who are ingesting as much as 0.8 gm. or more of pentobarbital or secobarbital daily, weakness, tremor, and anxiety occur in all cases; 75% of patients will have one or more convulsions; and 60% will develop a toxic psychosis closely resembling delirium tremens. Even death has been reported during abstinence from barbiturates in a strongly addicted patient.[8] Although anxiety, tremor, and weakness frequently follow withdrawal of pentobarbital or secobarbital from persons who have been ingesting 0.6 gm. daily, the more severe symptoms of convulsions and delirium rarely occur. Symptoms after withdrawal of these barbiturates from patients who have been ingesting 0.4 gm. or less daily are minor in nature. Quantitative aspects of the problem are important since they show that barbiturates in the doses ordinarily used do not create a serious grade of physical dependence (addiction). This occurs only under conditions of uncontrolled abuse.

Only a beginning has been made in the study of this type of chronic intoxication. Nothing is known concerning the incidence of the condition, and very little is known of the psychiatric and social factors associated with it. As yet, no information on the biochemical and physiological disturbances responsible for the withdrawal symptoms is available.

Some of the symptoms that follow withdrawal of barbiturates bear a striking resemblance to phenomena observed in chronic alcoholism. Convulsions and delirium occur in both conditions. Abrupt withdrawal of alcohol after chronic intoxication has recently been shown to precipitate convulsions and delirium in both man[9] and dogs.[10] These facts suggest that chronic alcoholism and chronic barbiturate intoxication may induce similar changes in the functioning of the central nervous system and that these two intoxications may be partially equivalent in terms of pathological physiology. If this is true, adequate doses of alcohol should partly or completely suppress symptoms of abstinence from barbiturates and, conversely, adequate amounts of barbiturates should suppress symptoms of abstinence from alcohol. Recently, Fraser[10] has shown that alcohol does partly prevent symptoms of abstinence after withdrawal of barbital from chronically intoxicated dogs. Though the reverse experiment—substitution of barbiturates in animals chronically intoxicated with alcohol—remains to be done, the evidence for partial equivalence of chronic alcoholism and barbiturate intoxication is becoming quite strong. Such equivalence would explain how it is possible for chronic alcoholics to substitute alcohol for barbiturates and barbiturates for alcohol.

The medical and pharmaceutical professions bear a heavy ethical responsibility in prescribing and dispensing barbiturates. Physicians must realize that these drugs are potentially dangerous and that they can, under certain circumstances, create a dangerous type of addiction. Simple insomnia alone is seldom a valid indication for use of barbiturates. Prescriptions should be limited in amount and the laws against refills without a new prescription should be strictly observed. Great care should be exercised in prescribing barbiturates for unstable persons, and such patients should be carefully checked and followed. One should not prescribe a barbiturate for strangers unless the indication for the drug is unmistakable.

OVER-THE-COUNTER MEDICAMENTS

The recent Food and Drug Administration hearing as to whether present prescription requirements should be removed from hydrocortisone preparations for topical use warrants mention of the regulations concerning this matter. Many do not understand how drugs are released for over-the-counter sale. Current legislation (the Food, Drug and Cosmetic Act of 1938 and the Durham-Humphrey amendment of 1952) implies that any drug potentially unsafe when not used under proper medical supervision shall be restricted to sale by prescription only. At any time that a manufacturer, or even an interested person, believes the prescription restriction is no longer necessary to protect the public, and has evidence to support this contention of the drug's safety, he may petition the Food and Drug Administration to allow over-the-counter sales, provided, of course, labeling includes what is deemed by the FDA to be adequate directions for use and necessary warnings.

Over-the-counter sales are tantamount to self-medication. Aside from the problems resulting from unread or misread labels being the greatest element of danger, the probability of delaying proper diagnosis is always present. This may result from giving the individual a temporary feeling of well-being, or may even mask what were evident physical signs. Most "proprietary" medicaments sold today have, by virtue of clinical experience, proved themselves to be of reasonable potential harmlessness. It is, of course, the medical and legal interpretation of the word reasonable that is the crucial point of the matter. The definition of reasonably safe must not be limited just to lack of side-effects with normal dosage, but, of very great importance, there must also be consideration of what amounts the self-treating patient is likely to ingest or apply and the precipitation of adverse effects by possible or probable excess usage.

Petitions for removal of the prescription-only requirement on a drug are published in the *Federal Register*. If controversy arises, subsequent open hearings may be held. After the presentation of evidence, as well as occasional invited testimony, the Food and Drug Administration makes its decision, which under present law becomes effective for all manufacturers concerned, regardless of their beliefs on how the drug should be sold. One of the factors usually presented in support of a drug's safety is its past clinical use without ill or untoward effects having been reported. The medical profession therefore has an additional responsibility in these matters. This is the obligation to report any adverse consequences observed from medicaments used in practice. Unbiased observations from the practitioner's office could well be the essential factor in determining which drugs are potentially unsafe for over-the-counter sale. Medicine not only has the time-tested and traditional function of determining the therapeutic value of drugs but equally has the moral liability of assuring a drug's safety, especially when it is available and used without medical supervision.

PASSAGE OF FETAL RED BLOOD CELLS INTO MATERNAL CIRCULATION

The normal intact placental barrier prevents passage of fetal red blood cells into the maternal circulation. Occasionally, in the course of a pregnancy or during delivery, a break in the placental barrier may permit fetal red blood cells to enter the maternal circulation. This is the mechanism by which Rh sensitization can result from a pregnancy of an Rh-negative woman with an Rh-positive fetus. In general when a break in the placental barrier occurs, the amount of fetal blood that enters the maternal circulation is relatively small. so that the presence of the fetal red blood cells would not be detectable. The situation may be compared to giving a transfusion of Rh-positive blood to a nonsensitized Rh-negative recipient. It has been shown that the presence of the donor's Rh-positive cells mixed with the recipient's own Rh-negative cells would be demonstrable by differential agglutination only if at least 50 cc. of Rh-positive blood is transfused. Since ordinarily such a large volume of fetal blood would not enter the maternal circulation, the fetal cells would not be demonstrable in most cases.

In rare instances, while still in utero the fetus may lose substantial amounts of blood by bleeding from the placental surface into the maternal blood sinuses. When bleeding is extreme, a stillbirth may result, or the baby at birth may exhibit extreme anemia. In such cases, theoretically, if a differential agglutination test is carried out at the right time, fetal red blood cells may be demonstrable in the maternal circulation. If the mother is Rh negative and the fetus Rh positive, tests on the mother's blood may then show the presence of the baby's Rh-positive red blood cells. Even assuming that the baby's entire volume of blood should bleed into the maternal circulation, this would amount to only about one twenty-fifth of the mother's own blood volume. Thus, only one twenty-fifth of the mother's red blood cells after such an incident would react as Rh positive, and the appearance of the agglutination reaction would be quite different from a true Rh-positive reaction. Therefore, an experienced technician should have no difficulty in distinguishing such a reaction from a true Rh-positive test.

ORGANIZATION SECTION

SEATTLE CLINICAL MEETING

The Scientific Program for the Seattle Clinical Meeting of the American Medical Association, Nov. 27-30, is outstanding for its compactness and scope. One-hundred fifteen subjects will be discussed in four rooms simultaneously over a three and one-half day period, with use of panel discussion groups, color television presentations, lectures, and motion pictures. There will be 93 scientific exhibits covering the full range of medicine, with demonstrations during the entire period of the meeting. Subjects include obstetrics and gynecology with several panels, television presentations, exhibits, and manikin demonstrations. Hypertension will be considered in detail with a panel and several exhibits, while problems of the aging will be discussed for an entire morning, as well as being presented in motion pictures. The panel on fractures will be supplemented with fracture demonstrations in the Scientific Exhibit. The lecture program includes a large number of subjects and covers many of the problems of the physician in general practice.

Among other features, exhibits will show the contribution of physicians to the development of the Pacific Northwest, including Oregon, Washington, and Vancouver. All scientific activities will be located in the Civic Auditorium with meeting rooms in close proximity to each other and to the Scientific Exhibit. Restaurant facilities will be available in the Auditorium, making it possible for physicians to spend the entire day at the meeting. The program will be continuous, with several features taking place during the noon hour.

THREE NEW MEMBERS ON RURAL HEALTH ADVISORY COUNCIL

The three new members of the advisory council of the American Medical Association Council on Rural Health are Mrs. Haven Smith, Chappell, Neb., chairman, American Farm Bureau women's committee; Arthur Andersen of Ault, Colo., president, Colorado Farm Bureau Federation, both members of the American Farm Bureau Federation's board of directors; and Joseph Ackerman, managing director of the Farm Foundation, Chicago. At the recent advisory council meeting in Chicago, a progress report was made on a three-point program adopted in 1954 and embracing doctor participation, cooperation with country newspapers and farm journals, and a closer relationship between medical societies and agricultural leaders.

INDUSTRIAL HEALTH PROGRAM IN CHICAGO

At the National Safety Congress to be held Oct. 22-26 in Chicago, the A. M. A. Council on Industrial Health is co-sponsoring a special program on "Medicine in Industry" with the American Society of Safety Engineers and the Occupational Health Nursing Section of the National Safety Council. The one-day session Oct. 25 in the Gold Room of the Congress Hotel will feature medical authorities discussing the following topics: (1) "The Injured Back in Industry," J. Huber Wagner, M.D., chief surgeon, U. S. Steel Corp., Pittsburgh; (2) "Vision in Industry," E. B. Spaeth, M.D., Chairman, A. M. A. Committee on Estimation of Loss of Visual Efficiency, Philadelphia; (3) "Physical Examination of Industrial Workers," O. T. Mallery Jr., M.D., director, Institute of Industrial Health, University of Michigan, Ann Arbor; Logan T. Robertson, M.D., Occupational Health Services, Asheville, N. C.; and Charles E. Thompson, M.D., Health Research Center, Chicago. Co-chairmen of the program are B. Dixon Holland, M.D., and Clark D. Bridges of the A. M. A. Council on Industrial Health.

TWO NEW HEALTH FILMS

The A. M. A. Film Library recently acquired two nontechnical films that explain the functions of the heart and endocrine glands. Both films are so simply and effectively illustrated that they may be understood by any lay audience. Designed primarily for college hygiene and health education classes, these films are excellent teaching devices for any public group that a medical society might wish to reach. Bookings may be arranged through the Film Library.

The functions of a healthy and disordered heart are demonstrated in "Common Heart Disorders and Their Causes," a 17-minute film. One of its unique aspects is that it stresses the fact that people with heart disease are able to live long lives without seriously limiting their activities. The second film, "Endocrine Glands—How They Affect You," locates and describes the eight endocrine glands and explains the function of the hormones these glands secrete. The 15-minute film studies the effects of these hormones on growth, metabolism, sexual development, and behavior, and shows what happens when the flow of certain hormones is increased or decreased.

DISCUSSION OF ETHICS CHANGES

Dr. Louis A. Buie, Rochester, Minn., Chairman of the American Medical Association Committee on Constitution and Bylaws, and three A. M. A. staff members spoke at the Tennessee State Medical Association's first County Medical Society Officers Conference in Nashville recently. Seventy-six physicians and 20 auxiliary officers, representing more than half of the state's local societies, attended the program. Dr. Buie discussed the revision of the Principles of Medical Ethics now under consideration by the House of Delegates; C. Joseph Stetler told of his experiences as Director of the Law Department; Thomas A. Hendricks, Secretary of the Council on Medical Service, outlined the services of the A. M. A.; and Stephen T. Donohue, Assistant Director of Public Relations, presented eight basic projects for a county society public service program.

PROCEEDINGS OF THE CHICAGO MEETING

ABSTRACT OF PROCEEDINGS OF THE HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION AT THE ANNUAL MEETING IN CHICAGO, ILL., JUNE 11-15, 1956

(Continued from page 586)

No. 36. Resolution on Approval by State Executive Committees of Nominations by Board of Trustees for Membership in Councils

Dr. Philip H. Jones, for the Louisiana delegation, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, It is desirable that the physicians composing the Councils of the American Medical Association should be representative of the membership of the state societies, and

WHEREAS, A closer relationship between the membership and the Councils should be attained, therefore be it

Resolved, That the Board of Trustees be requested to secure the approval of the appropriate executive committee of the state society concerned before a member is presented to the House of Delegates of the American Medical Association in nomination for election to a Council

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Joseph C Griffith, Chairman, Wisconsin, read the following report, which was adopted.

Resolution No. 36, introduced by the Louisiana delegation asks for approval by an executive committee of a state society before a member is presented by the Board of Trustees to the House of Delegates for election to any Council Your committee is aware of the fact that some members of councils, such as Pharmacy and Chemistry are not physicians, and not members of state medical societies and that multiple nominations are made by the Board of Trustees to this House for election, which would necessitate clearance with state committees at the time, and is of the opinion that this resolution would restrict the Board of Trustees in its work. It is not in favor of its adoption.

No. 37. Resolution on Pharmaceutical Mail Advertising

Dr. R. B. Robins, Arkansas, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The volume of pharmaceutical mail advertising has grown to such tremendous proportions that it is impossible to read, or even scan, this type of literature, and

WHEREAS, Most physicians now either instruct their secretaries to discard this type of mail on receipt or do so themselves, and

WHEREAS, There is excessive duplication of pharmaceutical advertising in our medical journals, by personal representation and by 'throw away" mail literature, the latter representing a waste of large sums of money, therefore be it

Resolved, That the House of Delegates of the American Medical Association adopt a resolution respectfully suggesting to all the pharmaceutical manufacturers the following. (1) Limit mail advertisements and/or samples to once a month mailing in any manner they see fit, and (2) earmark the money which this procedure would save to be contributed, as a tax deductible item, to schools of medicine, pharmacy, dentistry, and nursing for grants-in-aid in professional education and medical research

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Joseph C. Griffith, Chairman, Wisconsin, submitted the following report, which was adopted:

Resolution No. 37 would limit pharmaceutical mail advertising and earmark the money saved for grants-in-aid in professional education and medical research. Your committee recognizes the contributions of the pharmaceutical industry in medical research, in exhibits at meetings, and in advertising in national and local journals, and does not wish to influence further the industries' choice of modes of advertising by any official action. It does not recommend passage of this resolution.

No. 38. Resolution on Rotating Internship

Dr. J. Wallace Hurff, New Jersey, introduced the following resolution, which was referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS, There is considerable dissatisfaction on the part of certain specialty groups relative to straight internship in their specialties to the exclusion of others, and

WHEREAS, In several states it is a basic requirement that each applicant for licensure shall present evidence of having served a rotating internship of at least one year, and

WHEREAS, It is generally recognized that a rotating internship should be the foundation of any specialty training, therefore be it

Resolved, That the House of Delegates go on record as favoring a rotating internship of at least one year as a prerequisite for any special training, internship or residency.

NOTE. The report of the Reference Committee on Medical Education and Hospitals regarding Resolution No. 38 will be found following Resolution No 11.

No. 39. Resolutions on Reaffirmation of Opposition to Inclusion of Doctors of Medicine in the Social Security System

Dr. Troy A. Shafer, for the Texas delegation, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, From all available reports and indications, it appears as though doctors of medicine will not be included for coverage under Social Security in any bill that may be considered further by Congress this year, sentiment polls taken by constituent medical associations show an overwhelming majority of physicians to oppose inclusion in the Social Security System, each successive session of Congress doubtless will see renewed efforts by social planners to bring doctors of medicine into the Social Security System, and, as enunciated by our forefathers, "eternal vigilance is the price of freedom!", therefore be it

Resolved, That the House of Delegates of the American Medical Association reaffirms its unalterable opposition to inclusion of physicians in the Social Security system at any time, and be it further

Resolved, That a copy of this resolution be sent to the President of the United States, to each member of his cabinet, and to each member of the Congress, and that this resolution be publicized by each constituent medical association.

NOTE. The report of the Reference Committee on Legislation and Public Relations concerning Resolution No. 39 will be found following Resolution No. 30.

No. 40. Resolution on Membership of Judicial Council

Dr. Troy A. Shafer, for the Texas delegation, introduced the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws:

WHEREAS, The Judicial Council, one of the standing committees of the House of Delegates, doubtless will have increasing responsibilities in considering matters of great importance to the medical profession, and this likely will mean more meetings, and greater burdens on the members of the Council, if the total membership of the Judicial Council might be increased to nine, much preliminary study of problems could be undertaken by small subcommittees, furthermore, members of a larger Council would undoubtedly appreciate the wider sharing of grave responsibilities, and inasmuch as the Judicial Council is comparable to other standing committees of the House of Delegates, it would be preferable for its members to be elected by the House on nomination by the Board of Trustees in the same manner as with other standing committees, therefore be it

Resolved, That the Bylaws of the American Medical Association be amended as follows.

Chapter XI, Section 2, to be amended to read as follows

Section 2—Membership—(A) The Judicial Council shall consist of nine Active or Service Members elected by the House of Delegates, on nomination of the Board of Trustees Two members shall be elected annually, except every fifth year, when but one shall be elected, each to serve for five years, or until the election and installation of his successor.

Chapter XI, Section 2 (E) to be amended by deleting the phrase, "except the Judicial Council."

REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO THE CONSTITUTION AND BYLAWS

Dr. Jay J. Crane, Chairman, Section on Urology, read the following report, which, after discussion and after a motion to substitute Resolution No. 40 for the report of the reference committee was lost, was adopted:

Resolution No. 40.—Your committee received Resolution No. 40 introduced by Dr. Troy A. Shafer of Texas, increasing the number of members of the Judicial Council and the method of nomination and election of such members. After due consideration and hearings, it was evident to the committee that the Judicial Council is *fully* capable of functioning properly as presently constituted and it is your committee's opinion that an increase in the number of members is unnecessary. Your reference committee knows of no reason at present for changing the method of procedure of selecting members of the Judicial Council. Your committee recommends that this resolution be not approved.

No. 41. Resolution on Care of Patients with Nonservice-Connected Disability in Veterans Hospitals

Dr. James Q. Graves, Louisiana, introduced the following resolution, which was referred to the Reference Committee on Insurance and Medical Service:

WHEREAS, The care of patients with non-service-connected disability, who are veterans, in Veterans Hospitals presents a continuing problem, and

WHEREAS, The further expansion of such care is a threat to the proper and private practice of medicine, therefore be it

Resolved, That the House of Delegates of the American Medical Association request the Board of Trustees to continue its efforts to control this source of abuse.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. John K. Glen, Chairman, Texas, presented the following report, which was adopted:

Resolution No. 41.—Your reference committee recommends approval of this resolution even though approval of supplementary report of the Board of Trustees H, just preceding, may have, by now, accomplished the same purpose.

No. 42. Resolution on Increasing Memberships in the American Medical Association

Dr. Peter J. DiNitale, for the Medical Society of the State of New York, introduced the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

WHEREAS, In New York State there are approximately 24,000 physician-members of the Medical Society of the State of New York, and

WHEREAS, Only about 18,000 of these are members of the American Medical Association; and

WHEREAS, There probably are many physicians throughout the various states and territories of the United States who are not members of the American Medical Association; therefore be it

Resolved, That the American Medical Association augment its efforts to stimulate new memberships in the American Medical Association by an increased, determined, cooperative effort with the various county and state medical associations

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Woodruff L. Crawford, Chairman, Section on Pediatrics, read the following report, which was adopted:

Increasing Memberships in the American Medical Association (Resolution No. 42).—This resolution was introduced for the Medical Society of the State of New York and was considered by your committee. It resolves—that the American Medical Association augment its efforts to stimulate new memberships in the American Medical Association by an increased, determined, cooperative effort with the various state and county medical associations. Your reference committee approves of this resolution and wishes to refer it to the Board of Trustees for what action it may take.

No. 43. Resolutions on Medical Care for Dependents of Members of the Uniformed Services

Dr. Robert L. Novy, for the Michigan delegation, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service:

WHEREAS, The Congress of the United States, as recommended by the Department of Defense, has enacted legislation providing for medical services for dependents of members of the uniformed services, and

WHEREAS, The legislation calls for the supplying of medical services for dependents of members of the uniformed services by civilian doctors and hospitals; and

WHEREAS, The position and policy of the American Medical Association has been clearly set forth by action of the House of Delegates of December, 1954, as follows: "... if it is to be the policy of the government to provide for medical care for dependents of service personnel, the services of civilian physicians and hospitals be used wherever possible, to be paid for at prevailing rates, with provision for *free choice of physicians*," and

WHEREAS, The *recommendations* of the Council on Medical Service as submitted to the Board of Trustees under date of Nov 27, 1954, state that if Congress believes that there is a need for assisting the serviceman financially in providing health services for his dependents while he is a member of the armed forces, it is recommended "That such funds as are made available be provided either (a) directly to the serviceman so that he may purchase his own protection through a voluntary program, or (b) be utilized to purchase services through a 'home town medical care' type of program on a fee-for-service basis for physicians and hospitals, arranged through the individual state medical societies, or their designated agency, and negotiated with the Department of Defense," therefore be it

Resolved, That the House of Delegates of the American Medical Association urge its constituent state and their component county medical societies to cooperate with the Defense Department in the provision of medical services to the dependents of servicemen as provided in P L 569, 84th Congress (Signed by the President, June 7, 1956) utilizing the facilities of Blue Shield and other medically-sponsored plans, *and be it further*

Resolved, That the Board of Trustees of the American Medical Association be, and hereby is, instructed to initiate direct liaison with the Department of Defense and render all reasonable and effective aid and assistance to state and county societies toward the implementation of the intent of P. L. 569, 84th Congress, 1956, and these resolutions

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. John K. Glen, Chairman, Texas, submitted the following report, which, after discussion, was adopted:

Resolution No. 43 on Medical Care for Dependents of Members of the Uniformed Services.—Your reference committee recommends approval of the resolution up to, and including, the word "utilizing" in the first "Resolved." It would delete the rest of that sentence to the colon before "and be it further." It would insert following the word "utilizing" the following: "such insurance, medical service, or health plan or plans as encompassed by the law. A plan or program for any given geographical area should first be approved by the organized medical profession of that area."

The remainder of the resolution is recommended as written except that the word "provisions" be substituted for "intent" in the second "Resolved."

No. 44. Resolutions on American Medical Association Leadership in Distribution of Medical Care

Dr. Clarence I. Owen, for the Michigan State Medical Society, introduced the following resolutions, which were referred to the Reference Committee on Insurance and Medical Service.

The following resolution is offered at the direction of the house of delegates of the Michigan State Medical Society.

WHEREAS, The ever-increasing developments of scientific medical procedures combined with increasing population puts heavy responsibility on the American Medical Association as the leader in the distribution of medical care, and

WHEREAS, The American Medical Association is being constantly challenged by certain social, political, and medical groups in *developing* distribution methods to keep pace with our scientific advances, and

WHEREAS, Policies for distribution of medical and health care can best be established and carried out through the leadership of the medical profession itself, and

WHEREAS, It is the responsibility of the medical profession to make long-range plans, to advise the public of such plans, and to provide effective alternatives to compulsory health insurance proposals, therefore be it

Resolved, That as an aid to the officers, delegates and trustees of the American Medical Association an advisory commission be established by the House of Delegates of the American Medical Association to review the combined problems of health care distribution and to suggest plans for their solution, and be it further

Resolved, That such Commission should include the President of the American Medical Association, the Secretary and General Manager of the American Medical Association, who shall also serve as Secretary to the Commission, a past-president of the American Medical Association, and representatives from each of the following the Board of Trustees of the American Medical Association, the House of Delegates of the American Medical Association, the specialties, general practice, industry, labor, institutions of higher learning, medical schools, the executive branch of the federal government, prepaid medical care plans, prepaid hospital care plans, and such others as may be deemed appropriate, and be it further

Resolved, That such Commission be established with a rotating membership of five-year terms to serve without compensation but with reimbursement for necessary travel and other expenses, to meet at least semiannually, to select its own chairman and to submit progress reports to the officers and delegates of the American Medical Association before each regular annual and interim meeting of the American Medical Association, and be it also

Resolved, That the Board of Trustees of the American Medical Association be requested to provide the necessary funds for such Commission to carry out its functions.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. John K. Glen, Chairman, Texas, submitted the following report, which was adopted:

Resolution No. 44 on American Medical Association Leadership in Distribution of Medical Care.—Your reference committee feels that the machinery recommended by this resolution might well become a redundancy if insisted upon by the House of Delegates. It likewise feels that the present organization of the American Medical Association can be relied upon to retain leadership in the distribution of medical care. Your committee, therefore, recommends that this resolution be not approved.

No. 45. Resolution on Nonscientific Problems at Scientific Sessions of the American Medical Association

Dr. George W. Slagle, for the Michigan State Medical Society, introduced the following resolution, which was referred to the Reference Committee on Sections and Section Work:

The following resolution is offered at the direction of the house of delegates of the Michigan State Medical Society:

Whereas, Many problems other than scientific beset the various sections as presented in the Scientific Assembly of the American Medical Association; and

Whereas, Most of the nonscientific problems are basic to the distribution of all the medical sciences and are essential to medical welfare; therefore be it

Resolved, That the executive committee of the Scientific Assembly and the several section committees be urged by the House of Delegates of the American Medical Association to provide sufficient time at national meetings for discussion and deliberation concerning the distribution of medical care, of education, of legislation and of similar other subjects in relation thereto; such discussions and deliberations shall be conducted in the same manner as that employed in the scientific sessions, and the essential findings and conclusions shall be reported to the House of Delegates and to other appropriate bodies for consideration.

REPORT OF REFERENCE COMMITTEE ON SECTIONS AND SECTION WORK

Dr. H. Kenneth Scatliff, Chairman, Illinois, presented the following report, which was adopted:

Your Reference Committee on Sections and Section Work has had for its study Resolution No. 45 introduced by Dr. George W. Slagle, Michigan, entitled "Nonscientific Problems at Scientific Sessions of the American Medical Association."

Although Dr. Slagle did not appear before the committee, information from the Michigan delegation was brought to us concerning the resolution by two of their delegates, namely Drs. Hyland and Novy. Representatives from the Ohio delegation were also present and presented their viewpoints. Dr. Henry R. Viets, appearing for the Council on Scientific Assembly, gave a summary of that Council's extensive operation, pointing out that the Assembly has traditionally been the place for the dissemination of scientific information. Dr. Leonard W. Larson of the Board of Trustees called attention to the action of the Board in asking for a legal opinion and review to determine proper activities and functions of the scientific sections. Briefly, this opinion held that the fundamental concepts of the Scientific Assembly are to supply a forum for the discussion and dissemination of scientific information. Other matters have no place in its deliberation. Business and legislative interests are considered by the House of Delegates under powers provided for it in Division Three of the Bylaws.

Your committee recognizes the need for disseminating information concerning business and socioeconomic matters but would point out that such information is available in The Journal commencing in succeeding issues immediately after a meeting of the House.

It would further point out that the business sessions of all sections are free to discuss any and all nonscientific matters. Their desires in these matters can be brought to the House by resolution as late as the final meeting of the House of Delegates. This liberal provision in confined and is for the use only of the different sections.

It is therefore recommended by your committee that this resolution be disapproved.

No. 46. Resolutions on Death of Dr. Arthur C. Scott Jr.

Dr. Eli S. Jones, Indiana, introduced the following resolutions, which were adopted unanimously without referral to a reference committee:

Whereas, Dr. Arthur C. Scott Jr., of Temple, Texas, came to an untimely death on Feb. 23, 1956, and

Whereas, Dr. Scott for years served faithfully and capably in this House of Delegates, on the Special Committee on General Practice Prior to Specialization, on the Council on Medical Service, and in other responsible assignments; now therefore be it

Resolved, That this House of Delegates express its deep appreciation for the faithful work and friendly comradeship of Dr. Scott, and its sorrow at his passing; and be it further

Resolved, That a copy of this resolution be sent to the family of Dr. Scott.

No. 47. Resolutions on Nationwide Commission to Review Income Tax System

Dr. Milford O. Rouse, Texas, introduced for the Texas, New Mexico, New Jersey, and Maine delegations, the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

Preamble

The prodigious increase in the encroachment of federal power on the prerogatives of the several states and the every-day activities of individual citizens dates back to the constitutional amendment which made possible the levying of federal income taxes. With access to large sums of tax monies, came inevitable, tremendous increases in power. Tax authorities like T. Coleman Andrews are emphasizing, with real courage, the pressing need for a thorough study and review of the federal income tax system by an independent commission of qualified citizens selected on a nationwide basis. Physicians need to sponsor a movement for the creation of such a commission to acquaint taxpayers with the increasing threat to private enterprise and initiative; Now therefore be it

Resolved, That the House of Delegates of the American Medical Association recommends to the Congress of the United States the creation of such a nationwide commission to study the federal income tax system, with ample time for a thorough review, and with provision for full report and recommendations to the Congress and to the public; and be it further

Resolved, That a copy of this resolution be sent to the President of the United States, to the members of his cabinet, and to the members of the Congress.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. Willis H. Huron, Chairman, Michigan, read the following report, which was adopted:

Resolution 47 on Nationwide Commission to Review Income Tax System.—Your committee is in accord with the intent of this resolution. It recommends that this should be done on an individual basis, and that doctors, as individual citizens, use their efforts to support the creation of a nationwide commission to study the federal tax structure. Your committee recommends that this resolution, as amended, be adopted.

No. 48. Resolutions on Scholarship Aid

Dr. Edward J. McCormick, past-president, introduced on behalf of the Ohio State Medical Association, the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, The facilities for aid to young men and women who desire to study medicine and are in financial need are still inadequate in spite of the efforts of state medical associations and various foundations; and

Whereas, The parent body of American medicine, the American Medical Association, has no fund to aid these worthy individuals; therefore be it

Resolved, That this House of Delegates authorize the Board of Trustees to establish a rotating fund from which money can be loaned at a reasonable rate of interest to actual or prospective medical students; and be it further

Resolved, That the Board of Trustees be requested to appoint a screening committee to review and act upon any and all applications for scholarship aid and that the details regarding the use of this fund be in the hands of the Board of Trustees of the American Medical Association.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Joseph C. Griffith, Chairman, Wisconsin, read the following report, which was adopted:

Resolution No. 48 proposes that the Board of Trustees establish a rotating fund from which money may be loaned to prospective medical students. Mr. M. P. McQuillan and Mr. R. F.

Staudacher appeared before the committee and explained the Student American Medical Association Foundation, already incorporated. This provides for similar loans after the freshman year. Your committee commends these young men for their foresight and manner of procedure. As these two loan funds would cover virtually the same purpose, your committee proposes that this matter be referred to the Board of Trustees for its consideration.

No. 49. Resolution on *Opposition to Practice of Medicine* By Hospitals, Medical Schools, and Other Corporate Bodies

Dr. Edward B. Tuohy, *Section on Anesthesiology*, introduced the following resolution, which was *referred to the* Reference Committee on Insurance and Medical Service:

WHEREAS, *The specialty of anesthesiology* has repeatedly gone on record as opposing the practice of medicine by hospitals, medical schools, and other corporate bodies through full time employees; and

WHEREAS, *This subject is scheduled for discussion* by the House of Delegates of the American Medical Association now in session; therefore *be it*

Resolved, That the Section on Anesthesiology of the American Medical Association reaffirms this position and instructs its delegate to present and *support its views before the House of Delegates.*

NOTE: The Reference Committee on Insurance and Medical Service made no report concerning Resolution No. 49.

No. 50. Resolutions on High School Science Fairs

Dr. Wendell C. Stover, on behalf of the Indiana State Medical *Association, introduced the following resolutions*, which were referred *to* the Reference Committee on Legislation and Public Relations:

WHEREAS, The American Medical Association through its Department of Public Relations has recommended to the constituent state and component county medical societies that they consider active participation in the National *High School Science Fairs*; and

WHEREAS, The Indiana State Medical Association and its component county societies accepted this recommendation as one of sound purpose; and

WHEREAS, The experience of our *State in the 1955 Science Fair program* has proved worth far more than its cost, from a public relations standpoint; and

WHEREAS, *The sincere letters of appreciation from* students, teachers, school officials and the public *evidenced an entirely new perception of our* medical *organization; now therefore be it*

Resolved, That *the American Medical Association* and its Department of Public Relations be complimented by this House for encouraging the participation *by medical organizations in this National High School Science Fair project; and be it further*

Resolved, That the American Medical Association, through *its appropriate* departments and Councils continue to use every resource at its command *to bring* the whole of organized medicine into active participation in this *worthwhile* and constructive program to encourage *the youth of our nation* to take a serious interest *in the field of science as their career.*

REPORT OF REFERENCE COMMITTEE ON *LEGISLATION AND PUBLIC RELATIONS*

Dr. Willis H. Huron, Chairman, Michigan, submitted the following report, which was adopted:

Resolution No. 50 on High School Science Fairs.—Your committee approves heartily of this resolution, and commends the delegation from Indiana for bringing this to the attention of the *House of Delegates.* Your committee recommends its adoption.

No. 51. *Resolutions on* Associations with Optometrists

Dr. W. L. Benedict, for the Section on *Ophthalmology, introduced* the following resolutions, which were referred to the Reference Committee on Medical Education and Hospitals:

WHEREAS, The Judicial Council has pointed *out in its report to the* House of Delegates at the December, 1955, meeting that voluntary associations with optometrists are unethical; and

WHEREAS, *It has come* to the attention of the Section on Ophthalmology that optometrists are associated with hospitals, clinics, and other medical *agencies in their capacity as optometrists; therefore be it*

Resolved, That the hospitals and other agencies so concerned be informed of the position of the American Medical Association in this matter; and be it further

Resolved, That the *report of the reference* committee and the action of the House be communicated to all state and county medical societies.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. George S. Klump, Chairman, Pennsylvania, submitted the following report, which was adopted:

Resolution No. 51.—Your reference committee has considered this resolution and, after discussion with its proponents, who agree with your committee, suggests that the first "resolved" be deleted and the second "resolved" amended, so that the resolution will then read:

Resolved, That the report of the action of the House of Delegates of the *American* Medical Association be communicated to all constituent state associations.

No. 52. Resolution on Status of Practice of Optometry

Dr. W. L. Benedict, *Section on* Ophthalmology, introduced the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws:

Resolved, That the proper American Medical *Association authorities* inquire into the current status of the *practice of optometry* to determine whether *optometry is in fact* a cult or a sectarian method of the practice of medicine.

REPORT OF REFERENCE COMMITTEE ON *AMENDMENTS TO THE CONSTITUTION AND BYLAWS*

Dr. Jay J. Crane, Chairman, *Section* on Urology, read the following report, which was adopted:

Resolution No. 52.—Your reference committee has had referred to it Resolution No. 52 introduced by Dr. William L. Benedict for the Section on Ophthalmology. The resolution asks that "the proper American Medical Association authorities inquire into the *current status of the practice of optometry to determine* whether optometry is in fact a cult or a sectarian method of the practice of medicine." Your committee has been informed that some months ago the Judicial Council requested the Law Department of the American Medical Association to make a thorough study of all phases of the practice of optometry. That study is now nearing completion. Your committee, therefore, recommends that this resolution be not approved at this time pending a report on the current study.

No. 53. Resolution on 1961 American Medical Association Annual Meeting

Dr. Floyd S. Winslow, New York, introduced the following resolution, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

WHEREAS, Several annual meetings of the American Medical Association have been held in New York City with outstanding success; and

WHEREAS, New and remarkable *facilities for such a meeting* are now available; and

WHEREAS, *The House of Delegates* of the Medical Society of the State of New York has enthusiastically *voted to invite* the American Medical Association to hold its 1961 Annual Meeting in New York City; *therefore* be it

Resolved, That this House of Delegates recommends to the Board of Trustees that the 1961 Annual Meeting be held in New York City.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Dr. Woodruff L. Crawford, Chairman, Section on Pediatrics, submitted the following report, which was adopted:

Resolution No. 53.—Your reference committee has revised the "resolved" portion of this resolution, as follows:

Resolved, That this House of *Delegates recommends that the* Board of Trustees seriously consider holding the 1961 Annual Meeting in New York City.

Your committee recommends approval of the resolution as amended.

No. 54. Resolution on Physical Examinations

Dr. Rutherford T. Johnstone, for the *Section* on Preventive Medicine, introduced the following resolution, which was referred to the Reference Committee on *Hygiene*, Public Health, and Industrial Health:

WHEREAS, *It has* long been recognized that the *health of the* employee is an economic as well as human relations concern of the *employer*; and

WHEREAS, Preventive medicine is actively concerned in maintaining the economic productiveness of said employee; and

WHEREAS, It has been recognized that periodic physical examinations will contribute to the health of the nation and aid in the early recognition of disease; therefore be it

Resolved, That periodic physical examinations provided by the employer are within the province of the said employer, and do thereby provide a basis for a private enterprise approach to the health maintenance needs on a broad base for American citizens.

REPORT OF REFERENCE COMMITTEE ON HYGIENE, PUBLIC HEALTH, AND INDUSTRIAL HEALTH

Dr. Martyn A. Vickers, Chairman, Maine, read the following report, which was adopted:

Resolution No. 54 on Physical Examinations.—As this resolution involves many fundamental principles, such as patient-doctor relationship, free choice of physician, and rights of employee as well as employer, your committee recommends that it be referred to the Board of Trustees for a report at the interim meeting in Seattle.

Report from Student American Medical Association

The Speaker presented to the House the two delegates from the Student American Medical Association, Mr. J. Kent Guild of Northwestern University Medical School, President, and Mr. Michael P. McQuillen of Georgetown University School of Medicine, Vice-President.

Mr. Guild made the following address, during which he presented a SAMA check for $5,000:

Mr. Speaker, Members of the House of Delegates, and Guests: It is a pleasure and an honor to be here this afternoon and represent the Student American Medical Association. As some of you know, our organization was founded under the auspices of the American Medical Association in 1950 and became autonomous in 1955. Our delegate stated before this House two years ago, "The fathers who support most of the medical students in the country today must be extremely envious of the American Medical Association in having an offspring, at the age of four, that is assuming its own financial responsibilities." This year, your offspring, at the age of six, would like to return a portion of your investment in him. Just as you were happy to loan us capital in the beginning, likewise we are happy to be able to return to you at this time this third installment of $5000. bringing the total repaid to $20,000 for a three-year period. We know that this is not a sizable check, considering the one you received on Monday, but it means a lot to us, and we are very happy to be able to return these funds to you.

During the past year, SAMA has reached new heights in several fields. In size, our membership has increased until it now exceeds 30,000. Three new chapters have raised the total of active chapters to 72 out of the 82 medical schools, and the circulation of the *SAMA Journal* now exceeds 50,000. Increased size is not our immediate goal. Instead, we consider it to be an index of the moral success in fulfilling our purpose.

During our convention this spring, we certainly appreciated the aid and participation of many of your members. The opinions and clarifications which were forthcoming from your representatives both stimulate and facilitate our knowledge of problems common to both the American Medical Association and the Student American Medical Association. For example, SAMA, in expressing the needs of many interns, has resolved that it has and still does agree wholeheartedly with the Council on Medical Education and Hospitals in its definition of the ideal milieu of graduate medical education as that in which "the education benefits to the trainee are considered of paramount importance, with the service benefits of the milieu of secondary importance." However, with your guidance, we proposed to advance one step further in this philosophy and define an ideal minimum for internships as "the optimal educational advantage plus the economic possibility of enjoying this advantage."

Next spring, our convention will be held in Philadelphia. Although the location is different, we sincerely hope that you will again participate with us. Perhaps the biggest news that we have to present concerns the SAMA Foundation, about which the following speaker, Mr. McQuillen, will address you.

The objects of our association are "to advance the profession of medicine, to contribute to the education and welfare of medical students, to familiarize its members with the purposes and ideals of organized medicine, and to prepare its members to meet the social, moral, and ethical obligations of the medical profession." We are proud of our progress thus far, and with confidence and with your guidance, we look forward to the future.

Mr. McQuillen addressed the House as follows:

Mr. Speaker, President Murray, Members of the House of Delegates: It is a distinct honor and privilege that has been accorded me this morning to speak to this House on a matter that has been deemed by your Board of Trustees as a most noteworthy project. This matter is the Student American Medical Association Foundation.

In recent years, the pulse of economic pressure has beaten with an ever-increasing and more alarming fullness in the period preparatory to medical practice to the detriment of medicine in general. Applications for medical schools are falling off from the young man who might tomorrow become a leader in medicine, but who today cannot see his way clear to entering upon a long period of training under economic duress both to himself and to his family. The old "sour grapes" that medicine is a closed profession, open only to the sons and daughters of rich men, is being thrown in our faces once again. Oh, yes, there are some funds available to alleviate this situation of a very inadequate and most unevenly distributed nature, but in large part these either require collateral or co-signers or endorsers to such a degree that if possessed would make the loans themselves unnecessary; or they require the young medical student to signify his intention to practice in a certain type of practice in a certain locality, which is a situation that no medical student in the early stages of his training is either capable or desirous of making.

The need, then, has been for a foundation which would offer loans to students of approved medical schools on the basis of need and of character and of scholastic merit alone. We were most happy last June to report to this House our intention of fulfilling this need, and we are happier still to announce at this time that the Student American Medical Association Foundation has been established as a separate, distinct, self-perpetuating philanthropy of the Student American Medical Association under the trusteeship of the Continental Illinois National Bank and Trust Company of Chicago. It is our firm hope that this foundation will have sufficient funds, and by sufficient funds we mean at least $100,000, by September of this year, the opening of the fall term, in order to offer to each of the approved medical schools one or two loans of $500 to $1,000 each. The need was expressed to us very clearly by the delegates to our convention in May, each of whom brought with him many inquiries from his constituent members as to when the foundation would be available to loan funds to the students in his school, and documented proof of this need will be offered as soon as we may offer the loans to the schools.

We are searching in several directions for funds to make these loans available. We are approaching the various pharmaceutical firms that in the past have shown a kindly interest in improving the standard of medical practice. We are approaching many of the foundations which have given grants to further medical education. We are hoping that individual doctors themselves who may have either lived under this sort of economic duress, or who may appreciate the economic duress that we today must live under, will assist and give one-time self-perpetuating grants to our foundation.

Finally, and most important of all, we are approaching organized medicine, both on a national and state and county level. As an aside, I might offer thanks at this moment to Mrs. Mason Lawson and to her organization, the Woman's Auxiliary to the American Medical Association, for their kind gift announced on Monday. It is our firm hope that the charity of these various groups that we are approaching will be of sufficient degree to demonstrate in a mute, silent, yet most eloquent way, their faith in the future of medicine and their desire to improve and insure that future.

Presentation to Dr. Dwight H. Murray

Dr. Robertson Ward, California, was given the privilege of the floor for the purpose of presenting to President Dwight H. Murray a framed resolution signed by Drs. Sidney J. Shipman and Albert Daniels, president and secretary of the California Medical Association, which had been unanimously adopted by the house of delegates of the California association on April 29, 1956.

Dr. Ward read the following resolution:

WHEREAS, The California Medical Association's own beloved and respected Dr. Dwight H. Murray of Napa, Calif., currently President-Elect of the American Medical Association, will soon become President of the American Medical Association; and

WHEREAS, Dr. Murray has attained his high honor because of his life-long devotion to the ever-advancing standards of medical care for the people of his state and nation and the welfare of his confreres; now therefore be it

Resolved, That the California Medical Association, duly meeting in convention, convey to Dr. Murray our best wishes for a year of successful leadership for American medicine.

Supplementary Report of Council on Medical Service

Dr. Joseph D. McCarthy, Chairman, presented the following supplementary report, which was referred to the Reference Committee on Miscellaneous Business:

COMMITTEE ON GERIATRICS

The Council on Medical Service, at the suggestion of its Committee on Geriatrics, recommends to the House of Delegates that the name of this committee be changed to the Committee on Aging. It is believed by the committee and the Council, after considerable discussion relative to the objectives of the committee, that the title Committee on Aging would be preferable and would more clearly describe the scope of activities of the committee.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Joseph C. Griffith, Chairman, Wisconsin, read the following report, which was adopted:

A supplementary report of the Council on Medical Service requesting that the name of its Committee on Geriatrics be changed to the Committee on Aging has been considered. Your reference committee agrees and so recommends.

Greetings to Canadian Medical Association

The House of Delegates voted, at the suggestion of the Vice Speaker, to send a telegram of greetings to the Canadian Medical Association now in session.

Remarks on the American Medical Education Foundation

The Speaker obtained the privilege of the floor for Dr. Norman L. Sheehe, second vice-president of the Illinois State Medical Society, in order to present remarks prepared by Dr. Edward H. Weld of Rockford, Ill., past-president of the Illinois society, as follows:

Mr. Speaker, Members of the House of Delegates and Friends: I am here to speak on the contributions made to the American Medical Education Foundation by the members of the Illinois State Medical Society during the past three and a half years. In 1953, the house of delegates of the Illinois State Medical Society voted to increase the annual dues of the membership and to instruct the council of the society to allocate $20 from each member's dues to the AMEF.

I was a strong opponent of this plan from the very beginning, and some of the other members shared my views. It was our eling that this was a compulsory assessment and undemocratic ts concept. Our opposition was based primarily on what we rded as compulsory dues deduction, and not because of any ing that doctors could not afford to contribute to the support their medical schools. We realized that doctors never fully pay for their medical education and that the least they can do is to make up for this after they go into practice by contributing to the support of their schools. Those of us who were against the Illinois plan thought that if we were to have compulsory assessments for the AMEF, *then* similar assessments should be made in other states.

I was amazed at a report given recently by Mr. John Hedback, Executive Secretary of the American Medical Education Foundation. Although the proponents of the Illinois plan had expressed the belief that other states would adopt similar methods of raising funds for our medical schools, the report showed that few states had followed suit. During the past year, I believe, one state was added to the list and one was dropped.

As you all know, the AMEF solicits contributions from within the medical profession while another group, the National Fund for Medical Education, seeks medical school support from business and industry sources. Since the establishment of these two fund-raising agencies in 1951, a total of nearly 10 million dollars has been donated through them for the support of the nation's medical schools. Of the monies raised within the medical profession, 45% came by grant from the American Medical Association. This amounts to $2,100,000. During the same period the Illinois State Medical Society contributed a total of $621,900, California gave $302,000, New York came up with $205,000, Pennsylvania $194,000, Indiana $158,000, Ohio $100,000 and New Jersey $76,000. Now I have had cause to study these figures carefully in the light of a plan I opposed bitterly. It became apparent that unless something along the line of the Illinois plan was adopted by all other state medical organizations, total contributions to AMEF would continue to be relatively unimpressive. I realize now that something must be done to approach this problem with new vigor.

I wish to state here that I have been wrong in my opposition to the Illinois plan for contributing to the AMEF and that I believe the Winnebago County Medical Society, of which I am a member, has been wrong in consistently voting against the $20 dues allocation.

We firmly believe that the medical schools need even stronger support from the medical profession and that the Illinois plan definitely proves that this is the most effective way to raise the funds. The comparable figures on state contributions to AMEF bear me up on this score. The seed has been planted, I am here to see that it is properly nurtured. We must get more money from individual state societies for our medical schools and I am convinced that the Illinois way is the best way to do the job. Since I was so strong originally in my misguided opposition to the plan, I want now to back with equal strength any effort that would cause other state societies to adopt this method of raising funds for the AMEF. The wonderful work that the Ford Foundation is now doing in behalf of medical education, with its fund matching program, should make all physicians want to increase their own personal contributions.

Gentlemen, I am completely sold on the Illinois plan and I know that it is the hope of my society that your respective organizations find merit in such a fund-raising procedure. I urge the American Medical Education Foundation to sell the Illinois plan to other states even as you have sold it to me. It can be done. And now God bless you one and all. Let's keep American medicine free from federal control.

The Speaker stated that the remarks on the American Medical Education Foundation would be considered as informative, and the Secretary was directed to deliver a copy to the Board of Trustees for its information and action.

Election of Officers

The following officers were elected:

President-Elect: Dr. David B. Allman, Atlantic City, N. J

Vice President: Dr. Franklin S. Crockett, West Lafayette, Ind

Secretary Dr. George F. Lull, Chicago.

Treasurer. Dr. J. J. Moore, Chicago.

Speaker, House of Delegates. Dr. E. Vincent Askey, Los Angeles

Vice Speaker, House of Delegates: Dr. Louis M. Orr, Orlando Fla

Members, Board of Trustees: Dr. Julian P. Price, Florence, S C, Dr Hugh H Hussey Jr., Washington, D.C

Member, Judicial Council: Dr. Robertson Ward, San Francisco

Members, Council on *Medical Education* and Hospitals Dr Guy A Caldwell, New Orleans, Dr. John W. Cline, San Francisco

Members, Council on Medical Service Dr. Carlton E Wertz, Buffalo Dr. John Flack Burton, Oklahoma City, Dr. Thomas J Danaher, Torrington Conn ; Dr. Raymond M. McKeown, Coos Bay, Ore , Dr J Lafe Ludwig Los Angeles.

Member, Council on Constitution and Bylaws Dr Walter E Vest Huntington, West Va

Remarks of President-Elect David B. Allman

The newly elected President-Elect, Dr. David B. Allman, was escorted to the rostrum, and addressed the House as follows

Mr. Speaker, Members of the House of Delegates, Friends Today you have conferred upon me the greatest honor of my life. My reaction is one of delight. I am delighted by this thrilling demonstration that you have made today and by the confidence that you have placed in me. I am humbled by my awareness of the great task and the magnitude of the duties which go with this office, but on my part I sincerely thank you and from my heart I pledge to give the best that is in me to serve the medical profession of this country and the people of this nation, to the best of my ability and faithfully, and, with your assistance and with your guidance and with the help of God, I *will not fail you.*

Election of Affiliate Members

The following persons were elected to Affiliate Membership in the American Medical Association:

Physicians of adjacent countries nominated by the Judicial Council:

Dr. George I. Bernstein, Windsor, Ont., Can.
Dr. Gustave Gingras, Montreal, Can.
Dr. Samuel E. C. Turvey, Vancouver, B. C., Can.

American medical missionaries, nominated by the Judicial Council:

Dr. William J. Barnett, Brooklyn, N. Y.
Dr. Robert C. Bowers, Wema, Equateur Province, Belgian Congo, West Africa.
Dr. Richard S. Buker, New York.
Dr. Almarose Cooke, Wheaton, Ill.
Dr. Erwin J. Cummins Jr., Minna, Nigeria, West Africa.
Dr. Donald C. Edwards, Gombe, North Nigeria, West Africa.
Dr. Arthur E. Geschke, Rangoon, Burma.
Dr. H. Wallace Greig, Batouri, Cameroun, Africa.
Dr. Marion D. Hursh, Kano, Nigeria, West Africa.
Dr. Shukry D. Karmy, Baghdad, Iraq.
Dr. Alfred O. Mazat, Singapore, C. S.
Dr. Albert J. Patt, Vellore, Madras State, South India.
Dr. Oliver J. Pogue, Georgetown, British Guiana.
Dr. Douglas B. Reitsma, Brooklyn, N. Y.
Dr. Doris J. H. Wilson, Hartford, Conn.
Dr. Harry R. Zemmer, Bukavu, Belgian Congo, West Africa.

Scientists allied to medicine nominated by the Section on Experimental Medicine and Therapeutics:

Dr. Roger A. Lewis, Bombay, India.
Dr. A. J. Plummer, Summit, N. J.
Albert Schatz, Ph.D., Farm School P.O., Bucks County, Pa.

American Medical Education Foundation Awards of Merit

Dr. Louis H. Bauer, President of the American Medical Education Foundation announced that an Award of Merit had been conferred on each of the following-named organizations and persons, who had contributed more than $1,000 during the past year:

American Medical Association
Arizona Medical Association
California Medical Association
Illinois State Medical Society
Iowa State Medical Society
Massachusetts Medical Society
Medical Society of New Jersey
Oregon State Medical Society
Tennessee State Medical Association
Utah State Medical Association
Medical Society of Virginia
American College of Anesthesiologists
American College of Radiology
Dr. W. W. Bauer

Report of Reference Committee on Rules and Order of Business

Dr. Herbert H. Bauckus, Chairman, New York, presented the following report, which was adopted unanimously:

On behalf of the Reference Committee on Rules and Order of Business, I am pleased to offer the following resolution:

Resolved, That this House of Delegates hereby make known its sincere and admiring appreciation for that which has been done to make the meeting we are soon to conclude very pleasant and successful.

Therefore, we make grateful acknowledgment to the General Chairman, Dr. Maurice M. Hoeltgen, and the Co-Chairmen, Drs. Percy E. Hopkins, F. Garm Norbury, and Joseph T. O'Neill, and the members of their committee.

We acknowledge with thanks the work of the Secretary, Dr. George F. Lull, and his very efficient staff who perform their task most faithfully as do the Speaker and Vice Speaker, Drs. E. Vincent Askey and Louis M. Orr. We thank the Subcommittee on Woman's Auxiliary, Mrs. Leonard J. Houda, Chairman.

We note with appreciation the Illinois State Medical Society and the Chicago Medical Society, thanking them for their most gracious kindness and entertainment. Thanks are extended to the management of the Palmer House and to the Searle Company for a very fine luncheon. We thank those who have made possible our scientific meetings and exhibits.

There are many who contribute to this Annual Meeting of the American Medical Association, and their zeal in so doing will aid us in carrying on as we return to our state and county associations.

Remarks of Vice President F. S. Crockett

The newly elected *Vice President, Dr. F. S. Crockett,* addressed the House as follows:

Mr. Speaker, Members of the House of Delegates: I want you to know how very much I appreciate this very high honor you have given me. I welcome this opportunity for further service to our profession, to our medical association, and to the public we serve.

The House of Delegates adjourned, sine die, at 5:05 p. m., Thursday, June 14, 1956.

MINUTES OF THE SCIENTIFIC SECTIONS

SECTION ON ANESTHESIOLOGY

The Section on Anesthesiology met on Tuesday, Wednesday, and Thursday afternoon, June 12, 13, and 14, 1956, in the Tally Ho Room of the Sheraton Hotel.

Dr. John S. Lundy, Chairman, Rochester, Minn., presided over the meeting on Tuesday and Thursday afternoon, and the Vice-Chairman, Dr. Lewis H. Wright, New York, over the Wednesday afternoon meeting.

All of the papers listed on the official program of the Section were read by the proper authors and were discussed by those named for that purpose.

At a business meeting held on Tuesday, June 12, a report was made by the Section delegate, Dr. Edward B. Tuohy, Los Angeles, concerning actions of the House of Delegates of the American Medical Association, and Dr. Stuart C. Cullen, Iowa City, Section representative to the American Board of Anesthesiology, reported concerning the work of the Board. Members of the Section who had exhibits in the Scientific Exhibit were introduced. A letter submitted by Dr. Ralph M. Tovell, former Chairman of the Section, with respect to career residencies in Veterans Administration hospitals, was referred by vote of the Section to the Council on Medical Education and Hospitals. Two resolutions were introduced and referred to the delegate, Dr. Tuohy, for consideration for presentation in the House.

Note: One of these resolutions, No. 49, will be found in the abstract of the Proceedings of the House of Delegates in the Oct. 6 issue of The Journal.

On Thursday, June 14, the following officers were elected: *Chairman, Dr. Scott M. Smith,* Salt Lake City; Vice-Chairman, Dr. Richard H. Barrett, Hanover, N. H.; delegate, Dr. Edward B. Tuohy, Los Angeles; alternate delegate, Dr. Urban H. Eversole, Boston; representative to the Scientific Exhibit, Dr. Edwin L. Rushia, Augusta, Ga. The Chairman and Vice-Chairman were elected to serve for the ensuing year, the delegate and alternate delegate for two-year-terms beginning Jan. 1, 1957, and the representative to the Scientific Exhibit for the ensuing two years. The Secretary of the section, Dr. Daniel C. Moore of Seattle, was elected at the Atlantic City Annual Meeting in June, 1955, for a three-year term ending at the close of the Annual Meeting in 1958.

SECTION ON DERMATOLOGY

The Section on Dermatology held its meetings on Tuesday, Wednesday, and Thursday afternoon, June 12, 13, and 14, 1956, in the ballroom of the Knickerbocker Hotel.

At the meetings on Tuesday and Wednesday, the Chairman, Dr. J. Walter Wilson, Los Angeles, presided over half the sessions and Dr. Ruben Nomland, Vice-Chairman, Iowa City, over the other half. Dr. Nomland presided over the session on Thursday afternoon.

Dr. Herbert Rattner. Chicago, presented a report as Chief Editor of the *A. M. A. Archives of Dermatology*; Dr. Samuel Bluefarb. Chicago. submitted his report as representative to the Scientific Exhibit; a report on the American Board of Dermatology was presented by Dr. Marcus Caro, Chicago; and Dr. Robert R. Kierland. Section delegate. read a report outlining actions taken at the current session of the House of Delegates. Dr. George M. Lewis. New York. submitted the report of the nominating committee. which was laid on the table for action on June 14. These reports were presented at the business meeting of the Section on Tuesday, June 12.

All papers were presented and discussed by authors and discussors as listed in the official program.

The following officers were elected on Thursday. June 14: Chairman. Dr. Herbert Rattner, Chicago. and Vice-Chairman, Dr. Frederick M. Jacob, Pittsburgh, for the ensuing year; delegate, Dr. Winfred A. Showman, Tulsa, Okla., and alternate delegate, Dr. Maurice J. Costello, New York, for three-year terms beginning Jan. 1, 1957; representative to the Scientific Exhibit, Dr. Stanley E. Huff, Evanston, Ill., for the ensuing three years. The Secretary, Dr. Clarence S. Livingood, Detroit, was elected at the Atlantic City Annual Meeting in 1955, for a three-year term to end in 1958. Representatives to the American Board of Dermatology also were elected: Dr. Beatrice M. Kesten, New York, for a three-year term, and Dr. Walter Lobitz, Hanover, N. H., for two years to fill the unexpired term of Dr. George M. Lewis, New York.

SECTION ON DISEASES OF THE CHEST

Two meetings of the Section on Diseases of the Chest were held in the Ballroom of the Knickerbocker Hotel on Wednesday and Thursday morning, June 13 and 14, 1956, the second meeting being held jointly with the Section on Radiology. The third meeting of the Section was a joint session with the Section on General Practice in the Gold Coast Room of the Drake Hotel on Friday morning, June 15.

The business meeting of the Section took place on Wednesday morning, June 13, and Dr. John F. Briggs, St. Paul. Minn., Secretary, served as Chairman in the absence because of illness of Dr. Edgar T. Mayer, New York, who had been appointed Chairman subsequent to the 1955 meeting on the resignation of the regularly elected Chairman, Dr. Edward W. Hayes of Monrovia, Calif.

At the business meeting, the following officers were elected: Chairman. Dr. John F. Briggs, St. Paul. Minn., and Vice-Chairman. Dr. M. Jay Flipse, Miami, Fla., for the ensuing two years; Secretary, Dr. Burgess L. Gordon, Philadelphia, for the ensuing five years: delegate, Dr. Hollis E. Johnson, Nashville, Tenn., and alternate delegate, Dr. J. Winthrop Peabody, Washington, D. C., for two-year terms beginning Jan. 1, 1957, representative to the Scientific Exhibit, Dr. Edwin R. Levine, Chicago, for the ensuing three years.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

The Section on Experimental Medicine and Therapeutics held an executive committee meeting at 7:30 a. m., Tuesday, June 12, 1956, in Room 12 at the Palmer House. Drs. Thomas Findley, Harry F. Dowling, Edgar V. Allen, and George E. Burch were in attendance. The problems of the Section and the candidates for offices were discussed. In addition it was decided to continue meeting in conjunction with the Section on Internal Medicine on the fourth day of the Annual Meeting.

The sessions of the Section were held in the ballroom of the Sheraton Hotel on Tuesday, Wednesday, and Thursday morning, June 12, 13, and 14, the Thursday morning session being a joint meeting with the Section on Internal Medicine.

At the business meeting on Wednesday, June 13, the following officers were elected: Chairman, Dr. Harry F. Dowling, Hinsdale, Ill., and Vice-Chairman, Dr. George E. Burch, New Orleans, for the ensuing year; Secretary, Dr. Elliott V. Newman, Nashville, Tenn., for the ensuing three years. The terms of Drs. Edgar V. Allen, Rochester, Minn., and Robert D. Taylor, Marshfield, Wis., delegate and alternate delegate respectively, do not expire until Dec. 31, 1958. The same is true with respect to the term of Dr. Joseph F. Ross, Los Angeles, representative to the Scientific Exhibit.

Dr. Thomas Findley, Chairman, presided over the Section meetings on Tuesday and Wednesday, and the papers and discussions were presented as listed in the official program.

SECTION ON GASTROENTEROLOGY AND PROCTOLOGY

Meetings of the Section on Gastroenterology and Proctology were held on Tuesday, Wednesday, and Thursday afternoon. June 12, 13, and 14, 1956, in the University of Illinois Gymnasium on Navy Pier, the session on Thursday being a joint meeting with the Section on Pathology and Physiology.

The following officers were elected at the business meeting on Wednesday, June 13: Chairman, Dr. Robert A. Scarborough, San Francisco, Vice-Chairman, Dr. Everett D. Kiefer. Boston, and Secretary, Dr. William H. Dearing, Rochester, Minn., for the ensuing year: delegate, Dr. Stuart T. Ross, Garden City, N. Y., and alternate delegate, Dr. Garnet W. Ault, Washington, D. C., for two-year terms beginning Jan. 1, 1957. Drs. Willard H. Bernhoft, Buffalo, and George G. McHardy, New Orleans. were elected representatives to the Scientific Exhibit for the ensuing year.

SECTION ON GENERAL PRACTICE

The Section on General Practice met in the Gold Coast Room of the Drake Hotel on the mornings of Tuesday, Wednesday, and Thursday, June 12, 13, and 14, 1956. The Thursday morning session was a joint meeting with the Section on Diseases of the Chest. All three meetings were presided over by Dr. I. Phillips Frohman, Washington, D. C., Chairman of the Section on General Practice.

Dr. Lester D. Bibler, Indianapolis, Section delegate, presented a comprehensive report of actions of the House of Delegates at the Boston Interim Meeting and of his own activities in the interest of the Section.

Papers were presented as listed in the official program with the exception of one presentation scheduled for the joint meeting. the author being unable to attend because of official duties elsewhere.

Officers were elected at the business meeting on Wednesday, June 13, as follows: Chairman, Dr. George L. Thorpe, Wichita. Kan., and Vice Chairman, Dr. Charles E. McArthur, Olympia. Wash., for the ensuing year; delegate, Dr. Lester D. Bibler. Indianapolis, and alternate delegate, Dr. Milton B. Casebolt. Kansas City. Mo., for two-year terms beginning Jan. 1, 1957; representative to the Scientific Exhibit. Dr. I. Phillips Frohman, Washington. D. C., for the ensuing year. The Secretary, Dr. Eugene I. Baumgartner, Oakland, Md., was elected in 1954 for a four-year term ending in 1958.

SECTION ON INTERNAL MEDICINE

A luncheon meeting of the past chairmen, the present executive committee, and the trustees of the Billings Fund of the Section on Internal Medicine was held at the Sheraton Hotel on Tuesday, June 12, 1956. Those present were Drs. Henry M. Thomas Jr., Walter L. Bierring, Charles T. Stone Sr., Ovid O. Meyer, Walter L. Palmer, Roy W. Scott, and A. Carlton Ernstene. Minutes of the executive committee meeting on June 8, 1955. were approved, and it was noted that Dr. Jerome W. Conn. who had been elected representative to the Scientific Exhibit, was unable to accept, and that Dr. Henry T. Ricketts, Chicago, was appointed in Dr. Conn's place.

The scientific meetings of the Section were held on Tuesday, Wednesday, and Thursday afternoon, June 12, 13, and 14, in the Ballroom of the Sheraton Hotel, the third session being a joint meeting with the Section on Experimental Medicine and Therapeutics. Dr. Henry M. Thomas Jr., Baltimore, Chairman, Section on Internal Medicine, presided over the three sessions except for the latter half of the joint meeting when Dr. Ovid O. Meyer, Madison, Wis., Vice-Chairman of the Section on Internal Medicine, assumed the chair. All papers and discussions thereon were presented as listed in the official program.

The following officers were elected at the business meeting on June 13: Chairman, Dr. A. Carlton Ernstene, Cleveland, Vice-Chairman, Dr. Paul B. Beeson, New Haven, Conn., and representative to the Scientific Exhibit, Dr. Henry T. Ricketts, Chicago, for the ensuing year; delegate, Dr. Charles T. Stone Sr., Galveston, Texas, and alternate delegate, Dr. Richard B. Capps, Chicago, for two-year terms beginning Jan. 1, 1957. There were no vacancies on the board of trustees of the Billings Fund. The present trustees are the members of the executive committee of the Section on Internal Medicine and Drs. Walter L. Bierring, Truman G. Schnabel, and Walter L. Palmer. Dr. Robert Loeb, New York, was selected to deliver the Billings Lecture in 1957, and Drs. John R. Paul, New Haven, Conn., and Sidney Burwell, Boston, were chosen first and second alternate respectively.

SECTION ON LARYNGOLOGY, OTOLOGY, AND RHINOLOGY

The Section on Laryngology, Otology, and Rhinology met in Thorne Hall of Northwestern University on Tuesday, Wednesday, and Thursday morning, June 12, 13, and 14, 1956.

Dr. John R. Lindsay, Chicago, Chairman, presided over the meetings, and all papers were read and discussed as presented in the Official Program.

The delegate of the Section, Dr. Gordon F. Harkness, Davenport, Iowa, also Honorary Chairman of the Section, presented a report on his work as a member of the House of Delegates.

At the business meeting of Thursday, June 13, the following officers were elected: Chairman, Dr. Gordon D. Hoople, Syracuse, N. Y., Vice-Chairman, Dr. Kenneth L. Craft, Indianapolis, and representative to the Scientific Exhibit, Dr. Walter E. Heck, San Francisco, for the ensuing year; Secretary, Dr. Hugh A. Kuhn, Hammond, Ind., for a term of three years ending in 1959. The delegate, Dr. Gordon F. Harkness, Davenport, Iowa, and the alternate delegate, Dr. Dean Lierle, Iowa City, were elected in 1955 for two-year terms ending Dec. 31, 1957.

SECTION ON MILITARY MEDICINE

The meetings of the Section on Military Medicine were held in the Cinema Theater on Tuesday, Wednesday, and Thursday morning, June 12, 13, and 14, 1956, and were presided over by the Chairman, Dr. H. Lamont Pugh, Bethesda, Md.

All of the papers, and discussions thereon were presented as listed in the official program.

At the business meeting on Wednesday, June 13, officers were elected as follows: Chairman, Dr. Russel V. Lee, Palo Alto, Calif.; Vice-Chairman, Dr. Silas B. Hays, Washington, D. C.; secretary, Dr. Cecil L. Andrews, Washington, D. C.; representative to the Scientific Exhibit, Dr. Frank M. Townsend, Washington, D. C. All of the foregoing officers were elected to serve for the ensuing year. The delegate, Dr. Charles L. Leedham, Cleveland, and the alternate delegate, Dr. Charles P. Campbell, Hackensack, N. J., were elected in 1955 for two-year terms ending Dec. 31, 1957.

SECTION ON MISCELLANEOUS TOPICS

Session on Allergy

A Session on Allergy was held in the Section on Miscellaneous Topics on the morning of Thursday, June 14, 1956, in the Walton Room of the Drake Hotel.

Drs. Stanley F. Hampton, St. Louis, and Lawrence J. Halpin, Cedar Rapids, Iowa, Co-Chairmen, presided over the session. The papers as listed in the official program were presented, and some were discussed from the floor.

SECTION ON NERVOUS AND MENTAL DISEASES

The Section on Nervous and Mental Diseases met on Tuesday, Wednesday, and Thursday morning, June 12, 13, and 14, 1956, in the ballroom of the Drake Hotel.

Dr. Lee M. Eaton, Rochester, Minn., Chairman, presided. All of the papers listed on the official program were read by the proper authors and were discussed by those named for that purpose.

The business meeting of the Section took place on Wednesday, June 13, and the following officers were elected: Chairman, Dr. Karl O. Von Hagen, Los Angeles, and Vice-Chairman, Dr. Frank H. Mayfield, Cincinnati, for the ensuing year; Secretary, Adolph L. Sahs, Iowa City, and representative to the Scientific Exhibit, Dr. Benjamin Boshes, Chicago, for the ensuing three years; delegate, Dr. Francis M. Forster, Washington, D. C., and alternate delegate, Dr. G. Wilse Robinson Jr., Kansas City, Mo., for two-year terms beginning Jan. 1, 1957; representative to the American Board of Psychiatry and Neurology, Dr. Lee M. Eaton, Rochester, Minn.

Dr. Forster reported concerning activities of the House of Delegates. The report on the American Board of Psychiatry and Neurology was read by the Secretary, Dr. Karl O. Von Hagen, Los Angeles, and was approved as read. The Secretary read the report of the representative to the American Board of Neurological Surgery, which was approved.

SECTION ON OBSTETRICS AND GYNECOLOGY

The meetings of the Section on Obstetrics and Gynecology were held in the Gold Coast Room of the Drake Hotel on Tuesday, Wednesday, and Thursday afternoon, June 12, 13, and 14, 1956. The Thursday afternoon session was a joint meeting with the Section on Urology. Dr. Frank R. Lock, Washington, D. C., Chairman of the Section on Obstetrics and Gynecology, presided over the three meetings.

The panel discussions and papers were presented as listed in the official program.

At the business meeting on Wednesday, June 13, it was reported that a Resolution on Straight Internships in Obstetrics and Gynecology which had been adopted by the Section and introduced in the House of Delegates by the delegate, Dr. Ralph E. Campbell, Madison, Wis., had not been approved by the House.

The following officers were elected: Chairman, Dr. D. Frank Kaltreider, Baltimore, Vice-Chairman, Dr. Woodard D. Beacham, New Orleans, and representative to the Scientific Exhibit, Dr. Frederick H. Falls, Oak Park, Ill., for the ensuing year; secretary, Dr. Keith P. Russell, Los Angeles, for the ensuing three years; delegate, Dr. Ralph E. Campbell, Madison, Wis., and alternate delegate, Dr. Roy J. Heffernan, Brookline, Mass., for two-year terms beginning Jan. 1, 1957. Drs. F. Bayard Carter, Durham, N. C., Robert A. Kimbrough, Philadelphia, and Robert L. Faulkner, Cleveland, were reelected to represent the Section on the American Board of Obstetrics and Gynecology.

SECTION ON OPHTHALMOLOGY

The Section of Ophthalmology held its meetings on Tuesday, Wednesday, and Thursday afternoon, June 12, 13, and 14, 1956, in Thorne Hall of Northwestern University. It also held a special business meeting on Tuesday evening, June 12.

With the exception of a portion of the Wednesday afternoon meeting, during which the Vice-Chairman, Dr. John B. Hitz, Milwaukee, was in the Chair, the Chairman, Dr. Albert B. Reudemann Sr., Detroit, presided. All of the papers were read and discussed as listed in the official program.

At the business meeting on Wednesday afternoon, the following officers were elected: Chairman, Dr. Algernon B. Reese, New York, Vice-Chairman, Dr. Hedwig S. Kuhn, Hammond, Ind., and representative to the Scientific Exhibit, Dr. Frank W. Newell, Chicago, for the ensuing year; Secretary, Dr. Harold G. Scheie, Philadelphia, for the ensuing three years; delegate, Dr. Ralph O. Rychener, Memphis, Tenn., and alternate delegate, Dr. Harvey E. Thorpe, Pittsburgh, for two-year terms beginning Jan. 1, 1957.

The following actions were taken by the executive committee of the Section at the special business meeting on Tuesday evening:

Reports of the following-named committees of the Section were accepted as given:

American Committee on Optics and Visual Physiology
Committee on the American Board of Ophthalmology
Registry of Ophthalmic Pathology
Scientific Exhibit of the Section on Ophthalmology
Committee on Museum of Ophthalmic History
Committee on Nomenclature of the Section on Ophthalmology
Committee on the American Orthoptic Council
Committee on Industrial Ophthalmology
Representative to the College of Surgeons, Board of Governors
Report of the Lucien Howe Fund
Report of the Delegate to the House of Delegates
Report of the Representative to the Pan American Congress
Committee on Eye Banks
Committee on Civil Defense
Committee on Ophthalmology in Government Services
Committee on Knapp Testimonial Fund
Committee on Research in Eye Diseases

Committee members and Section representatives were appointed or reappointed as follows: Dr. Arthur Linksz reappointed to American Committee on Optics and Visual Physiology for three years; Dr. Wilbur C. Rucker appointed to Committee on American Board of Ophthalmology for four years; Dr. Algernon B. Reese appointed to succeed Dr. Jonas Friedenwald on Committee on National Museum of Ophthalmic Pathology; Drs. Burton Chance, chairman, Hans Barkan, and Frederick C. Cordes reappointed to Committee on Museum of Ophthalmic History; Dr. Conrad Berens reappointed on Committee to National Conference on Medical Nomenclature; Dr. Robert E. Laughlin appointed to Committee on American Orthoptic Council for three years; Dr. Parker Heath reappointed as delegate and Dr. W. Guernsey Frey as alternate to International Congress of Ophthalmology; Dr. James H. Allen reappointed as delegate to Pan American Congress; Drs. A. D. Ruedemann Sr., and Michael J. Hogan appointed as delegates to National Committee for Research in Eye Diseases; Drs. Ralph O. Rychener, chairman, Charles E. Jackle, J. Spencer Dryden, Edwin F. Tait, Everett L. Goar, Barnet R. Sakler, A. D. Ruedemann, and Alson E. Braley reappointed to Committee on Public Relations; Drs. William A. Mann, chairman, P. Robb McDonald, and Warren Wilson appointed to Committee on Civil Defense; Drs. Brittain F. Payne, chairman, J. H. King Jr., W. Maxwell Thomas, James H. Allen, and George L. Tabor Jr., reappointed to the Committee on Ophthalmology in Government Services.

The Section decided to discontinue its participation in the present Joint Committee on Industrial Ophthalmology and to submit to the Council on Industrial Health of the A.M.A. the names of six ophthalmologists for the selection of two as members of a new joint committee to be composed of representatives of the Section, the American Academy of Ophthalmology and Otolaryngology, and the American Ophthalmological Society.

The Section nominated three members, Drs. James N.
C [illegible] ohn Matthews, and John Long for the selection of
[illegible] Board of Governors of the American College of
[illegible] s to be elected as the Section representative on that

The Section accepted the recommendation of its Committee on Eye Banks to form a Joint Committee on Eye Banks, with the following organizations participating: Section on Ophthalmology, American Ophthalmological Society, Academy of Ophthalmology and Otolaryngology, and Association for Research in Ophthalmology. The present committee of the Section will be continued until the joint committee is organized.

The Knapp Medal was not awarded for 1954.

It was decided to discontinue publication of the Section Transactions, and it was announced that the A. M. A. *Archives of Ophthalmology* would publish the Transactions in a special issue containing a report of the business session, committee reports, and the scientific papers and discussions.

The Prize in Ophthalmology, a gold medal, was awarded to Dr. Derrick Vail by Dr. Trygve Gundersen.

The $250 prize for the best exhibit was awarded to Dr. Bertha A. Klien for her exhibit on "Survey of the Pathogenesis of Retinal Vein Occlusions."

Dr. T. E. Sanders was awarded the $250 prize for his paper entitled, "Fungus Keratitis," judged on the basis of presentation and originality.

Members of the Committee on Award of the Knapp Medal were elected unanimously as follows: Drs. Charles K. W. Ascher, chairman, Derrick Vail, and Francis H. Adler.

The report of the Committee on Public Relations was read and approved, and two new members of this committee, Drs. Barnet Sakler and Alson E. Braley, were appointed.

Two resolutions were adopted and referred to the Section delegate, Dr. William L. Benedict, for introduction in the House of Delegates.

NOTE: These resolutions, No. 51 and No. 52, will be found in the abstract of the Proceedings of the House in the Oct. 6 issue of THE JOURNAL.

Dr. Ralph H. Pino contributed a statement on "Distribution Responsibilities of the Specialties Represented in the Scientific Assembly."

SECTION ON ORTHOPEDIC SURGERY

The meetings of the Section on Orthopedic Surgery were held on Tuesday, Wednesday, and Thursday afternoon, June 12, 13, and 14, 1956, in the ballroom of the Lake Shore Club. The Thursday afternoon session was a joint meeting with the Section on Physical Medicine.

At the business meeting on June 13, the following officers were elected: Chairman, Dr. Edward L. Compere, Chicago, Vice-Chairman, Dr. Frederick R. Thompson, New York; Secretary, Dr. H. Herman Young, Rochester, Minn.; delegate, Dr. H. Relton McCarroll, St. Louis; alternate delegate, Dr. Robert J. Joplin, Brookline, Mass.; representative to the Scientific Exhibit, Dr. James I. Kendrick, Cleveland, Drs. J. Vernon Luck, Los Angeles, Edward R. Schottstaedt, San Francisco, and George O. Eaton, Baltimore, were elected to represent the Section on the American Board of Orthopaedic Surgery.

SECTION ON PATHOLOGY AND PHYSIOLOGY

The Section on Pathology and Physiology met on Tuesday and Wednesday afternoon, June 12 and 13, 1956, in the Walton Room of the Drake Hotel, and on Thursday afternoon, June 14, in a joint meeting with the Section on Gastroenterology and Proctology in the University of Illinois Gymnasium on Navy Pier.

Dr. Roger D. Baker, Chairman, Durham, N. C., presided over the meetings, and all papers were read and a panel discussion conducted as listed in the official program.

The following officers were elected at the business meeting on Wednesday, June 13: Chairman, Dr. H. Russell Fisher, Pasadena, Calif., Vice-Chairman, Dr. Edwin F. Hirsch, Chicago, and representative to the Scientific Exhibit, Dr. Samuel A. Levinson, Chicago, for the ensuing year; Secretary, Dr. Hugh A. Edmonson, Los Angeles, for the ensuing three years. The delegate and alternate delegate, Drs. Lall G. Montgomery, Muncie, Ind., and Harry J. Corper, Denver, were elected in 1955 for two-year terms ending Dec. 31, 1957.

SECTION ON PEDIATRICS

The meetings of the Section on Pediatrics were held in the Tally Ho Room of the Sheraton Hotel on Tuesday, Wednesday, and Thursday morning, June 12, 13, and 14, 1956, the Tuesday morning session being a joint meeting with the Section on Preventive and Industrial Medicine and Public Health.

Both Dr. F. Thomas Mitchell, Chairman, Memphis, Tenn., and Dr. Edward P. Luongo, Los Angeles, Chairman of the Section on Preventive and Industrial Medicine and Public Health, presided over the joint meeting on Tuesday, and Dr. Mitchell occupied the Chair at the Wednesday and Thursday meetings. All papers were read as listed in the official program, and some were discussed from the floor.

The business meeting was held on June 13. Dr. Hugh Dwyer presented the report of the Abraham Jacobi Fund, stating there is a balance of $5,473 in the account. A resolution was adopted which instructed the secretary to request from the American Board of Pediatrics a copy of its constitution and bylaws; a financial statement which shall include salaries paid; and information as to whether appointments to the Board by the Section are mandatory or may be rejected. The resolution also provided that the American Academy of Pediatrics be urged to make the same request. Dr. Woodruff L. Crawford, Rockford, Ill., made a brief report of his work as a member of the House of Delegates representing the Section.

The following officers were elected: Chairman, Dr. M. G. Peterman, Milwaukee, Vice-Chairman, Dr. Alfred E. Fischer, New York, and representative to the Scientific Exhibit, Dr. F. Thomas Mitchell, Memphis, Tenn., for the ensuing year; delegate, Dr. Woodruff L. Crawford, Rockford, Ill., and alternate delegate, Dr. Walter B. Stewart, Atlantic City, N. J., for two-year terms beginning Jan. 1, 1957. The Secretary was elected in 1955 for the ensuing three years.

SECTION ON PHYSICAL MEDICINE

Meetings of the Section on Physical Medicine were held on Tuesday and Wednesda afternoon, June 12 and 13, 1956, in the Oceanic Room of the Knickerbocker Hotel, and on Thursday, June 14, a joint meeting was held with the Section on Orthopedic Surgery in the ballroom of the Lake Shore Club.

All of the papers and a panel discussion were presented as listed on the program.

At the business meeting on Wednesday, June 13, the following officers were elected: Chairman, Dr. Louis B. Newman, Chicago, Vice-Chairman, Dr. Miland E. Knapp, Minneapolis, and representative to the Scientific Exhibit, Dr. Donald A. Covalt, New York, for the ensuing year; Secretary, Dr. Walter J. Zeiter, Cleveland, for the ensuing three years; delegate, Dr. Frank H. Krusen, Rochester, Minn., for a two-year term beginning Jan. 1, 1957. The alternate delegate, Dr. Arthur L. Watkins, Boston, was elected in 1955 for a two-year term ending Dec. 31, 1957.

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

A joint meeting with the Section on Pediatrics was held on Tuesday morning, June 12, 1956, in the Tally Ho Room of the Sheraton Hotel. Dr. Edward P. Luongo, Chairman, Los Angeles, and Dr. F. Thomas Mitchell, Memphis, Tenn., Chairman of the Section on Pediatrics, presided over the joint session. The other meetings of the Section on Preventive and Industrial Medicine and Public Health were held on Wednesday and Thursday morning, June 13 and 14, in the Cinema Theater, the Thursday session being a joint meeting with the American Association of Public Health Physicians.

Dr. Luongo presided over the Wednesday morning meeting and Dr. Bruce Underwood, Washington, D. C., over the Thursday session. Papers were presented and discussed as listed in the official program.

The following officers were elected at the business meeting on June 13: Chairman, Dr. Edward J. Tracy, Dayton, Ohio, Vice-Chairman, Dr. Bruce Underwood, Washington, D. C., and representative to the Scientific Exhibit, Dr. Paul A. Davis, Akron, Ohio, for the ensuing year; delegate, Dr. Rutherford T. Johnstone, Los Angeles, and alternate delegate, Dr. Oscar A. Sander, Milwaukee, for two-year terms beginning Jan. 1, 1957. The secretary, Dr. Frank Princi, Cincinnati, was elected at a previous annual meeting to serve until 1960.

The Section adopted a resolution on periodic physical examinations, which was referred to the Section delegate for presentation in the House of Delegates.

NOTE: The resolution, No. 54, will be found in the abstract of the Proceedings of the House in the Oct. 6 issue of The Journal.

SECTION ON RADIOLOGY

The Section on Radiology held meetings on Tuesday and Wednesday morning, June 12 and 13, 1956, in the ballroom of the Lake Shore Club, and a joint meeting with the Section on Diseases of the Chest on Thursday morning, June 14, in the ballroom of the Knickerbocker Hotel. Dr. Leo P. Rigler, Duarte, Calif., Chairman of the Section on Radiology, presided at all three meetings.

All papers and discussions were presented as listed in the official program.

At the business meeting on Wednesday, June 13, officers were elected as follows: Chairman, Dr. Donald S. Childs, Syracuse, N. Y., Vice-Chairman, Dr. Wendell G. Scott, St. Louis, and representative to the Scientific Exhibit, Dr. Richard H. Chamberlain, Philadelphia, for the ensuing year; delegate, Dr. Byrl R. Kirklin, Rochester, Minn., and alternate delegate, Dr. Eugene P. Pendergrass, Philadelphia, for two-year terms beginning Jan. 1, 1957; representative to the American Board of Radiology, Dr. Ernest Harvey Wood, Chapel Hill, N. C., for a term of six years. The term of the Secretary, Dr. Traian Leucutia, Detroit, does not expire until the annual meeting in 1957.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

The meetings of the Section on Surgery, General and Abdominal, were held on Tuesday, Wednesday, and Thursday morning, June 12, 13, and 14, 1956, in the University of Illinois Gymnasium on Navy Pier. The first meeting was presided over by the Chairman, Dr. Waltman Walters, Rochester, Minn., and Dr. Walters shared the Chair during the other two meetings with the Vice-Chairman, Dr. Robert E. Gross, Boston.

The papers and discussions were delivered as indicated in the official program.

The time of the business meeting of the Section on Wednesday, June 13, was changed to the end of the session rather than at the beginning as scheduled, on motion of Dr. Henry Ransom, Ann Arbor, Mich., seconded by Dr. Claude Hunt, Kansas City, Mo., and unanimously carried.

Dr. René Fontaine, Professor and Dean of the Faculty of Medicine, Strasbourg, France, was presented to the members and guests in attendance. Dr. Fontaine spoke glowingly of the contribution made by American surgeons in the field of cardiovascular surgery.

A report was given by Dr. Grover C. Penberthy, Detroit, Section delegate, regarding the work of the House of Delegates.

A report on the American Board of Surgery was given by the Section representative to the Board, Dr. John M. Waugh, Rochester, Minn.

The following officers were elected: Chairman, Dr. Walter G. Maddock, Chicago, Vice-Chairman, Dr. Henry K. Ransom, Ann Arbor, Mich., and representative to the Scientific Exhibit, Dr. John H. Mulholland, New York, for the ensuing year; Secretary, Dr. Gustaf E. Lindskog, New Haven, Conn., for the ensuing three years; delegate, Dr. Grover C. Penberthy, Detroit, for a term of one year beginning Jan. 1, 1957.

SECTION ON UROLOGY

The Section on Urology met on Tuesday and Wednesday afternoon, June 12 and 13, 1956, in the ballroom of the Drake Hotel, and on Thursday afternoon, June 14, in a joint meeting with the Section on Obstetrics and Gynecology in the Gold Coast Room of the Drake Hotel. The Chairman, Dr. Rubin H. Flocks, Iowa City, presided at the meetings on June 12 and 13, and the Chairman of the Section on Obstetrics and Gynecology, Dr. Frank R. Lock, Winston-Salem, N. C., at the June 14 joint session.

All papers and discussions were delivered as listed in the official program.

John A. Morrissey awards were presented to Drs. Donald E. Burke and Chester Winter, Los Angeles, and to Drs. Eugene F. Poutasse, William J. Engel, and Harriet Dustan, Cleveland, for excellent scientific exhibits demonstrated at this session.

At the business meeting on Wednesday, June 13, the following officers were elected: Chairman, Dr. Stanford W. Mulholland, Philadelphia, and Vice-Chairman, Dr. Roger W. Barnes, Los Angeles, for the ensuing year; Secretary, Dr. Thomas A. Morrissey, New York, and representative to the Scientific Exhibit, Dr. Milton M. Coplan, Miami, Fla., for the ensuing three years; delegate, Dr. Jay J. Crane, Los Angeles, and alternate delegate, Dr. Earl E. Ewert, Boston, for two-year terms beginning Jan. 1, 1957.

MEDICAL NEWS

CALIFORNIA

Memorial Course in Surgery.—The San Francisco Academy of General Practice will dedicate a new surgical refresher course, to be given at the Fort Miley Veterans Administration Hospital, San Francisco, to the memory of the late Dr. Francis T. Hodges, president of the California Academy of General Practice, who died Aug. 15 in Santa Barbara. The tentative program is as follows: Oct. 23, thoracic surgery clinic; Oct. 30, surgical technique clinic, Nov. 6, traumatic surgery clinic; Nov. 13, preoperative and postoperative care clinic; Nov. 20, practical office procedure clinic, Nov. 27, breast clinic. Those desiring information should contact Dr. Lawrence M. Trauner, 450 Sutter St., San Francisco.

Seminar on Neuromuscular Disabilities.—A seminar, "Comprehensive Patient Care and Rehabilitation of Selected Neuromuscular Disabilities," will be presented jointly by the Orthopaedic Hospital and the Rancho Los Amigos Hospital, Los Angeles, Oct. 22-26. This seminar, aided by a grant from the National Foundation for Infantile Paralysis, is open to physicians, who may apply to their local chapters of the foundation for financial assistance. Guest speakers will include Drs. Jessie Wright, Leetsdale, Pa., Edwin R. Schottstaedt, San Francisco; Elizabeth S. Austin, Los Angeles, and Cyril B. Courville, Los Angeles. The fee is $15; lunch for the five days (available at both hospitals) is $4. Those enrolled are invited to be guests of the two hospitals for a buffet supper preceding the Wednesday evening program.

DISTRICT OF COLUMBIA

Lecture by Dr. Pack.—Dr. George T. Pack, New York, will lecture on "The Philosophy of Cancer Therapy," Oct. 22 in Washington, D. C., at the first meeting of a new lecture series and Interschool Student Cancer Society (under the sponsorship of the local hospitals, medical schools, and American Cancer Society).

ILLINOIS

Chicago

Medical History Meeting.—The Society of Medical History of Chicago will hold an open meeting at the Institute of Medicine (fourth floor, 86 E. Randolph St.), Oct. 17, 8 p. m. Dr. Francis J. Gerty, head, department of psychiatry, University of Illinois College of Medicine, will speak on "The Story of Three Women," and Dr. Joseph H. Kiefer, associate professor, department of urology, University of Illinois College of Medicine, on "The History of Lithotomy." All are welcome.

Society News.—The Jackson Park branch of the Chicago Medical Society, in cooperation with the Chicago Heart Association, will meet at the University of Chicago, Pathology 117 (Amphitheater), 950 E. 59th St., Oct. 18. A fellowship hour at 6 p m. will precede dinner and the scientific meeting at 8 p. m. Dr. Ormand C. Julian, associate professor in surgery, University of Illinois College of Medicine, will discuss "Cardiovascular Conditions Amenable to Surgery." Physicians are welcome. Reservations for the dinner should be made by noon Oct. 18 through Dr. William J. Hand (SAginaw 1-2480).

Cancer Lecture Series.—Northwestern University Medical School announces its annual series of cancer lectures to be presented in the auditorium of the Veterans Administration Research Hospital, 333 E. Huron St., 5-6 p. m. on Wednesday evenings. The program, under the direction of Dr. William B. Wartman, chairman, department of pathology at the medical school, began Oct. 3, when Dr. Shields Warren, Cancer Research Institute, New England Deaconess Hospital, Boston, lectured on "The Effect of Radiation on Populations." "Neoplasia and Endocrine Imbalance in the Parakeet" was discussed on Oct. 10 by Dr Hans G. Schlumberger, Ohio State University College of Medicine, Columbus. Remaining lectures include

Oct 17, Debatable Tumors, Danely P. Slaughter, University of Illinois College of Medicine.

Oct 24, Effects of Multimillion Volt Irradiation on Treatment of Cancer, Roger A. Harvey, University of Illinois College of Medicine

Oct 31, Tumors of the Soft Tissues, Arthur P Stout, Columbia University College of Physicians and Surgeons, New York.

Nov 7, Surgery of Hepatic Neoplasms, Alexander Brunschwig, Cornell University Medical College, New York

Nov 14, Diagnosis and Treatment of Neoplasms of the Lung, Rollin A Daniel Jr, Vanderbilt University School of Medicine, Nashville, Tenn

Nov 21, Management and Care of the Patient with Inoperable and Terminal Cancer, John S LaDue, Cornell University Medical College, New York

IOWA

Coxsackie Disease in Iowa.—In its communicable disease summary for the week ended Sept. 15, the U. S. Public Health Service reports that Dr. Ralph H. Heeren, Iowa State Department of Health, has received a report of the isolation of Coxsackie B-5 virus from 21 patients living in three different counties in the state. In July a small outbreak of illness occurred in Polk County. The cases, originally diagnosed as nonparalytic poliomyelitis, were characterized by severe headache, stiffness of the neck and back, joint and muscle aches and pains, pleurodynia, nausea, and vomiting. The period of acute illness varied from five to seven days. Recovery was complete within 10 to 14 days The Coxsackie B-5 virus was isolated from the stools of six of the patients. Later in July, with the aid of several staff members from the Public Health Service Kansas City field station, a detailed study was made in Cerro Gordo County. Medical histories and laboratory specimens were obtained from about 200 persons with an illness similar to that reported in Polk County. To date, Coxsackie B-5 virus has been isolated from the stools of 13 persons. The same virus has been isolated from persons in Dubuque County.

KANSAS

School Health Conference.—A school health conference is scheduled at the University of Kansas Medical Center Oct. 22-23, for discussion of heart disease and pulmonary disease. Information is available from the Department of Postgraduate Medicine, University of Kansas School of Medicine, Kansas City 12

KENTUCKY

Fellowship Openings.—Applications for fellowship stipends in child psychiatry (two first-year fellowships, $3,400) are being considered from Oct. 1 to Dec. 1 at the Louisville Child Guidance Clinic, a fully accredited training center. Details may be obtained from Dr. S. Spafford Ackerly, University Medical Center, 206 E. Chestnut St., Louisville 2

MISSISSIPPI

Academic Dedication.—The University of Mississippi School of Medicine, Jackson, will hold an academic dedication Oct. 23-24 (approved for credit, 10 hours category 1, American Academy of General Practice). Papers to be presented include the following:

The Problems of Intersexuality, F. Bayard Carter, Durham, N C

Psychiatry and Undergraduate Medical Education, George N. Raines, Washington, D. C.

Certain Unsolved Problems in Amoebiasis, Henry E. Meleney, New Orleans

Nutrition and Atherosclerosis, Fredrick J. Stare, Boston

The Place of Pathology in Medicine of the Future, Douglas H Sprunt, Memphis, Tenn

Pediatric Diagnostic Problems, Amos Christie, Nashville, Tenn

X-Ray Screen Intensification and Its Import in Clinical and Experimental Medicine, Russell H. Morgan, Baltimore

Contribution of Pyramidal and Extrapyramidal System to the Use of Skeletal Muscle in the Primate, Marion Hines, Ph D, Emory University, Ga

---

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education, and public health. Programs should be received at least three weeks before the date of meeting.

Topic to be announced, Isidor S. Ravdin, Philadelphia.

Basic Physiology as a Clinical Science, Carl J. Wiggers, Cleveland.

Experimental Study of Combined Viral and Bacterial Infections, G. John Buddingh, New Orleans.

The Challenge of Mood-Altering Drugs, Chauncey D. Leake, Ph.D., Columbus, Ohio.

A tour of the University Medical Center will be conducted at 12 noon on Tuesday and Wednesday. Alton C. Bryant, provost of the University of Mississippi, will preside over a dinner, Tuesday, 7 p. m., at the Heidelberg Hotel, when Joseph C. Hinsey, Ph.D., director of the New York Hospital–Cornell Medical Center, will speak.

NEW YORK

Cardiac Teaching Day.—A cardiac teaching day will be held Oct. 18, beginning at 2:30 p. m. in the Educational Building, Charles S. Wilson Memorial Hospital, Johnson City. Dr. Howard A. Eder, New York, will speak on the relation between diet and atherosclerosis, which will be followed by "Special Problems in the Treatment of Congestive Heart Failure" by Dr. Arthur C. DeGraff, New York, and "Office Fluoroscopy and Recent Advances in Roentgen Diagnosis of Heart Disease" by Dr. Israel Steinberg, New York. The reception at the hospital, 5:30 p. m., will be followed by dinner (6:45 p. m., courtesy of the Endicott-Johnson medical department) at the Endicott-Johnson Recreation Center in Johnson City. At 8 p.m. Dr. Irving S. Wright, professor of clinical medicine, Cornell University Medical College, New York, will deliver a paper on "Cerebral Vascular Diseases." Expenses are underwritten jointly by the Broome County Medical Society, the Heart Committee of the Health Association of Broome County, the New York State Department of Health, and the Medical Society of the State of New York. Postgraduate credit will be given to members of the American Academy of General Practice.

Conference on Meprobamate.—The New York Academy of Sciences will present a conference on meprobamate and other agents used in mental disturbances Oct. 18-19 at the Barbizon-Plaza Hotel (101 W. 58th St. at 6th Avenue). Co-chairmen are Dr. James G. Miller, Mental Health Research Institute, University of Michigan, Ann Arbor, Mich., and Dr. Frank M. Berger, medical director, Wallace Laboratories, New Brunswick, N. J. The opening session Thursday 9 a. m., under the chairmanship of Dr. Harry Beckman, Marquette University School of Medicine, Milwaukee, will be concerned with "Chemistry, Pharmacology and Mode of Action of Meprobamate." "The Treatment of Psychoneurotic Conditions" will be the subject of the afternoon session, under the chairmanship of Dr. Edwin F. Gildea, Washington University School of Medicine, St. Louis. At 5:30 p. m. a cocktail hour will be held at the academy building. Main themes Friday will include "The Treatment of Psychiatric and Other Conditions with Meprobamate" (session chairman, Dr. Harry C. Solomon, Harvard Medical School, Boston) and "Use of Meprobamate in Muscle Spasm" (session chairman, Dr. H. Houston Merritt, Columbia University College of Physicians and Surgeons, New York). A summary of the conference will be presented by Dr. Ralph W. Gerard, University of Michigan, Ann Arbor.

OHIO

Northwestern Ohio Meeting.—The Northwestern Ohio Medical Association will hold its 112th scientific assembly in the Administration Building, Bowling Green State University, Bowling Green, Oct. 17 (six hours credit, category 1, American Academy of General Practice). At 9:50 a. m. a welcome address will be delivered by Dr. John V. Pilliod, Grand Rapids, president, Wood County Medical Society. The program will include the following presentations:

Infectious Diseases and Their Present Day Treatment, Paul A. Bunn, State University of New York College of Medicine, Syracuse, N. Y.

What Cardiovascular Surgery Offers the Practicing Physician, Robert P. Glover, Presbyterian Hospital, Philadelphia.

Role of the Community Hospital in Diseaster Planning, Mr. Anthony W. Eckert, Perth Amboy (N. J.) General Hospital. Moderators: Charles S. Wohl and Orrin C. Keller, Toledo.

Abdominal Emergencies in Infancy, H. William Clatworthy, Ohio State University College of Medicine, Columbus.

Clinical Applications of Available Laboratory Blood Tests, Robert L. Wall, Ohio State University College of Medicine, Columbus.

The meeting will adjourn at 3:45 p. m. when coffee and refreshments will be served at the new Wood County Hospital. Miss Anna Belle Kinney, R.N., administrator, will speak on "How Does This Hospital Plan for Mass Casualties?"

OKLAHOMA

Annual Clinical Conference.—The 26th annual clinical conference of the Oklahoma City Clinical Society will be held at the Biltmore Hotel, Oklahoma City, Oct. 22-25. Round-table discussions (free to registered associate members) will be held at noon each day. On Monday, Tuesday, and Wednesday, separate luncheons will be held for the medical and surgical groups; on Thursday, one large combined luncheon will be conducted. Tuesday evening the Oklahoma City Chamber of Commerce will honor the clinical society and its visiting members with a dinner in the Persian Room of the Skirvin Tower Hotel (wives and guests invited). Specialty lectures will be delivered by the following guests of honor: Drs. Albert Behrend, Philadelphia; William H. Beierwaltes, Ann Arbor, Mich.; Willis E. Brown, Little Rock, Ark.; Vincent P. Collins, Houston, Texas; Patrick J. Fitzgerald, Brooklyn, N. Y.; Gordon P. McNeer, New York; Rufus C. Goodwin, San Francisco; Kendall B. Corbin, Rochester, Minn.; Harold W. Elley, Ph.D., Wilmington, Del.; John F. Crigler and Ethan A. Brown, Boston; Gordon Meiklejohn, Denver; Donald J. Birmingham, Cincinnati; A. Keller Doss, Fort Worth, Texas; Joseph H. Ogura, St. Louis; Edward T. Evans, Minneapolis; and Henry B. Turner, Memphis, Tenn. The annual banquet in honor of the associate members will be held Monday, 7 p. m. Dr. Elley, chairman of the Research Study Committee of the National Association of Mental Health, will be the principal speaker. Advance registration fee ($20) may be sent to the Executive Office of the Oklahoma City Clinical Society, 503 Medical Arts Bldg., Oklahoma City.

OREGON

Sommer Memorial Lectures.—In conjunction with the 82nd annual session of the Oregon State Medical Society, the 24th Sommer Memorial Lectures will be presented Oct. 17-19 at the Masonic Temple, Portland. The lecturers will be Dr. Paul A. Owren, professor of medicine, University of Oslo, Norway, whose topics will be "The Coagulation of Blood," "Disordered Blood Coagulation," and "Permanent Anticoagulant Therapy in Cardiovascular Disease;" Dr. Alfred Blalock, professor of surgery, Johns Hopkins University School of Medicine, Baltimore, who will present "A Consideration of Certain Aspects of Cardiovascular Surgery," "Some of the Important Recent Advances in Surgery," and "Remarks on the Nature of Discoveries in Medicine"; and Dr. Leo H. Bartemeier, Baltimore, medical director, Seton Psychiatric Institute, and clinical professor of psychiatry, Georgetown University School of Medicine, Washington, D. C., who will have as his subjects "The Influence of Patients on Their Physicians," "The Practical Value of the Concept of Multiple Causality in Diagnosis and Treatment," and "On Referring Patients to Other Physicians."

PENNSYLVANIA

Institute on Cerebral Palsy.—An institute on cerebral palsy will be held Oct. 20 in the Berkshire Hotel, Reading, 3-5 p. m. and 7-9 p. m. Dr. Temple S. Fay, Philadelphia, will conduct the institute and will discuss the classification and early recognition of cerebral palsy, his neurophysiological concept, and reflex and neuromuscular therapy. Cases from the local Cerebral Palsy Treatment Center will be presented, and Dr. Fay's film on the evolutionary development of primitive patterns will be shown. The institute is sponsored by the Reading chapter of the American Business Club's Cerebral Palsy Treatment Center, the Berks County Medical Society, the Pennsylvania Academy of Physical Medicine and Rehabilitation, the Pennsylvania chapter of the American Physical Therapy Association, the Pennsylvania Society for Crippled Children and Adults, and the Pennsylvania chapter of United Cerebral Palsy. Physicians and therapists are invited to register in advance by communicating with Dr. Herman L. Rudolph, 400 N. Fifth St., Reading. There will be no registration fee.

GOVERNMENT SERVICES

AIR FORCE

Personal.—Brig. Gen. M. S. White, M. C., U. S. Air Force, has been named director of medical staffing and education for the Air Force Medical Service and has assumed his duties in the Office of the Surgeon General. General White is a diplomate of the American Board of Internal Medicine and Board of Preventive Medicine.

NAVY

Personal.—Capt. David W. Lyon Jr., M. C., U. S. Navy, was placed on the retired list of officers on Sept. 1, after having completed more than 31 years' active service.

In addition to the Bronze Star, he wears the World War I Victory medal with three combat clasps, American Defense Service medal with Sea Duty Star, American Area, Asiatic-Pacific Area medal with two engagement stars, and the World War II Victory and the China Occupation medal. Captain and Mrs. Lyon plan to settle in California in the San Francisco Bay area in the near future.

New Technical Director at Research Institute.—The Naval Medical Research Institute, Bethesda, Md., has as its new technical director Dr. Ralph S. Muckenfuss, who came from the Navy Biological Laboratory of the University of California. In 1925 he joined the Rockefeller Institute in New York, as assistant in bacteriology. He was assistant professor of medicine in Washington University School of Medicine, St. Louis, from 1929 to 1935. He retired in 1953 from the Department of Public Health of New York City. During the war Dr. Muckenfuss was a colonel in the U. S. Army Medical Corps. He served as commanding officer of the first medical general laboratory in the European theater. He also holds the Legion of Merit.

VETERANS ADMINISTRATION

Annual Paraplegic Conference.—The fifth Annual Paraplegic Conference of the Veterans Administration will convene at the Veterans Administration Hospital, Hines, Ill., on Oct. 16, 17, and 18. The opening session will begin at 1:00 p. m. on Oct. 16, and the meeting will close at noon on Oct. 18. Participants will include doctors from all the Veterans Administration paraplegia centers in the United States. All physicians are cordially invited to attend.

PUBLIC HEALTH SERVICE

Regular Corps Examinations for Medical Officers.—A competitive examination for appointment of medical officers to the regular corps of the U. S. Public Health Service will be held in various places throughout the country on Nov. 27-30. The examinations will include an interview, physical examination, and comprehensive objective examinations in the professional fields. Appointments provide opportunities for careers in clinical medicine, research, and public health. They will be made in the ranks of assistant and senior assistant, equivalent to Navy ranks of lieutenant (j. g.) and lieutenant. Entrance pay for both grades for persons with dependents is $7,498 per year. Qualified officers are promoted at regular intervals. Benefits other than promotions include periodic pay increases, 30 days' annual leave, sick leave, medical care, disability retirement pay, and regular retirement pay, which is three-fourths of annual basic pay at time of retirement.

Requirements are U. S. citizenship, age of at least 21 years, and graduation from a recognized school of medicine. For the rank of assistant surgeon, at least seven years of collegiate and professional training and appropriate experience are needed. For senior assistant surgeon, an additional three years, for a total of at least 10 years of collegiate and professional training and appropriate experience, are required. Application forms may be obtained from the Chief, Division of Personnel, U. S. Public Health Service, Washington 25, D. C. Completed application forms must be received in the division of personnel no later than Oct. 13.

Special Citation for Union Pacific.—The U. S. Public Health Service has awarded a special citation to the Union Pacific Railroad, Surgeon General Leroy E. Burney announced Sept. 7. This is the second award to a railroad since the special citation was established in 1952. The citation is awarded when all of a railroad's operating dining cars have achieved a rating of 95 or better on an official PHS inspection during a single year. The presentation was made Sept. 10 in Omaha, where the main offices of the Union Pacific Railroad are located. Officials of the Department of Health, Education, and Welfare, Public Health Service, and Union Pacific Railroad took part in the ceremonies. The Erie Railroad was awarded the special citation in 1953.

Training in National Emergencies.—Sixty-six reserve officers of the U. S. Public Health Service from 58 cities attended a two-week training course in Washington, D. C., Sept. 17-28, to study public health activities in national emergencies. The course included lectures, panel discussions, committee work, field exercises, demonstrations, and problems.

Some of the major subjects studied were as follows: Conserving the Nation's Human Resources; National Aspects Affecting Defense; Health Emergency Planning; Chemical Agents—Hazard, Vulnerability, and Defense; Nuclear Weapons; Radioactivity and Interaction of Radiation with Matter; Radiation Detection Instruments; Implications of Biological Warfare; Feasibility of Biological Warfare Agents Against Water Supplies; Detection and Identification of Biological Agents; Epidemic Aid and Epidemic Intelligence; the Management of Injuries; First Aid, Sorting, and Medical Evacuation; Psychological Reactions to Disaster; Natural Disaster Aid to States, and Public Health Service Responsibilities in Natural Disaster; the Health Organization of Civil Defense; the Emergency Hospital, and the Medical Supply Program.

Advisory Council on Health Research Facilities.—Congress recently enacted legislation authorizing 90 million dollars over three years to assist institutions in building facilities for research in medicine, osteopathy, dentistry, public health, and related sciences. Federal grants must be matched by the institutions. The secretary of Health, Education, and Welfare on Sept. 10 appointed a 12-member advisory council to assist the Public Health Service in administering this new program. The advisory council established in the law will be known as the National Advisory Council on Health Research Facilities. The grants program will be administered by the National Institutes of Health.

The council held its first meeting at the Institutes in Bethesda, Md., on Sept. 24-25 to review initial applications for aid from medical schools, research hospitals, and other research institutions. Dr. Leroy E. Burney, surgeon general of the Public Health Service, presided. The surgeon general and an official of the National Science Foundation are ex officio members, with the former serving as chairman. Other members of the new council are:

George N. Aagaard, M.D., dean, School of Medicine, University of Washington, Seattle.
Eugene N. Beesley, LL.B., president, Eli Lilly and Company, Indianapolis.
Thomas H. Hunter, M.D., dean, School of Medicine, University of Virginia, Charlottesville, Va.
Carlyle Jacobsen, Ph.D., executive dean, Medical Education, State University of New York, Delmar, N. Y.
Paul C. Kitchin, professor of dental histology and embryology, School of Dentistry, Ohio State University, Columbus, Ohio.
Oliver H. Lowry, M.D., dean, School of Medicine, Washington University, St. Louis.
Robert A. Moore, M.Sc., vice chancellor, University of Pittsburgh, Pittsburgh.
F. C. Sowell, vice president and general manager, Radio Station WLAC, Nashville, Tenn.
John E. W. Sterling, Ph.D., president, Stanford University, Stanford, Calif.
Thomas B. Turner, M.D., professor of microbiology, School of Hygiene and Public Health, Johns Hopkins University, Baltimore.
James W. Wilson, Ph.D., chairman, department of biology, Brown University, Providence, R. I.

The 12th member will be James B. Mintener, Washington, D. C., who plans to resign soon as assistant secretary of the Department of Health, Education, and Welfare.

DEATHS

Katz, Elihu ⚕ New York City; born in New York City in 1889; Columbia University College of Physicians and Surgeons, New York City, 1914; professor of gastroenterology at the New York Polyclinic Medical School and Hospital; specialist certified by the American Board of Internal Medicine; life fellow of the American College of Gastroenterology; fellow of the New York Academy of Medicine; formerly vice-president of the Society for the Advancement of Gastro-Enterology; served as treasurer of the National Gastroenterological Association; chief gastroenterologist at the Sea View Hospital in Staten Island; consultant in gastroenterology at the Richmond Memorial Hospital in Staten Island and the Bound Brook (N. J.) Hospital; died July 20, aged 67, of heart disease.

Thornton, Michael Joseph, New York City; born Feb. 22, 1876; Albany (N. Y.) Medical College, 1901; an associate member of the American Medical Association; at one time professor of neurology at the New York University Post-Graduate Medical School; veteran of World War I; served on the staffs of the Craig Colony in Sonyea and the Central Islip (N. Y.) State Hospital; formerly assistant and later chief physician and psychiatrist of the psychiatric service at Bellevue Hospital; resigned in 1934 as general medical superintendent of the Department of Bellevue and Allied Hospitals; retired in 1954 as resident psychiatrist at the Four Winds in Katonah; died in St. Luke's Hospital July 23, aged 80, of a cerebral vascular accident.

Goodridge, Malcolm, New York City; Columbia University College of Physicians and Surgeons, New York City, 1898; emeritus professor of clinical medicine at Cornell University Medical College; an associate member of the American Medical Association; past-president of the New York Academy of Medicine, which on Jan. 5, 1956, presented him with its plaque for distinguished service; active on the staffs of numerous hospitals and at his death was consulting physician to Mercy Hospital in Hempstead, New York Hospital, where he was an honorary member of the board of governors, Bellevue Hospital, and the Neurological Institute; died July 16, aged 83, of myocardial infarction.

de Rivas, Damaso, Tallahassee, Fla.; Medico-Chirurgical College of Philadelphia, 1898; University of Pennsylvania School of Medicine, Philadelphia, 1910; specialist certified by the American Board of Pathology; an associate member of the American Medical Association; member of the Medical Society of the State of Pennsylvania; formerly on the faculty of the University of Pennsylvania School of Medicine in Philadelphia, University of Pennsylvania Graduate School of Medicine in Philadelphia, and the Hahnemann Medical College and Hospital of Philadelphia; died May 28, aged 81.

Kalder, Ned Black ⚕ Detroit; University of Michigan Medical School, Ann Arbor, 1942; interned at the Henry Ford Hospital; served a residency at the University Hospital in Ann Arbor; at one time senior instructor in surgery at his alma mater; fellow of the American College of Surgeons; came to Mount Carmel Mercy Hospital as director of surgery in 1950, later assuming the duties of director of resident education, a position he held at the time of his death; specialist certified by the American Board of Surgery; died July 15, aged 43, in an automobile accident.

Benson, Adelbert Harold, Albuquerque, N. Mex.; Rush Medical College, Chicago, 1902; veteran of World War I; formerly associated with the Veterans Administration in Houston, Texas; died July 1, aged 77.

Bigelow, Coniah Leigh, Westwood, Calif.; Medical Department of the University of California, San Francisco, 1905; died in Susanville June 16, aged 78, of arteriosclerotic heart disease.

Brendel, John William, Avoca, Neb.; Lincoln Medical College of Cotner University, Lincoln, 1901; an associate member of the American Medical Association; died July 26, aged 76, of carcinoma of the lung.

Bruell, Frederic William ⚕ Margaretville, N. Y.; Ludwig-Maximilians-Universität Medizinische Fakultät, München, Bavaria, Germany, 1925; died June 14, aged 57, of heart disease.

Callister, Frances Eleanor, Laguna Beach, Calif.; Detroit Homeopathic College, Detroit, 1912; died in Los Angeles May 21, aged 86.

Carter, Edward Albert, Detroit; State University of Iowa College of Medicine, Iowa City, 1907; died in the Burton Mercy Hospital June 12, aged 74, of carcinoma.

Cawley, Aloysius John ⚕ Pittston, Pa.; Temple University School of Medicine, Philadelphia, 1925; on the staff of the Pittston Hospital; died June 23, aged 72, of coronary thrombosis.

Chambers, Charles Lewis ⚕ Des Moines, Iowa; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; died in Ellsworth, Maine, June 27, aged 86.

Champlin, Harry Howard, Ashfield, Mass.; University of Colorado School of Medicine, Denver, 1912; for many years practiced in New York City, where he was on the staff of the New York Polyclinic Medical School and Hospital; died in the Franklin County Public Hospital, Greenfield, June 15, aged 72, of cerebral thrombosis and arteriosclerosis.

Claridge, Ralph Alonso ⚕ St. Louis; Northwestern University Medical School, Chicago, 1909; a medical officer during World War I; served as medical advisor for the Travelers Insurance Company; died in the Alexian Brothers Hospital July 4, aged 69, of arteriosclerosis and heart disease.

Clothier, Samuel H., Paxico, Kan.; Kansas City (Mo.) Homeopathic Medical College, 1899; died June 7, aged 87, of coronary occlusion and carcinoma of the prostate.

Conly, Leonard Hudson, Key West, Fla.; Jefferson Medical College of Philadelphia, 1926; member of the Florida Medical Association and the American Academy of General Practice; died July 11, aged 55, of coronary thrombosis.

Conway, William Henry, Clarks Summit, Pa.; Baltimore Medical College, Baltimore, 1905; an associate member of the American Medical Association; senior physician at Clarks Summit State Hospital; died in the Scranton (Pa.) State Hospital June 22, aged 80, of coronary occlusion.

Cook, Charles Edward, Jr., Calais, Maine; University of Vermont College of Medicine, Burlington, 1908; served as city health officer; died in the Veterans Administration Hospital, Togus, June 9, aged 73, of bronchopneumonia and recurrent epidermoid carcinoma of the gum.

Coston-Conner, Laila Ann ⚕ New York City; University of Pennsylvania School of Medicine, Philadelphia, 1920; died July 2, aged 66.

Coulter, Lester McDonnell, Berkeley, Calif.; Trinity Medical College, Toronto, Ontario, Canada, 1899; veteran of World War I; served as health officer of Watertown, N. Y., and Stanislaus County, Calif.; died June 20, aged 85, of arteriosclerosis and cerebral thrombosis.

Crane, Carl Custer ⚕ San Francisco; Harvard Medical School, Boston, 1899; served on the staffs of the University of California, St. Francis Memorial, and Mary's Help hospitals; died July 1, aged 80, of a heart attack.

Crozier, Gordon Turner, Blountstown, Fla.; University of Georgia Medical Department, Augusta, 1907; past-president of the Georgia Health Officers' Association and secretary of the Georgia Public Health Association; while practicing in Valdosta, Ga., served as health commissioner of Lowndes County; a veteran of World War I; died June 30, aged 70.

⚕ Indicates Member of the American Medical Association.

Derrick, Howard Clifton ⊕ Oglethorpe, Ga.; Atlanta College of Physicians and Surgeons, Atlanta, 1902; served as a member of the county school board; died June 8, aged 77, of cerebral embolism.

Downing, Earl Ebert Raymond ⊕ Chicago; Bennett Medical College, Chicago, 1914; on the staff of the Walther Memorial Hospital; died Aug. 16, aged 72, of acute coronary occlusion.

Drummond, Winslow, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1894; an associate member of the American Medical Association; died July 10, aged 93.

Dulaney, Octavus, Louisville, Ky.; University of Nashville (Tenn.) Medical Department, 1901; an associate member of the American Medical Association; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; past-president of the Tennessee State Medical Association; served on the faculty of the University of Louisville School of Medicine; at one time on the medical staffs of Kentucky Baptist Hospital, Norton Memorial Infirmary, and St. Anthony Hospital; died June 17, aged 77, of a heart attack.

Earp, Ralph Bowman ⊕ El Dorado, Kan.; Central College of Physicians and Surgeons, Indianapolis, 1897; on the staff of the Susan B. Allen Memorial Hospital, where he died June 25, aged 81, of diverticulitis and intestinal obstruction.

Eastlake, Chesmore ⊕ Denver; University of Colorado School of Medicine, Denver, 1922; on the staffs of St. Joseph's and Childrens hospitals; died June 20, aged 63, of heart disease.

Eichman, Edward A. ⊕ Philadelphia; Jefferson Medical College of Philadelphia, 1905; on the staff of the Germantown Dispensary and Hospital; died July 23, aged 74, of myocardial infarction.

Elder, Lindsay H., Bogart, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1913; served as mayor of Bogart, and for many years a member and chairman of the county board of education; died in the Piedmont Hospital, Atlanta, July 4, aged 69, of gastric hemorrhage.

Elliston, LeRoy Bertram ⊕ Fort Lauderdale, Fla.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, Chicago, 1909; veteran of World War I; on the staff of the North Broward General Hospital; died June 18, aged 71, of nephrosclerosis and arteriosclerosis.

Farmer, Charles Hall ⊕ Macon, Ga.; Emory University School of Medicine, Emory University, 1921; at one time vice-president of the Medical Association of Georgia; fellow and past state chairman of the American Academy of Pediatrics; past-president of the Georgia and Macon Pediatrics societies; specialist certified by the American Board of Pediatrics; consulting physician, Macon Hospital; died June 23, aged 61, of coronary occlusion.

Funderburk, Isaac Sheppard ⊕ Cheraw, S. C.; Atlanta School of Medicine, Atlanta, Ga., 1910; served as mayor of Cheraw; on the courtesy staff of Marlboro County General Hospital in Bennettsville; died July 4, aged 73, of coronary thrombosis.

Gaumer, George Williams ⊕ Oreland, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1935; veteran of World War II; served on the staff of the Abington (Pa.) Memorial Hospital; died in the Methodist Episcopal Hospital, Philadelphia, July 16, aged 45.

Hess, Delbert Melroy, Washingtonville, Pa.; College of Physicians and Surgeons, Baltimore, 1902; served as president of the Columbia County Medical Society; died in the George F. Geisinger Memorial Hospital and Foss Clinic, Danville, July 18, aged 87, of carcinoma of the pancreas.

Hoffmann, Sterling Peter ⊕ Fort Wayne, Ind.; Indiana University School of Medicine, Indianapolis, 1912; veteran of World War I; died in the Lutheran Hospital July 4, aged 71, of cerebral thrombosis and arteriosclerosis.

Hohanshelt, Anna S. ⊕ Rosemead, Calif.; College of Physicians and Surgeons, Los Angeles, 1919; died in Indianola, Iowa, Aug. 8, aged 63, of cancer.

Hollands, William Howard ⊕ Fisher, Minn.; Minneapolis College of Physicians and Surgeons, Minneapolis, 1908; past-president of the Red River Valley Medical Society; served two terms as mayor of Fisher, and on the council; formerly health officer; died in St. Francis Hospital, Crookston, July 13, aged 75, of cancer of the liver.

Hooker, Lynn Collins ⊕ Carthage, Texas; University of Texas School of Medicine, Galveston, 1932; died July 18, aged 49, of heart disease.

Houser, Blanche Wanda ⊕ Cedar Rapids, Iowa; State University of Iowa College of Medicine, Iowa City, 1938; member of the American Society of Anesthesiologists; on the staffs of St. Luke's Methodist and Mercy hospitals; died July 10, aged 45, of leukemia.

Howell, Ezekiel, Telford, Tenn.; Lincoln Memorial University Medical Department, Knoxville, 1914; died in Johnson City June 29, aged 72.

Hudson, Elmer M., Little Rock, Ark.; University of Louisville (Ky.) Medical Department, 1890; fellow of the American College of Surgeons; died June 27, aged 87.

Kelley, Ernest J., Chandlers Valley, Pa.; University of Buffalo School of Medicine, Buffalo, 1891; an associate member of the American Medical Association; died July 13, aged 92.

King, Myron Louis ⊕ Brookline, Mass.; Harvard Medical School, Boston, 1898; served on the staff of the Mount Auburn Hospital in Cambridge; died July 26, aged 84, of carcinomatosis.

Koehler, Charles George, Jr., Brooklyn, N. Y.; Cornell University Medical College, New York City, 1906; served on the staff of the Wyckoff Heights Hospital; died in the Brooklyn Hospital July 20, aged 72, of a heart attack.

Krug, Frederick H., St. Louis; St. Louis University School of Medicine, St. Louis, 1905; examining physician for the draft board during World Wars I and II; on the staffs of the Shriners Hospital for Crippled Children, Missouri Baptist Hospital, and Incarnate Word Hospital; died July 15, aged 87, of cancer of the lung.

Ladden, John Joseph ⊕ Philadelphia; Jefferson Medical College of Philadelphia, 1932; on the staff of the Nazareth Hospital; killed July 23, aged 50, in an automobile accident.

Lakeman, Mary Ropes ⊕ Salem, Mass.; Boston University School of Medicine, Boston, 1895; served as northeastern regional director for the Women's Field Army of the American Society for the Control of Cancer; retired Dec. 1, 1937, from the Massachusetts Department of Public Health, with which she was associated for 20 years in child and adult hygiene work; died June 26, aged 86.

Littell, George Shaum ⊕ Dallas, Texas; Washington University School of Medicine, St. Louis, 1926; certified by the National Board of Medical Examiners; specialist certified by the American Board of Pediatrics; member of the American Academy of Pediatrics; veteran of World War II; served on the staffs of the Veterans Administration hospitals in various places; at one time on the faculty of Baylor University College of Medicine; on the staffs of the Methodist Hospital and the Children's Medical Center; died July 17, aged 54, of coronary infarction.

McCray, Elwood H. ⊕ Malvern, Ark.; Beaumont Hospital Medical College, St. Louis, 1901; died July 7, aged 79, of acute cardiac failure.

McNaughton, Guy Peery ⊕ Miami, Okla.; Memphis (Tenn.) Hospital Medical College, 1912; served overseas during World War I; died in the University of Kansas Medical Center, Kansas City, Kan., May 21, aged 68.

Meek, Eleanor Grace ⊕ Denver; University of Colorado School of Medicine, Denver, 1950; interned at the Colorado General Hospital; formerly a resident at the Veterans Administration Hospital in Fort Logan, Colo.; member of the staffs at St. Luke's, St. Joseph's, Presbyterian, Mercy, and General Rose Memorial hospitals; died in St. Luke's Hospital May 28, aged 46, of bronchopneumonia and cor pulmonale.

Otis, John ⊕ Parma, Ohio; Western Reserve University School of Medicine, Cleveland, 1943; specialist certified by the American Board of Psychiatry and Neurology; member of the American Psychiatric Association; veteran of World War II; on the staff of the Veterans Administration Hospital; died in Cleveland June 10, aged 44.

FOREIGN LETTERS

BELGIUM

Medical Research.—At a meeting of the Royal Academy of Medicine, the attention of the government was drawn to the present critical situation of medical researchers, and the creation of a national foundation for medical research was urged.

Post-Traumatic Osteoporosis.—At the 10th Belgian Congress of Surgery, held in May, Belenger stated that post-traumatic osteoporosis results from the persistence of a vasomotor disorder created and maintained by a focus of irritation in the spine. Its severity is not proportionate to the severity of the trauma. It is observed more often in subjects presenting psychic instability or marked vegetative dystonias, who hold the wounded member as immobile as possible or complain of pain at the slightest movement. Treatment must take these factors into account. The condition is improved by measures that establish vasomotor and circulatory equilibrium. Post-traumatic osteoporosis, however, is only one of the symptoms of post-traumatic disease. For example, small muscular atrophies may be associated with a marked osteoporosis, or extensive edema may be associated with minimal osseous rarefaction. Osteoporosis and related phenomena can be largely prevented by early and skillful repair of the traumatic lesion. It is necessary to immobilize the affected region and to see that all other regions are mobilized. It is necessary to reduce pain and edema by elevating the injured part. If these preventive measures are unsuccessful, operation on the sympathetic nerves may be tried.

Sanitary Collaboration.—A sanitary commission composed of governmental delegates of the Benelux countries was inaugurated by Professor De Laet, general secretary of the Ministry of Public Health, following a decision of the Counsel of Ministers of these countries. Three divisions were created, having jurisdiction over pharmaceutical products, meats, and the shipping of foodstuffs respectively. The ministerial delegates will meet at The Hague to outline the mutual aid of the three countries in the prevention of poliomyelitis, the protection of the population against the effects of industrial nuclear energy, and the control of habit-forming drugs.

Epilepsy.—At the meeting of the Belgian Association of Hygiene and Social Medicine in May, Sorel of Louvain said that the physician should envisage the medicosocial situation of the epileptic patient. He should study his behavior as much between as during the crises. The crisis itself alway appears in the same way in the same patient. The milieu (office, class) can therefore adapt itself to these manifestations. The epileptic's chances of social adaptation between crises are conditioned by his intelligence, memory, and personality, all of which are frequently normal. Personality also is often altered. The atmosphere of the family circle and the efficacy of medical control of seizures have an important influence on the personality. Some of the psychic obstacles to normal personality development are (1) refusal by the patient to recognize his illness and, consequently, to cooperate in treatment or advice of a social nature; (2) excessive urging by the parents toward studies beyond the patient's capabilities; and (3) refusal by employers or teachers to make allowances for the patient's condition.

BRAZIL

Subtotal Gastrectomy with Gastroduodenal Anastomosis.—Paulino and Ferreira (*Rev. brasilo cir.* 31:565, 1956) reported a series of 64 subtotal gastrectomies with gastroduodenal anastomosis (Billroth 1). Besides being more physiological, the reconstruction of the digestive tract by means of this anastomosis permits a better utilization of the first jejunal loop, whose capacity of absorption is much higher than that of the rest of the jejunum. In spite of this the Billroth 1 operation is rarely used, a marked preference being given to gastrojejunal anastomosis. Since certain technical difficulties of the gastroduodenal anastomosis may explain the abandonment of the Billroth 1 operation, the authors believe that the publication of their results may help to revive interest in this procedure. The age of the patients varied from 28 to 78 years (average 59). The average postoperative stay in the hospital was 9.5 days (range 6 to 34 days). There was only one death, which occurred in a patient with cachexia who did not have adequate preoperative care.

Owing to the short time of observation of their patients, the authors limited their report to the problems of surgical technique. They believe the Billroth 1 operation can easily be used in 80% of the patients with peptic ulcer. The operation was performed in brachymorphic as well as in obese patients and also in patients with juxtacardial ulcers and in those with ulcers penetrating the pancreas. An important technical point in the Billroth 1 operation is the freeing of the duodenum together with the head of the pancreas. In some patients there is destruction and infiltration of the posterior wall of the duodenum, for which Von Haberer suggested and Moore and Harkins used the suture of the duodenum and the anastomosis with the anterior surface of the organ in the longitudinal direction. In such patients the authors modified the technique, performing the anastomosis of the stomach with the second part of the duodenum, which is opened transversely. This procedure not only makes the operation easier but also is a better approximation to the terminoterminal anastomosis technique. As for the anastomosis itself, the authors maintain careful hemostasis of the submucosal vessels by means of transfixing ligation of each vessel and careful joining of the mucosas, using fine chromic absorbable surgical sutures with an atraumatic needle.

Anesthesia is induced with pentothal and then maintained with curare, nitrous oxide, and oxygen. Preoperative gastric intubation is maintained until 24 or 48 hours after the operation. A pararectal incision is used. Duodenopancreatic mobilization is essential. The colon is freed and moved downward. The duodenum and the head of the pancreas are moved to the left, permitting an easier dissection of the ulcer. Before the opening of the duodenum, the organ is clamped with a forceps with slender blades, to prevent the spilling of duodenal fluid and to serve as a support during the posterior suturing of the gastroduodenal anastomosis. The first two planes of suture of the gastric defect act as a means of securing hemostasis. After the closing of the stomach in two layers, invaginated separate stitches cover the hemostatic sutures.

Retinopathy in Diabetes.—Mattos and co-workers (*Rev. Hosp. clin.* 11:83, 1956) reported a study of the clinical significance of retinopathy in diabetes. With the advent of insulin, the survival of diabetics was greatly prolonged, thus allowing an increased incidence of vascular complications. In the authors' series of 72 cases, the duration of the disease varied from 1 to 10 years. Control of the diabetes was excellent or good in none, fair in 34, and poor in 38. The authors classified the severity of the retinopathy as follows: first degree—capillary microaneurysms, accentuation of the sinuosity, turgor of the veins and small hemorrhages or petechiae; second degree—accentuation of the above signs in both eyes, small white spots with clear limits, round or flame-shaped hemorrhages; third degree—accentuation of the above signs, macroaneurysms of the great veins, and newly formed vessels; and fourth degree—hemorrhage in the vitreous, proliferative retinitis, hemorrhagic glaucoma, and detachment of the retina. The authors believe that this classification will facilitate an easy understanding between the internist and the ophthalmologist. Of the 43 patients in whom the disease had been present from one to five years, 25 did not present any alteration

---

The items in these letters are contributed by regular correspondents in the various foreign countries.

of the fundus oculi and 3 had a first-degree, 12 a second-degree, 2 a third-degree, and one a fourth-degree retinopathy. Of the 29 patients in whom the disease had been present 6 to 10 years, 6 had a normal fundus and 7 had a first-degree, 12 a second-degree, and 4 a third-degree retinopathy. Of the total series, 30 had arterial hypertension, and, of these, 6 had no diabetic retinopathy, while 3 had a first-degree, 12 a second-degree, 8 a third-degree, and one a fourth-degree retinopathy. The authors confirmed previous reports that the duration of diabetes is a decisive factor in the degree of severity of diabetic retinopathy, but they believe there is no significant difference in the degree of retinopathy in the groups with fair and poor control of the disease.

DENMARK

Barbiturate Poisoning.—The many publications in the medical press on the treatment of barbiturate poisonings bear witness to the revolution effected by the centralization of such cases in a special hospital since 1949. Since that time the case fatality rate has been reduced from about 25 to 3%. Myschetzky found that, of 109 barbiturate deaths, about 33% were due to pulmonary complications, another 33% to cardiac complications, and the rest to failing renal function or protracted shock, in equal proportions. *Ugeskrift for læger* for July 5 contains several articles showing what is being done to reduce this residual mortality. Some of these articles give an appraisal of the treatment introduced in 1954 by Shaw and co-workers. It consists of the intravenous injection of a combination of Megimide and Daptazole. Between September and December, 1955, 24 patients with severe barbiturate poisoning were treated at the Bispebjerg Hospital with Megimide. Reporting on these cases, Louw and Sonne said that Megimide had a definitely stimulating effect on reflex activity and on respiration, but they could not discover any acceleration of the elimination of the poison or curtailment of the duration of coma. Their provisional impression did not support the theory of an antagonist effect. In another article Dr. J. Kjaer-Larsen stated that, of the first 50 patients treated at the Bispebjerg Hospital with Megimide, 15 became psychotic and 16 had cramps. These psychoses closely resembled the clinical picture provoked by the withdrawal of barbiturates, and it was chiefly the barbiturate addict who was most liable to react in this way. Though the psychoses did not last long, they were disquieting and should be taken as a warning against any indiscriminate use of Megimide.

Accessory Nipples.—New light on the old problem of accessory or supernumerary nipples has lately been thrown by two independent observers. Dr. Harald Boas in *Ugeskrift for læger* for May 17 states that, when he took charge of the skin department of a large hospital 23 years ago, he examined every new patient for this anomaly. Of 6,456 patients examined, 121 had one or more accessory nipples. In 97 of these there was only one accessory nipple. More were on the left than on the right, and there were more than twice as many accessory nipples in men than in women. All were below the level of the normal nipple, and none was found on the thighs or back. These findings do not support the theories that this condition (1) is associated with tuberculosis, (2) is often associated with various other degenerative stigmas, and (3) is a hereditary phenomenon. In the July 5 issue of the same journal, Dr. Holger Holm says that since 1949 he has kept a careful record of such cases among school children and of 4,315 examined he found 133 with accessory nipples. Boys were in the majority, with an incidence of 4.26%, and the corresponding percentage for girls was 3.58. The preponderance of accessory nipples on the left over those on the right was even more marked than in Boas's material. Holm asks why he has twice as high an incidence of such cases as Boas and most other observers and suggests that the difference may be due in part to the fact that examinations of school children are frequently repeated. Thus, in several cases he did not discover an accessory nipple until the same child had been examined three or four times. He has never known an accessory nipple to disappear spontaneously.

NORWAY

Tests for Blood Alcohol.—The motorist whose blood is found to contain more than a certain amount of alcohol after a traffic accident risks a heavy prison sentence. Last May a traffic accident showed how complicated this risk can be. After a collision between a motorcyclist and a motorist, the former was admitted to Ullevaal hospital with a broken leg. The motorist submitted to a blood alcohol test and asked that the motorcyclist also do so. The motorcyclist refused, and the physician on duty in the hospital did not insist on carrying out the test. Nor did the hospital take measures to allow the police to employ some outside physician to take this test *nolens volens.* The police protested, their formal complaint being lodged not only with the Ministry of Justice but also with the Ministry of Health. In theory the matter is quite plain. The Norwegian motor traffic law lays down clearly enough that the driver of a motor vehicle is bound to submit to a blood alcohol test under certain conditions. These conditions are now being more clearly defined in order to meet the situation in precisely such cases as the above. The Ministry of Health has issued a statement reminding physicians of their responsibilities to both patient and state. Every case must be judged on its own merits, but any demanded blood alcohol test must be subordinated to any emergency operation a patient requires. Hospitals should provide legitimate facilities for the taking of this test at the request of the police. It may be well, under certain conditions, to let the police employ physicians other than those on a hospital staff to carry out this test. In a commentary on the subject, Prof. Axel Ström draws attention to a semiofficial draft of a new law that may be enacted if it is not effectively denounced. According to this draft, Norwegian physicians may incur legal penalties if they refuse to undertake a blood alcohol test against the wishes of the patient on the bidding of the police. Ström believes that a physician should never be forced by the authorities to operate on a patient without the physician being free to decide whether he should do so.

Seropositive Syphilis.—One of the functions of the serodiagnostic department of the Norwegian State Institute for National Health is the Rh-typing of blood of the husbands of Rh-negative pregnant women. In the course of such typing, the opportunity is taken to test the sample of blood for syphilis. Between Jan. 1, 1951, and July 16, 1955, a total of 16,489 samples were thus tested, and in 87 cases one of the serologic tests for syphilis was positive. In 64 of these cases there could be no doubt as to the diagnosis of syphilis, and Dr. J. Eng, who reports on this study in *Tidsskrift for den norske lægeforening* for June 15, concludes that about 0.44% of the subjects tested were syphilitic. Thirty of the 64 already knew they were syphilitic. The value of this study is enhanced by the facts that the sampling was random, in that the persons examined were not more likely to be infected with syphilis than any other group of married Norwegians, and that the samples came from all over Norway. As a result of his findings, Dr. Eng urges routine premarital examination for syphilis for both men and women, a precaution already in force in many countries.

PORTUGAL

Symposium on Collagen Diseases.—At a meeting of the Medical Society of the Lisbon Hospitals, attended by many physicians from other countries, Prof. G. Favilli, of Bologna, Italy, said that collagen pathology is synonymous with intercellular pathology. The ground substance is of primary importance in the pathogenesis of such degenerative reactions as mucoid and fibrinoid degenerations. It has relations with the endocrine system and has an important role in the beginning of acute inflammation and in the malignant degeneration of epithelial surfaces. Elastosis is the most important lesion of the fibrillary part of connective tissue. Prof. Raymond Garcin, of Paris, said that the nervous manifestations of periarteritis nodosa resulted mainly from peripheral nerve lesions such as multineuritis and polyneuritis and that those of systemic lupus erythematosus (convulsions and psychic disturbances) resulted mainly from lesions of the central nervous system. In general, changes in the small blood vessels are responsible for such manifestations as ischemic neuritis and cerebromalacia, but in the brain certain parenchymatous changes may be caused by distant visceral lesions. High blood pressure and renal insufficiency in patients with periarteritis nodosa may also cause brain damage. Psychic disturbances and convulsions may even be due to treatment with corticosteroids. In polymyositis the problem is a peculiar one: muscles and connective tissue participate in the disease, but nerves are free and blood vessels participate but slightly. If the origin is vascular, then it is a purely functional phenomenon, in the sense of a serous inflammation.

UNITED KINGDOM

Employment of Older Persons.—At the third annual conference of advisory councils on occupational health in B.M.A. House in April, it was agreed that (1) steps should be taken to encourage the employment of older persons, (2) the type of work, hours, and working conditions should be adapted to suit the health, physical fitness, and mental capabilities of the worker, due regard being paid to the ordinary physical problems that attend advancing age, and (3) if fit and willing older people were not able to remain at work, to find work, or to use their experience and qualifications to the full, there would be great hardship to the persons concerned and a loss of manpower and skill to the country. In an annotation in the May 5 issue of the *British Medical Journal* it is stated that, through the efforts of some 140 employment exchanges in all parts of the country, 537 of more than 1,100 elderly men had found jobs as watchmen, cleaners, sweepers, porters, handymen, gardeners, and park, cinema, and elevator attendants. A group of 118 men found light work in factories, and a few were taking preliminary training courses to fit them for a new type of work. Many men registered as disabled and over the age of 60 have shown themselves readily adaptable to a suitable occupation. It is evident that we must begin to think in terms of jobs where pace need not be a primary consideration.

Better Use of Health Centers.—A large reduction in the cost of providing health centers could be made, according to a report by the Local Medical Committee for London. The most important step is to make sure that full use is made of the rooms provided. For example, consulting rooms could be used for antenatal and infant welfare clinics between morning and evening office hours For a general practitioner's suite to be used for only about six hours a week is wasteful. So far, patients have shown no preference for the health center as against the physician's private office Apart from natural conservatism this might be due to dislike of an institutional building or fear of lack of privacy and lack of a congenial atmosphere owing to staffing difficulties A group practice examined by the committee was more successful than any of the four health centers examined. There is no reason why a group of physicians in partnership should not provide an equally good service at a health center, and there is an urgent need for further health centers where this experiment could be tried.

Alcoholism and Mortality.—The *British Medical Journal* of June 9 states that the death rates from cirrhosis of the liver and alcoholism in many countries have recently been tabulated by the World Health Organization. Variations in the standards of reporting between countries introduce some uncertainty into international comparisons, and the several revisions of the international classification of the causes of death make comparison over the years difficult. Moreover, exact comparison over a number of years necessitates standardization of the rates by age, since the average age in most countries is increasing and cirrhosis of the liver is mainly a disease of later life. Finally, diagnosis has become more precise in most countries. Despite these difficulties the trends of the death rate do give a broad picture of variations in this aspect of social life within and between countries in the past 50 years. The number of deaths annually from cirrhosis of the liver in England and Wales declined from over 4,000 in 1901 to about 800 in the period 1942 to 1949 (while the population increased by about 25%), but they increased to just over 1,100 in each of the years 1951 to 1954. The highest recorded European death rates from this cause in 1954 were those of France, 36.7 per 100,000 men and 20.2 per 100,000 women. The rates in England and Wales were only 3 for men and 2.3 for women. Austria had an exceptionally large sex difference, with a rate of 20.7 for men and 7.5 for women. In the United States the death rates were 14.7 for white men and 7.1 for white women; for the nonwhites the corresponding rates were 8.5 and 5.2.

The number of deaths attributed to alcoholism in England and Wales dropped from 3,131 in 1901 to 34 in 1954. In the United States the number of deaths during this period rose from about 1,000 to about 2,500, though the population also increased (by about 100%). Many countries, including France, have no data from the early years of this century, but in 1954 the number of deaths from this cause in France was 4,106. In 1954 the death rate per 100,000 was only 0.1 for both sexes in England and Wales, and in Scotland the rates were 0.6 for men and 0.2 for women. In France the rates were 14.5 for men and 5 for women, and in the United States (1953) the corresponding rates for whites were 2.4 and 0.4 and for nonwhites 5 and 1.4.

Rheumatism.—In the annual report for 1955 of the department of rheumatology of the Royal Free Hospital, London, some details are given of the follow-up on all patients seen in the department since it was opened in 1947. Of the 921 patients discharged in this eight-year period, 228 (25%) have been lost sight of. An analysis of the figures shows that about 75% of those admitted as inpatients for rheumatoid arthritis, 50% of those with ankylosing spondylitis, and 80% of those with osteoarthritis do not need readmission for at least three years. In the case of rheumatoid arthritis, as the interval after discharge increased there was a tendency for the proportion of those who maintained improvement and of those whose conditions deteriorated to decline, while the proportion remaining in status quo increased, so that, whereas at the end of the first year only 34% were in status quo, by the end of the eighth year 63% were in this category. In ankylosing spondylitis the proportion that maintained improvement continued fairly constant in each successive year after discharge at between 50 and 60%, but the proportion of patients with osteoarthritis who maintained improvement tended to fall while the proportion remaining in status quo increased, giving a similar result to that in rheumatoid arthritis.

Further investigations have been carried out into the conditions of isolation of the mucoprotein fractions M-1 and M-2. The estimation of mucoproteins by the scanning of stained strips was investigated, and the results were encouraging. Electrophoresis of concentrated urine has revealed the presence of fractions with very high mobilities that appear to be similar to the polypeptides recently reported in cerebrospinal fluid. The mucoprotein fractions of urine exhibit the same electrophoretic mobilities as those in serum. In the course of studying their position in the pattern obtained by electrophoresis at pH 8.6, this pattern was subjected to a second electrophoretic analysis at pH 4.6 at right angles to the first. The two-dimensional analyses revealed heterogeneity of both M-1 and M-2 in the serum and urine of patients with acute rheumatoid arthritis. The serum of normal subjects exhibited heterogeneity of M-2 but not of M-1. The levels of the fractions in normal urine are too low to enable them to be studied in this manner. A quantitative study of coprecipitation of mucoproteins when serum proteins are precipitated with sulfosalicylic acid has been carried out in serums of three patients with acute rheumatoid arthritis. The recovery of M-1 was essentially 100%, and that of M-2 ranged from 30 to 60%.

Following the publication of the article by Morris Ziff and co-workers, from the New York University College of Medicine, claiming that 92% of adult patients with peripheral rheumatoid arthritis showed a positive agglutination test with Rose's euglobulin test while only 2% of the controls had positive results, a series of tests was carried out using their modification of this test. The drawback of the Waaler-Rose sensitized-sheep-cell agglutination test, in the hands of the workers at the Royal Free Hospital, had been a failure of positivity in about 40% of patients with active rheumatoid arthritis. With the modified method, 64 (91.4%) of 70 patients with proved cases of rheumatoid arthritis showed positive agglutination tests with the euglobulin fraction. Three of the six cases where results were negative were considered clinically inactive. Three patients with psoriasis and arthritis had negative results. Analysis of the results in rheumatoid arthritis indicate that the agglutination titer is higher in women, in patients over 60, in those whose arthritis has been present over four years, in those with severe activity, and in those with a high sedimentation rate.

The Preceliac Syndrome.—In *Proceedings of the Royal Society of Medicine* (49:391, 1956) Guy Daynes reports 40 cases of what he describes as the preceliac syndrome. In a typical case, a child, aged 1 to 5 years, becomes irritable and refractory a few days after the onset of an acute infectious illness such as measles. Sleep is disturbed, appetite fails, the abdomen becomes distended, and the stools become pale, bulky, and offensive. The condition usually subsides in a month or two, but if it persists petit mal–like attacks may develop. There is a dramatic response when these children are put on a gluten-free diet. Relapse occurs if a premature return to a normal diet is made. Sleep disturbances are the common presenting symptom. The dramatic response to a gluten-free diet and the similarity of the syndrome to canine hysteria has led Daynes to regard this syndrome as the counterpart in humans of canine hysteria. He believes that the syndrome is the result of a sensitivity to a digestion product of wheat flour at a time when patients are specially likely to develop this, i. e., when they have an infection that can cause cell damage. He does not believe that the changes he has described are the result of direct toxic action by the pathogen after the illness. He postulates that damage to nerve tissue can be followed by sensitization to certain common allergens and that, once caused, such sensitization can be temporary only provided the allergen is withdrawn early. He suggests that patients with petit mal, behavior and sleep disorders, reactive depression, recurrent headache, and insomnia might be reexamined with this syndrome in mind. Because of the relationship between the syndrome and bread, he wonders whether it may be due to the modern chemical treatment of flour. He does not believe that the syndrome is due entirely or directly to agene. The severest reactions have been precipitated by stale wheat flour, which suggests that the basic toxic allergen may be found in the staling process of flour and flour products.

Myelomatosis.—In *The Practitioner* (vol. 177, August, 1956) E. M. Buzzard reviews a series of 46 proved cases of plasma cell myeloma (myelomatosis). None of the patients was under the age of 41, and the average age at the time of diagnosis was 60. Thirty of the patients were men. The presenting symptom was pain in 35 patients, and, as this was usually skeletal rather than visceral, it was usually diagnosed initially as due to rheumatism. This probably explains why there is such a long interval between the onset of symptoms and the correct diagnosis—an average of 16 months in this series. The commonest site for the pain is the back; other common sites were the hips, thigh, and ribs. Nine patients were admitted to the hospital with symptoms and signs of spinal-cord compression and four with a pathological fracture. The presenting symptom in the 11 who did not complain predominantly of pain was debility. Abnormal radiological appearances of the skeleton were present in 24 of the 34 patients on whom x-ray examinations were made. Thirteen of them had collapsed vertebrae, and a further 12 had generalized bony changes, particularly in the skull, ribs, and pelvis. Twenty-three patients were anemic on admission, levels of 7.4 to 8.9 gm. of hemoglobin per 100 cc. being common.

Hyperglobulinemia was found in 32 patients, and the bone marrow showed diagnostic changes in 23. Bence-Jones protein was present in only 14 and was found only in the late stages of the disease. Treatment is symptomatic and unsatisfactory. Deep x-ray therapy to the painful bony sites may give temporary relief. Stilbamidine isethionate has little or no specific effect. Laminectomy and decompression for paraplegia, followed by deep x-rays and some form of spinal support, are always worthwhile and often effective temporarily. Salicylates are the most effective analgesic for bony discomfort and pain. The prognosis is hopeless, but the patient may live 10 days or 10 years. The significant feature in Buzzard's series was how often a patient died within days or, at most, weeks of admission. Death from uremia and congestive heart failure was common.

Bureaucratic Bumbledom.—*The Chemist and Druggist* reports an example of "pedantic nonsense." Under the Food and Drugs Act a drug to be tested is divided into three parts: one each for the analyst of the local authority, the government chemist, and the independent analyst selected by the retailer. Last October, a Surrey pharmacist, in dispensing a test prescription for 40 penicillin lozenges, supplied two tubes of 20 lozenges each in the manufacturer's original sealed tubes. In dividing the sample the two tubes were opened, and seven lozenges were taken from one and six from the other and placed in a third container. The reports of all three analysts showed a deterioration in potency of the lozenges, whereas the manufacturers reported that tests of the same batch of lozenges in their possession were satisfactory. The pharmacist claimed that the breaking of the original seal was responsible for the loss of potency, and his claim was accepted by the executive council with which he was under contract. The executive council further recommended that testing arrangements should be modified to ensure that seals of original containers should not have to be broken in order to provide the samples for analysis. This reasonable suggestion the Minister of Health has categorically rejected, a decision that *Chemist and Druggist* describes as "an unhappy example of bureaucratic unreasonableness and stupidity."

The Complications of Measles.—A study group of the College of General Practitioners published a report on the complications of measles as a supplement to the college's *Research Newsletter* no. 11. It is based on the findings in 2,728 cases. In severe cases of measles the complication rate was between 3 and 10 times as great as in mild cases. Age by itself did not directly affect the complication rate for measles of any given severity, but in children under the age of 2 years pulmonary complications were commoner than aural complications. In children unusually susceptible to respiratory infections the risk of complications was doubled, even after a mild attack of measles. If, at the first visit to a patient with a straightforward case of measles, abnormal physical signs, especially in the chest or ears, are present, the risk of complications is increased threefold in a case of average severity. The prophylactic use of sulfonamides or antibiotics confers little, if any, benefit in mild cases and in cases of ordinary severity, and may even do harm. In severe cases some benefit may be obtained from their use. They can be of benefit to children who are in poor health when they contract measles, especially if they are highly susceptible to respiratory disease or have abnormal physical signs at the onset of the measles. If pulmonary complications are anticipated, the drug of choice is an antibiotic. If otitis media is present or expected, sulfonamides may be of more benefit than antibiotics. If an antibacterial drug is required for a previously healthy child under the age of 2 years, an antibiotic rather than a sulfonamide should be given, as pulmonary, rather than aural, complications are more likely to occur. There is nothing to commend the routine use of sulfonamides, since this increases rather than reduces the total complication rate. The routine use of antibiotics in measles is expensive and largely unnecessary.

Pathologists' Jubilee.—The Pathological Society of Great Britain and Ireland held its 50th meeting at Manchester, where the inaugural meeting was held in 1906. In its early days the society drew its membership largely from the Scottish and provincial medical schools. This was partly because pathology departments were more highly developed in these schools than in the London medical schools. To the pathologist today, the Pathological Society of Great Britain and Ireland and *The Journal of Pathology and Bacteriology* are practically synonymous, because within less than a year of the foundation of the society the journal became its official organ. The society has always maintained a sturdy independence of medical politics and an avoidance of frills. It has no permanent president. The rule is that the chair is taken by the head of the laboratory in which the meeting is being held. The society refuses to send delegates to conferences. Attempts have been made at different times to involve the society in medical politics, but these have always been successfully resisted. It has consistently adhered to its original purpose—to advance pathology and to facilitate communication between pathologists

Complaints Against Physicians.—The Minister of Health stated that about 2,800 complaints have been received against physicians in the National Health Service. The investigation of 2,508 of these has been completed. In 7, the physician's name was removed from the medical lists of executive councils; in 355, sums of money were withheld from the physician's pay; in 81, other action was taken, such as the reimbursement of expenses incurred by patients; in 301, the physician's attention was drawn to a breach of his terms of service; and in 1,764, no action was necessary.

CORRESPONDENCE

LOW-PROTEIN OBESITY DIETS

To the Editor:—May I commend THE JOURNAL for its excellent coverage, especially in the Aug. 25, 1956, issue, of the low-protein obesity diets publicized recently in lay magazines. Notable was the scholarly, thorough, and readable review by Dr. Jolliffe (page 1633). One factor perhaps deserves special emphasis—the influence of appetite, or lack of it. While anorexia is prevalent in malnutrition, the opposite is true in obesity, and therefore anything that decreases appetite is of obvious importance in the treatment of obesity. Dr. Jolliffe quoted Streick, who found that, when the protein intake was reduced from 28 gm. per day (the minimum for nitrogen balance) to 23, the subject "developed loss of appetite," and Dole and his co-workers, who showed in their obese subjects that an intake of 30 to 40 gm. of protein per day resulted in a loss of appetite. This certainly has been my own observation in many surgical patients subjected unknowingly to partial or complete protein starvation. In an earlier study by Dole and his co-workers of various restricted diets in patients with hypertension (*J. Clin. Invest.* 32:185, 1953), it was only the low-protein diets that led to anorexia. Thus, it seems that obese persons are no exception to the rule that a low-protein intake leads to anorexia and, thus, to a lower food intake. After all, starvation, even if incomplete, has long been known to lead to a loss of body weight. Many years ago a high-protein diet was also touted for the treatment of obesity. It was extolled in terms of "eat all the meat you wish." The gimmick was that absolutely no salt could be added, which, of course, made the food so tasteless few would eat much of it. I wonder whether the "compulsive dieters," to use the term of Jolliffe, actually developed a salt deficiency on such a diet. Editors of lay magazines, as well as obese persons who read them, should, of course, consult reputable authorities before accepting fads and fancies as established facts. Publishers, it seems, should have enough of a sense of responsibility in public relations to avoid purveying wishful thinking in their attempts to fulfill the natural curosity of their readers for medical knowledge.

A MODE OF TRANSMISSION OF VIRAL HEPATITIS

To the Editor:—Acute hepatitis can be spread by minute amounts of infective matter; as little as 1 cu. mm. can transmit the disease. Cold chemical sterilization of surgical instruments is practiced widely (it is used commonly for scissors and also for any instruments that must be sterilized during an operation), but the virus of homologous serum hepatitis is reported to be destroyed only by heat. The virus may possibly be destroyed only by prolonged exposure to solutions for sterilizing instruments; a four-hour exposure has been said to be minimal, but common practice in the operating room consists of less than one-eighth of this time (10 minutes is often used). Once an incision has been made in the skin, all instruments are equally hazardous, and the mechanism recognized in syringe hepatitis is brought to the operating table with cold sterilization. The following suggestions are therefore made. 1. Homologous serum hepatitis may be spread from patient to patient by failure to heat-sterilize surgical instruments, since they are invariably exposed to blood and other fluids and subcutaneous tissues. 2. The role of blood transfusion in causing serum hepatitis may be exaggerated, since transfusion and surgery commonly go together. 3. All instruments used in surgical procedures should be sterilized by heat sufficiently intense and administered for a long enough time to destroy the virus.

BOOK REVIEWS

To the Editor:—With reference to a review in the July 28 issue of THE JOURNAL, page 1341, of a book, "Allergy in Childhood," by Jerome Glaser, I should like to make the following comments. The book was castigated by the reviewer and not one part was singled out for commendation. There may be certain parts that the reviewer could have taken issue with, but the book is replete with sound information. The subject of allergy is most complex, and no one can be expected to do justice to all its phases. This book represents what Glaser, who has had wide experience, thinks of pediatric allergy. It is highly practical and will serve a useful purpose. I am certain that many allergic children will be benefited because of the information that can be gleaned from Glaser's volume. Allergy in children is perhaps the most neglected field in medicine, and I am sure that this volume will help to focus more attention on this subject. When an author writes a book or article he exposes himself to criticism and must accept it whether it is favorable or not. On the other hand, a reviewer best serves his duty if he is objective and tries to understand the purpose of the author. I recommend Glaser's book for its many good parts.

VENOSTOMY

To the Editor:—I wish to comment on the article "Venostomy, an Improved 'Cut-Down' Procedure in Infants and Children," by Miles and Harris (*J. A. M. A.* 161:619 [June 16] 1956). Most aspects of the technique described and illustrated are excellent; however, there is one dangerous omission. The illustration accompanying the article shows the polyethylene tubing extending straight out of the cut-down to the needle. This is extremely dangerous, since any weakening of the catheter wall by repeated insertion of the needle or flexion of the tubing against the needle, or an error in handling replacement of the needle, may result in the polyethylene tube being carried away into the blood stream. I personally know of five such instances. In one of these, a nurse was changing the needle inserted in the cannula and let go of the polyethylene tube just for an instant, only to see the tube disappear beneath the skin. It was later found in the heart. I would highly recommend that a loop of the polyethylene tube be fashioned between the venostomy and the needle and that this loop be securely fastened to the skin by adhesive tape.

MICROSPORUM GYPSEUM

To the Editor:—In the Aug. 25 issue of THE JOURNAL on page 1687, the following statement was made under the heading "Correction": "What was meant was that all ringworms that attack man or animals attack both, except M. audouini, which attacks only man, and M. Gypseum, which attacks only animals." The latter part of the sentence should be deleted, as M. gypseum does attack man.

LAW DEPARTMENT

MEDICOLEGAL ABSTRACTS

Revocation of a License for Conviction of an Offense Involving Moral Turpitude.—The Board of Medical Examiners revoked the plaintiff's license to practice medicine and surgery in California. The order of revocation was affirmed by the superior court, so the physician petitioner appealed to the Supreme Court of California.

In October, 1953, a judgment of conviction was entered on petitioner's plea of guilty to a violation of the Alcoholic Beverage Control Act. Subsequently a special investigator for the Board of Medical Examiners filed with the board an accusation against petitioner, charging that his conviction was for an offense involving moral turpitude and that he was therefore guilty of unprofessional conduct under the Business and Professions Code. Subsequently this petition was heard before a hearing officer who found that the conviction in question was for giving a drink of an alcoholic beverage to a 17-year-old boy but that the crime did not involve moral turpitude. He recommended that the accusation be dismissed. The Board of Medical Examiners, however, decided that petitioner had been convicted of a crime involving moral turpitude and revoked his license to practice medicine and surgery in the state. Upon appeal to the superior court, that court found that "said conviction was of a crime involving moral turpitude in that it arose from the furnishing of intoxicating liquor by the petitioner to a minor . . . without just cause or explanation, and that at said time and place and in connection with the furnishing of said intoxicating liquor the petitioner did engage in immoral acts with the said minor."

Under the plain language of the Business and Professions Code, said the Supreme Court, it is the conviction alone of an offense involving moral turpitude that empowers the board to suspend or cancel a license. Since the record of conviction is conclusive evidence of the unprofessional conduct, the circumstances under which the crime was in fact committed cannot be considered. Moral turpitude must be inherent in the crime itself to warrant cancellation or suspension of a license because of the conviction. Moral turpitude is not inherent in the crime itself unless a conviction in every case would evidence bad moral character. Only if the minimum elements for a conviction necessarily involve moral turpitude, and a conviction cannot be had without proof of fact showing moral turpitude, can the conviction be held to be of an offense involving moral turpitude.

We have concluded, the court continued, that the offense of giving an alcoholic beverage to a person under the age of 21 years does not in every case evidence a bad moral character and that moral turpitude is therefore not inherent in the crime itself. Conviction alone, therefore, of such an offense does not warrant the suspension or cancellation of a license under the Business and Professions Code. If other acts committed at the same time as the offense for which a licensee is convicted constitute unprofessional conduct, the licensee may be disciplined for those acts. He must, however, be charged with such acts. In the present case petitioner was neither charged nor convicted of anything but a violation of the Alcoholic Beverage Control Act.

An offense that does not necessarily involve moral turpitude may be committed during the commission of an act involving moral turpitude, e. g., the Alcoholic Beverage Control Act may be violated by adulterating a nonalcoholic drink with alcohol and inducing a minor to take it in the belief that it is nonalcoholic. In such cases a licensee cannot be disciplined under a procedure that makes the record of conviction conclusive evidence of unprofessional conduct but must be charged with the fraudulent or immoral act and given a hearing on that charge. The petitioner was not charged with such an act, and there is nothing in the record to indicate any deception or other immoral act in the giving of the alcoholic beverage.

Accordingly the judgment of the trial court was reversed and the order of revocation directed to be set aside. *Lorenz v. Board of Medical Examiners, 298 P. (2d) 537 (Calif., 1956).*

Hospitals: Liability of Husband for Hospital Fees of Estranged Wife.—This was a suit for the recovery of fees for hospital services rendered to the estranged wife of the defendant. From a judgment for the plaintiff, the defendant appealed to the Court of Appeals of Maryland.

The patient-wife entered the plaintiff's hospital in 1952 and was still in the hospital in a critical condition at the time of the suit. The affidavit of the secretary of the hospital alleged that there was a balance due for hospital services of over $7,000, that the defendant had promised to pay the amount, and that the care and treatment rendered to the patient was a necessity for which her husband was justly liable. The defendant admitted that he was married to the patient, but he disputed the claim and swore that he did not owe any part of it. He then alleged by way of defense (1) that his wife, at the time of her separation from him without just cause, had a separate estate; (2) that they had been separated for about 30 years, (3) that he had never promised to make any payment to the plaintiff of any kind; and (4) that the hospital services were not necessary after January, 1953.

Generally, said the court, a husband is liable for the necessaries provided for the support of his wife. Whatever may be a husband's circumstances, his wife is entitled to food and clothing to preserve her life and health, and to medical attendance and nursing when she is sick. The Maryland statutes, which preserve to the wife the ownership and enjoyment of her property, do not relieve the husband of his common-law obligation to maintain his wife and to pay for medical attendance upon her. Generally, therefore, it is the husband's duty to support his wife when she is confined in a hospital, and it is only when he is unable to do so that resort can be had for her maintenance to her separate estate. However, continued the court, the rule is different where the wife deserts her husband without just cause and continues to live apart from him without his consent.

In accordance with the doctrine generally accepted in this country, the Court of Appeals concluded, it is held in Maryland that a wife has the right to look to her husband for support if he deserted her or if his misconduct forced her to leave him. But, when a wife deserts her husband without his fault, she forfeits all right to support from him and carries with her no authority to pledge his credit even for necessaries.

In the case at bar, the question whether the husband was liable for the wife's hospital care and treatment was squarely in issue. It is clear that the husband's pleas and affidavit raised the dispute of material fact as to whether his wife deserted him without just cause, thereby relieving him of liability for necessaries furnished to her. The plaintiff contended that the husband's pleas and affidavit were inadequate because they did not state precisely that the patient was guilty of desertion. We do not consider this a substantial objection. It is true that he did not use the word "desertion." However, his allegations that his wife had left him without just cause for the separation, that they had been separated for 30 years, and that many times he had attempted to effect a reconciliation but each time she refused to return to live with him were tantamount to an allegation that she had deserted him.

Accordingly the judgment of the trial court in favor of the plaintiff hospital was reversed and the cause remanded for further proceedings. *Kerner v. Eastern Dispensary and Casualty Hospital, 123 A. (2d) 333 (Md., 1956).*

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

Rubella in a Remote Community. F. K. M. Hillenbrand. Lancet 2:64-66 (July 14) 1956 [London, England].

Hillenbrand describes an outbreak of rubella that occurred at Port Stanley, the chief settlement in the Falkland Islands, in 1952-1953. The outbreak began 17 days after the arrival of the monthly mail and passenger boat from Montevideo on Sept. 7, 1952. None of the passengers reported sick, and the first case was seen in a Port Stanley schoolboy. Most of them occurred during the first two months; but a second crop followed Christmas gatherings, and after this there were still a few scattered cases. No other infectious fever was current at the time. Previous outbreaks of rubella had occurred on the islands in 1911-1912 and in 1947-1948. When some patients stated that they had had rubella in 1947-1948 the author was at first inclined to think that they had confused german measles with true measles, of which there had been an outbreak at about the same time. Of 33 women who became pregnant during the epidemic of 1952-1953, 15 claimed to have had rubella earlier. However, there were 107 school children whose medical records showed that they had both measles and rubella in 1947-1948, but clinical rubella developed in 15 and subclinical rubella in 6 of these during the 1952-1953 outbreak.

Rubella attacked persons over a wide range of age, and in the age group 15 to 45 many more females than males were affected. Other outstanding features were relapses, second attacks, many subclinical infections, and an unusually high incidence of a variety of rheumatic afflictions. Enlargement of the lymph nodes, especially of the postauricular and occipital ones, was found to persist for many months. Pregnancies starting during the epidemic resulted in a number of congenital defects and other sequels similar to those reported elsewhere. The author emphasizes the advantages of studying infectious diseases in isolated communities, pointing out that the isolation makes it easier to estimate incubation periods, epidemic periodicity, and immunity; and, as other infections are less likely to be present, the clinical picture may be observed in pure form.

Clinical and Biological Observations on the Association of ACTH and Antibiotics in the Treatment of Pulmonary Tuberculosis. E. Minetto, V. Donadio, G. M. Molinatti and A. Pizzini. Minerva med. 47:1744-1758 (June 6) 1956 (In Italian) [Turin, Italy].

Patients with various forms of pulmonary tuberculosis who were receiving treatment with antibiotics were given ACTH and cortisone. They were kept under clinical and biological control. ACTH was given in infusions in a 500 cc. solution with 5% of glucose, 30 drops per minute, continued for five hours. Infusions were given 12 hours apart. The dose of ACTH varied from 10 to 5 units per day. Particular attention was paid to the temperature, weight, and diuretic curves. Erythrosedimentation and glycemia were controlled every four days. Radiological examination of the thorax and search for alcohol-acid-resistant bacilli were performed periodically. The results showed that the treatment is indicated in forms of tuberculosis with a marked exudative and allergic progress. ACTH can improve the diminished clinical sensitivity to antibiotics. ACTH and cortisone, considered as stimulant or substitution therapy, are also indicated in forms of pulmonary tuberculosis associated with adrenal hypofunction.

Erythema Nodosum as a Manifestation of Sarcoidosis. D. G. James, A. D. Thomson and A. Willcox. Lancet 2:218-221 (Aug. 4) 1956 [London, England].

The authors report on 27 patients in whom histological evidence of sarcoid tissue was obtained at the time of erythema nodosum. Seven were men and 20 were women, aged 18-60, the majority being young adults. Evidence of sarcoidosis was obtained by biopsy of a lymph node in 4 patients, of the skin in 5 patients, of the liver in 4, through Kveim test in 19, and directly from a skin lesion of erythema nodosum in 2. The lesions always occurred in the legs, but were also present in the arms in four patients. Lesions were present for from one to six weeks (average, two weeks). Two patients had recurrences after a two-month interval. Constitutional disturbances and fever (temperature 102 F) were present for the first few days. Seventeen patients (63%) had an associated polyarthritis. Polyarthritis preceded erythema nodosum in 11 patients.

Radiography of the chest showed bilateral enlargement of the hilar lymph nodes in 24 of the 27 patients; in 3 only single films were taken, so changes were possibly missed. Enlargement persisted for from 2 to 12 months. The erythrocyte sedimentation rate was often greatly increased but returned to normal as the erythema nodosum subsided. Fifteen patients followed up for more than two years have remained well and free from clinical and radiographic complications. Twelve patients followed up for from 9 to 12 months remain in good health. It is important to obtain histological evidence to separate erythema nodosum due to sarcoidosis from erythema nodosum due to other causes.

Environmental Causes of Cancer of the Lung Other Than Tobacco Smoke. W. C. Hueper. Dis. Chest 30:141-159 (Aug.) 1956 [Chicago].

The author studied the environmental causes of cancer of the respiratory system. The evidence presented definitely establishes the fact that some well-defined exogenous physical and chemical agents are causally involved in the production of occupational cancers of the respiratory system of members of certain restricted worker groups. Since epidemiological studies of various large worker groups and of the membership of special occupations have shown marked differences in their lung cancer death rates, and since excessive lung cancer death rates have been found in occupational groups with occupational exposure to known industrial respiratory carcinogens, it is likely that industry-related factors account for a much larger number of lung cancers than that on record. The demonstration of recognized environmental respiratory carcinogens in the atmosphere especially of urban areas and of consistently and markedly higher lung cancer death rates for urban populations over rural populations strongly suggests that industry-related air pollutants may play a causal role in the causation of lung cancer and its recent considerable increase in frequency in practically all industrialized countries.

Occupational and industry-related carcinogenic air pollutants seem to play an important role in the causation of lung cancer and its recent increase in frequency, but it is obvious that they are not the only factors responsible for pulmonary carcinogenesis. Research on the etiology of lung cancer therefore should be conducted on a broad basis, including not only inhalants but also agents entering the body through nonrespiratory routes.

Salicylate Ingestion: A Frequent Cause of Gastric Hemorrhage. J. J. Kelly Jr. Am. J. M. Sc. 232:119-128 (Aug.) 1956 [Philadelphia].

The occurrence of weakness and tarry stools is reported in a 62-year-old woman and in two men, aged 29 and 53 years respectively, who did not notice any digestive disturbance or abdominal pain. Free acid was found in the fasting stomach, and there was no roentgenographic proof of an ulcer. The melena always followed episodes of headache, which in turn were treated with acetylsalicylic acid (aspirin). Hypoprothrombinemia was not the cause of the bleeding, as the prothrombin time was

Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

normal in all the patients in whom it was determined and the amount of salicylates taken was inadequate to depress significantly the prothrombin concentration of the blood. An examination of the hospital records of 49 patients with unexplained upper gastrointestinal bleeding revealed that 16 (32%) of these patients had received salicylate therapy for such conditions as severe headache, arthritis, grippe, and chest injury when the bleeding occurred. The ingestion of aspirin given for headache or arthritis preceded the symptoms of myocardial infarction in only 4 (4%) of 100 patients with acute myocardial infarction and without gastrointestinal bleeding who served as controls. The striking difference between the 32% incidence of salicylate ingestion in the group with the unexplained gastrointestinal bleeding and the 4% incidence in the control group is strong circumstantial evidence of a cause-and-effect relationship between the salicylates and the gastrointestinal bleeding.

Of 75 patients with a bleeding peptic ulcer, 15 (20%) were receiving salicylates for headache, arthritis, or grippe when the symptoms developed. This high incidence of aspirin users among patients with bleeding peptic ulcer is not proof that salicylates were responsible for the bleeding, but the use of salicylates appears to increase the frequency of bleeding in patients with proved peptic ulcer. The mechanism of bleeding both in the patients with proved peptic ulcer and in the other group, which was without symptoms or laboratory evidence of peptic ulcer, is not clear. A local mucosal factor may be the cause, but it seems more likely that aspirin by augmenting the gastric acidity leads to peptic erosion and bleeding. The hypothesis is advanced that the seasonal incidence of peptic ulcer activation may be partially explained by the more frequent use of this drug in the "ulcer months." All patients with upper gastrointestinal hemorrhage should be questioned concerning the use of salicylates or proprietary preparations containing salicylates. This may be a lifesaving measure.

Pro-Banthine in the Treatment of Peptic Ulcer: A Clinical Evaluation with Gastric Secretory, Motility and Gastroscopic Studies: Report of 60 Cases. J. Lichstein, M. G. Morehouse and K. L. Osmon. Am. J. M. Sc. 232:156-171 (Aug.) 1956 [Philadelphia].

Propantheline (Pro-Banthine) bromide was given over a 24-month period to 60 patients with an active or chronic recurrent duodenal ulcer who were placed simultaneously on a graduated ulcer diet and were also given some form of antacid therapy. Mild sedation was added when indicated. Doses of 60 mg. or more of propantheline four times a day were employed. Twenty patients who had received methantheline (Banthine) bromide previously served as their own controls.

Forty-six of the 60 patients were brought under control symptomatically within from 24 to 72 hours. The relief of pain was often immediate, and its duration was maintained for from three weeks to three months. Seven patients did not obtain relief, a severe intolerance to the drug developed in one, and in four patients the follow-up was unsatisfactory. Undesirable side-effects of propantheline were almost exclusively confined to dryness of the throat. Headache, constipation, and difficulty in urination were observed in only a few patients, and increased frequency in one. Three patients had transitory muscular weakness of the upper and lower extremities; but these symptoms did not require withdrawal of the drug. Wide drug tolerance was shown by the ability of the patients to take the drug steadily for many months without any untoward effects and by their ability to tolerate sudden large increases. Propantheline produced significantly fewer side-effects than methantheline in the same patients with ulcer; propantheline proved as effective as methantheline in the relief of pain; and the flexibility of dosage was greater with propantheline than with methantheline. The effect of propantheline on gastric secretion was studied in 21 patients. The drug invariably depressed the volume of secretion; the degree of acidity as measured by pH, clinical units and milligrams of hydrochloric acid was sporadically and not consistently affected. Intramuscular administration of the drug consistently inhibited gastric motility as measured by the balloon-water manometer kymograph and the strain gauge oscillograph methods. Intragastric administration of propantheline was followed by a similar but slower and less dramatic effect on motility. The results of gastroscopic examination in 3 of 13 patients indicated an effect on gastric tone similar to that observed after vagotomy. Long-term observations in the patients treated with propantheline did not suggest any reduction in recurrence rate or decrease in incidence of complications or a lessened need for surgical intervention.

The clinical effects of propantheline were also studied in 16 patients with functional dyspepsia, irritable colon, regional ileitis, chronic ulcerative colitis, peptic esophagitis, and chronic recurrent pancreatitis. The parasympathetic inhibitory effect of propantheline on gastric motility appeared to be clinically manifest only in the acute phase of the disorders in these patients. This has been most strikingly shown by the short-term effectiveness of the drug in controlling the diarrhea that periodically occurs during acute exacerbations in patients with the "unstable colon" syndrome.

Hepatic Coma. M. Bjørneboe. Nord. med. 55:894-895 (June 28) 1956 (In Danish) [Stockholm, Sweden].

The cause of liver insufficiency is most often virus hepatitis or cirrhosis of the liver, but toxic liver lesions, eclampsia, and different forms of occlusion jaundice can also lead to liver insufficiency. Clinically it is usually marked by intense itching and certain neurological symptoms, included here under the not wholly adequate term hepatic coma. The neurological phenomena consist of mental changes, of which the first symptoms are changes in personality, loss of memory, confusion, and hallucinations, and of abnormal motor activities, revealed in part by involuntary movements of a special type called flapping. Periods with flapping alternate with periods without flapping. These involuntary jerking movements are thought to be almost pathognomic for liver insufficiency. At a later stage flapping disappears, the extremities become flaccid, and extensive plantar reflexes are demonstrable. The histological picture is marked by extensive plasmocytotic astrocytosis with relatively sparse occurrence of ganglion cell lesions. Care must be exercised in treating patients who have grave liver insufficiency, liver cirrhosis and strongly developed collateral circulation, or portacaval anastomosis with a diet rich in protein or with resins containing ammonium or ammonium chloride. If in such patients symptoms of threatening hepatic coma set in, the food intake should be limited to glucose and the intestinal canal should be emptied by enemas. The administration of tetracycline derivatives can perhaps also reduce the ammonia formation in the intestine. Patients who have shown a tendency to recurring hepatic coma should receive a diet containing about 40 gm. of protein daily. Pathophysiological studies point to increased ammonia content in the blood as an essential factor in the origin of this form of coma.

The Nephropathy of Potassium Depletion: A Clinical and Pathological Entity. A. S. Relman and W. B. Schwartz. New England J. Med. 255:195-203 (Aug. 2) 1956 [Boston].

The occurrence of a previously unrecognized disorder of renal function associated with potassium deficiency is described in two men and three women with severe chronic potassium depletion that had resulted from chronic diarrhea. Severe hypokalemia was the rule, but no patient was dehydrated or sodium depleted, and none had significant acid-base disturbances. There was no evidence of renal wasting of potassium. One patient had pronounced polyuria. Blood nonprotein nitrogen levels were normal or only slightly elevated, but all patients had vasopressin-resistant hyposthenuria. Clearances of inulin, endogenous creatinine, and para-aminohippuric acid were significantly reduced. Routine urinalysis revealed minimal inconstant albuminuria and cylindruria in three patients. Replacement of potassium deficits by daily intravenous administration of potassium chloride resulted in gradual restoration of the significantly impaired renal function to normal in four patients. In the fifth patient renal function was only partially restored, but this was probably related to the complicating factor of chronic pyelonephritis, as well as to the fact that complete restoration of potassium balance could not be achieved in the course of the observation period.

Renal biopsies obtained in three of the five patients revealed hydropic and degenerative changes confined chiefly to the convoluted tubules, without significant glomerular or vascular lesions. In one patient, striking vacuolation of the tubules was observed. A second renal biopsy was carried out in two patients one year later; it revealed that restoration of the potassium balance had produced total healing of the lesion in one patient and marked improvement in the other. Observations in the five patients and in eight patients whose cases were collected from the literature suggested that the nephropathy of potassium depletion is a relatively common clinical and pathological entity that may occur as a complication in a wide variety of circumstances. Potassium depletion apparently should be added to the list of causes of reversible renal disease.

SURGERY

Development of Cancer Twice in One Stomach. K. Nicolaysen and K. Liavaag. Nord. med. 55:911-913 (June 28) 1956 (In Norwegian) [Stockholm, Sweden].

Three cases are presented in which cancer developed in the gastric stump 15, 25, and 39 years respectively after resection of the stomach for cancer of the stomach. The question is whether the condition should be considered as a recurrence of the original cancer or whether there is really a new cancer. Because of the long interval and the fact that the patients were free from symptoms of digestive disorders during the interval, the authors are inclined to regard the cases as representing a new development of cancer in the gastric stump and to consider this development in the same light as cancer developing in the resected stomach of ulcer patients with the same interval between the primary operation and the later cancer development. The patients are not to be regarded as unfit for surgical treatment, since total gastrectomy is possible as shown by the first two cases reported.

Intravenous Injections of Tetracycline in Severe Surgical Infections. L. Pattarin and V. Blini. Minerva chir. 11:509-513 (June 15) 1956 (In Italian) [Turin, Italy].

The authors studied the effect of tetracycline in 43 patients with various surgical infections. Very slow drip venous injection was employed; it never exceeded more than 20 drops a minute. Intramuscular injections or oral administration were used only in patients who needed long-continued therapy and in those whose veins did not permit the use of prolonged intravenous injection. Infections were severe in all patients. In many patients tetracycline replaced other routine antibiotics (penicillin, terramycin) that had had no effect. The best results were obtained in infections of the biliary tract. Gram-positive and gram-negative germs were present in all of the infections. The patients tolerated the drug very well. In no case was it necessary to suspend the therapy because of the occurrence of toxic phenomena.

Prophylactic Treatment of Cancer: The Use of Chemotherapeutic Agents to Prevent Tumor Metastasis. E. P. Cruz, G. O. McDonald and W. H. Cole. Surgery 40:291-296 (Aug.) 1956 [St. Louis].

The observation that, at operation, cancer cells may be disseminated as venous emboli, by implantation in suture lines, and by spread of loose cells throughout the wound as the tumor is manipulated or removed, prompted the following experiments in animals. A suspension of Walker carcinosarcoma cells was injected into the portal vein of a rat. It was noted that nitrogen mustard given by either of three routes ([1] into the portal vein, [2] into a systemic vein, or [3] intraperitoneally) on the day of the injection of the cancer cells sharply decreased the percentage of "takes." Although the results of these experiments were only preliminary, the institution of prophylactic chemotherapy in human beings with cancer was considered justifiable.

On the assumption that "floating" cancer cells are more readily killed than cells with a vascular "root," a course of nitrogen mustard, beginning on the day of operation, has been given to 20 patients with tumors of the breast, colon, rectum, and stomach that metastasize by vein as well as by lymphatics. With the exception of poor-risk patients, the first dose was given on the day of operation and three additional doses on the next three postoperative days. Patients undergoing celiotomies were given the first dose intraperitoneally, and the remaining three by systemic vein. The conventional dose of 0.1 mg. per kilogram of body weight was used, except that the daily dose was limited to 6.5 mg., and that patients over 69 or 70 years of age were not given the full course, but one or two doses.

The animal experiments were continued in an attempt to determine the relative effect when the nitrogen mustard therapy is started at varying intervals after injection of the cancer cells, and different chemicals were also utilized. Since so many chemicals with an anticancer effect are now available, the authors believe screening tests with tissue culture methods would be desirable to obtain the most effective drug for a given tumor, as removed from the patient. Such screening tests with human cells are now in progress.

NEUROLOGY & PSYCHIATRY

Isoniazid in Disseminated Sclerosis. J. L. Adams. New Zealand M. J. 55:232-235 (June) 1956 [Wellington, New Zealand].

A report that isoniazid had been used beneficially in a hospital in the Bronx, N. Y., in cases of multiple sclerosis, and a request for this treatment on the part of one of his own patients, induced Adams to try isoniazid in five patients with disseminated sclerosis. The patients were asked to accept a harmless therapeutic experiment with an open mind. The results of this small trial with isoniazid, while not so encouraging as those reported by Kurtzke and Berlin of the Bronx, indicate a small beneficial effect that is apparently nonspecific and empirical. Isoniazid appears to influence only recent features of deterioration. It seems to have a place in reestablishing ambulation when this is failing and in controlling fecal or urinary incontinence in some cases. The elevation in mood and the euphoria may be beneficial. There appear to be no significant ill effects. The continued use of the drug in a dosage of from 200 to 300 mg. a day appears warranted in selected patients with disseminated sclerosis. The therapeutic resources in this disease are so inadequate that even a drug offering a slight beneficial effect is welcome.

The Treatment of Bulbar Poliomyelitis. M. H. Seifert. Postgrad. Med. 20:168-176 (Aug.) 1956 [Minneapolis].

The author lists 10 commandments to be observed in the treatment of patients with bulbar poliomyelitis: 1. Do not give opiates or sedatives. Restlessness equals anoxia. 2. Do not allow food by mouth if there is vomiting or difficulty in swallowing. 3. Keep patients prone or in postural drainage position with the head down, and provide constant nasal suction if there is any accumulation of secretions in the pharynx. 4. If these measures do not immediately clear the pharynx and keep it clear, do a tracheostomy. 5. Do not save tracheostomy for use as a last-ditch procedure. You may win occasionally, but not often. 6. Never put a bulbar poliomyelitis patient in a respirator without a tracheostomy. 7. Any supportive measure to keep a patient with bulbar poliomyelitis alive through the acute stage is worthwhile. The author observed one patient who was just vegetating for more than two weeks, with circulation supported by Levophed; she now rides a bicycle and plays like any other child. 8. Remember that in an emergency your anesthesiologist may help by intubating the larynx, but then do the tracheostomy as soon as possible. 9. Constant watchfulness and attention to detail are necessary, and nursing care is of paramount importance. The house staff should be available at all times to meet emergencies, and a nurse must be near the patient constantly. 10. Pediatrician or internist, neurologist, anesthesiologist, laryngologist, orthopedist, physiotherapist, house staff, and nursing staff must all constitute a team in the care of these patients, and the reward is great.

DERMATOLOGY

Tinea Capitis Due to Trichophyton Sulphureum. J. M. Beare. Brit. J. Dermat. 68:193-199 (June) 1956 [London].

Beare cites a number of reports that indicate that Microsporum audouini is becoming less common as a cause of tinea capitis but that Trichophyton sulfureum infections are becoming more frequent. In a previous study, the author and an associate had isolated T. sulfureum 21 times in 1,004 patients with tinea capitis. The present report is concerned with 82 children who had ringworm of the scalp due to T. sulfureum. These 82 include the 21 noted above and were seen during the period from January, 1949, to December, 1955. They represent all the children in whom T. sulfureum was cultured from ringworm lesions of the head at the Royal Belfast Hospital for Sick Children. Most of the children came from large centers of population. There were 45 boys and 37 girls. While T. sulfureum is not expected to produce a severe inflammatory reaction, 23 of the 82 children did exhibit such a reaction and in 10 of these 23 it was especially severe. Of the remaining 59 children, 44 had no reaction and 15 had a mild folliculitis.

Infections showing a relatively noninflammatory type of reaction were difficult to diagnose. Often the patches were tiny, and only an occasional broken-off hair led one to suspect ringworm at all. Sometimes a differentiation on purely clinical grounds between this infection and mild patchy seborrheic dermatitis was impossible. The regular breaking-off of hairs at approximately one-eighth of an inch above the surface, found, classically, in microsporum infections, is not always seen with T. sulfureum. The skin within this patch may be normal or may show various degrees of inflammatory change. Usually, however, scaling is present. There is no fluorescence in Wood's light, though affected hairs will often appear dull and can be distinguished from normal hair. It seems likely, therefore, that a large number of mild scalp infections due to T. sulfureum are not recognized. In 3 of the 10 patients with severe inflammatory reactions kerion developed after from 8 to 11 weeks. While the delayed kerionic reaction may prove disconcerting, it usually hastens cure. The author feels that x-ray epilation is indicated in children who have extensive noninflammatory lesions. Watchful expectancy with anticipation of spontaneous cure probably within a year seems to be the most logical management for insignificant and noninflammatory patches.

reatment of Fungoid Dermatoses and Some Nonmonilial rmatoses by Mycostatin. C. Grupper. Semaine hôp. Paris. 2253-2263 (June 30) (In French) [Paris, France].

Fungoid dermatoses or cutaneous moniliases were formerly regarded as occurring only in patients with severe organic deficiencies such as diabetes or leukemia. No specific treatment was known before 1953. The term cutaneous moniliasis should be abandoned in favor of candidiasis, because the most highly individualized forms are caused by the vegetation in situ of Candida albicans. Interest in these conditions has increased since the era of fungoid antibiotics. The discovery of nystatin (Mycostatin) and its effectiveness in the treatment of skin diseases focused attention on the therapy of these conditions in general medicine and especially in pediatrics and in dermatology. The therapeutic effect of Mycostatin has been studied in many of the monilial dermatoses. It is at present the treatment of choice in cutaneomucous and ungueal moniliasis, whether local or generalized, profound or superficial, and it is specific for these conditions when it can be introduced into the center of the mycotic foci. It is well tolerated and completely harmless. It has also been tried in other nonmonilial dermatoses with variable results, sometimes excellent and sometimes good, but never harmful. Sixty patients with cutaneous moniliasis and 93 with various nonmonilial dermatoses were treated with Mycostatin applied locally or given by mouth. Local treatment with Mycostatin was sufficient in 25 patients with buccal, perianal, and perigenital moniliasis and intertrigo. In 31 cases of ungueal moniliasis Mycostatin seemed to be specific. In superficial generalized cutaneomucous moniliasis, local treatment should be reinforced by administration of Mycostatin by mouth. In generalized profound granulomatous moniliasis, local and general treatment with Mycostatin should be supplemented by corticotherapy. In nonmonilial dermatoses, whether Mycostatin is used as a general treatment modifying the intestinal flora or as a local treatment modifying the surface flora, the results are irregular and nonspecific, but certain dermatoses have responded favorably. The addition of hydrocortisone to locally applied Mycostatin seems to reinforce the action of the antifungal drug.

Alopecia Areata. J. C. Seelen, L. A. M. Stolte, J. H. J. Baakker and E. Verboom. Nederl. tijdschr. geneesk. 100:1790-1799 (June 23) 1956 (In Dutch) [Haarlem, Netherlands].

The authors investigated the endocrinologic functions of 12 women with alopecia areata. Their ages ranged from 15 to 47 years, all except two being less than 40 years of age. While the possibility that endocrine disturbances might play a part in alopecia areata had been suggested earlier, no systematic studies on the endocrinologic functions of such patients had been reported. The only unusual endocrinologic finding was that the excretion of 17-ketosteroids was low in four patients and at a low level in the other eight. The intravenous administration of corticotropin (ACTH) in one patient with low excretion of 17-ketosteroids did not effect an increase. In view of the fact that hair growth and alopecia areata had improved in some of the patients during pregnancies, the authors resorted to the administration of progesterone. They found that the intramuscular injection of progesterone crystals induced hair growth in three women with alopecia.

UROLOGY

Osteitis Pubis—Sudeck's Atrophy? Griessmann and F. Dammann. Ztschr. Urol. 49:321-329 (No 6) 1956 (In German) [Leipzig, Germany].

The authors show that osteitis pubis, which has become a rather frequent complication of suprapubic operations, is really an osteoporosis of traumatic origin (Sudeck's atrophy) of the rami of the os pubis. Osteitis pubis and Sudeck's atrophy after fracture are secondary forms of osteoporosis. They correspond in causation, pathogenesis, clinical course, and roentgenologic aspects. Therapeutic efforts likewise show a close relation between the two lesions. It is known that antibiotics and various chemotherapeutic agents fail to influence either of these lesions, but it has been suggested that measures inducing hyperemia might be helpful The authors point out that several other observers have suggested the possibility that osteitis pubis might be a form of traumatic osteoporosis (Sudeck's atrophy) of the rami of the os pubis

Stilbestroldiphosphate in Therapy of Carcinoma of the Prostate. H. Druckrey and K Kaiser. Deutsche med. Wchnschr. 81:1084-1086 (July 6) 1956 (In German) [Stuttgart, Germany].

The experimental demonstration that estrogens inhibit cell division suggested that their therapeutic effect in cancer of the prostate is not due to an indirect hormonal mechanism, as was formerly assumed, but is due to a direct action on the cell. In view of this fact, and because of the strong phosphatase activity of the prostatic tissues, stilbestroldiphosphate was introduced into the therapy of prostatic cancer, after it had been found that this phosphate is readily split by the phosphatase in the prostate. Investigations had demonstrated also that stilbestroldiphosphate has no cytotoxic effect. It is readily soluble in water and consequently can be given intravenously in large doses Splitting by the phosphatase then liberates the active estrogen particularly in the tissue of the prostatic cancer, and, because of its low solubility, it actually becomes concentrated there. The unsplit but water-soluble diphosphate, however, is readily eliminated, so that the other parts of the body are hardly influenced Pharmacological studies revealed that the substance is of low toxicity, whereas stilbestrol, as a phenol, is rather toxic. Phosphorylization has a detoxifying effect.

It is advantageous to administer a pharmacological substance not in an active form but rather in an inactive "transport" form, from which the body, particularly the cells to be acted on, produce the "active" form. On the basis of the structural formula, the authors show that this is the case in stilbestroldiphosphate. The authors comment on the calcium-precipitating effect of soluble phosphates to show that bleeding in patients with cancer of the prostate is due to the products of decomposition of the tumor rather than to the phosphates. They demonstrated by experiments in vitro and on animals that in therapeutic doses stilbestroldiphosphate does not impair the blood coagulation, nor did they observe clinical evidence of changes in the blood coagulation time. They conclude that the introduction of stilbestroldiphosphate signifies a decided advance in the therapy of prostatic cancer.

INDUSTRIAL MEDICINE

Mechanism of Uranium Poisoning. H. C. Hodge. A. M. A. Arch. Indust. Health 14:43-47 (July) 1956 [Chicago].

Quite apart from its radioactivity, uranium is one of the most toxic elements chemically, more toxic than arsenic or mercury. Providentially, uranium is absorbed into the body only with difficulty. If it were not so, certain workmen in the early days of the Manhattan Project would have been injured severely. Uranium in the body tends to be converted into the hexavalent uranyl ion; this is the stable valence form. In this discussion, when biological effects are being considered "uranium" usually means "uranyl ion." The uranyl ion in the blood stream is carried in part complexed with protein and in part with bicarbonate; almost none exists as uranyl ion. The uranium protein complex is nondiffusible; the uranium bicarbonate complex is diffusible. Approximately 40% of the uranium is protein bound, and 60% is bicarbonate bound. In the bone, uranium is deposited principally on the surface of the mineral crystals by exchange with calcium.

The kidney is the sole site of the characteristic histological injury. There is a lag period ranging from hours to days (depending inversely on the dose) after the administration of the uranium before the damage becomes evident either histologically in the kidney tissues or functionally in elevated blood nonprotein nitrogen, diuresis, or oliguria. From the glomerular capillary, diffusible uranium bicarbonate enters the glomerular urine. Passing through the proximal convoluted tubule, bicarbonate is reabsorbed into the venous blood, freeing uranyl ion in the tubular urine. The uranyl ion reacts with the protein membranes of the columnar cells, producing injury and—if the dose is sufficient—death of these cells. The cells rupture, and the cell contents are discharged into the urine. The most delicate indices of uranium poisoning are the concentrations of urinary proteins; the concentration of urinary amino acids (especially the amino acid nitrogen-creatinine ratio), and the catalase activity. From studies of kidney function and renal clearances, combined with histological and autoradiographic studies, the site of major uranium injury has been localized in the distal third of the proximal convoluted tubule. If the injury has not been too severe and cells of the tubule lining remain, repair and regeneration follow, and a few weeks or a month after the administration of uranium an animal may be almost completely normal by every test.

From studies of large numbers of animals exposed to a variety of soluble uranium compounds for periods of from one to two years, it has been conclusively demonstrated that there is no kidney injury when animals breathe an atmosphere containing 50 γ of uranium per cubic meter of air. This value has been set as the maximal allowable concentration. If exposures are exclusively to insoluble uranium compounds, somewhat higher dust concentrations can be inhaled without evidence of kidney injury. For insoluble compounds, "it is evident that exposures to concentrations of 50 γ or 100 γ per cubic meter would lie within the negative zone with wide margins of safety."

Bilateral Pleural Calcifications as the Result of Occupational Exposure to Dusts. W. Fehre. Fortschr. Geb. Röntgenstrahlen. 85:16-25 (July) 1956 (In German) [Stuttgart, Germany].

On investigating the histories of patients with bilateral pleural calcifications, the author found two patients who had been Xylolite (wood-tile) workers for a number of years in the same factory. These two patients had no history of pulmonary or pleural disorders that might have caused the calcifications. Xylolite workers come in contact with sawdust, mineral colors, silicate, talc, magnesite, and magnesium chloride solution. Formerly (until about the middle 20's), they also had to handle asbestos. In the preparation of Xylolite, the dry ingredients are mixed before they are put into the magnesium chloride solution. A considerable amount of dust is raised when the dry ingredients are mixed in closed rooms.

The author examined 30 workers of one Xylolite factory and five retired workers who had formerly worked in this plant. None of the 22 workers who had less than 20 years' exposure were found to have pleural calcifications, but of the remaining 13 patients, whose history of exposure ranged from 20 to 50 years, 7 had pleural calcifications, 4 of them bilaterally. These calcifications are ascribed to the inhalation of silica. They have been designated as talc plaques, and have been observed after exposure to micaceous and asbestos dusts. As regards their appearance in Xylolite workers, the author believes that the increased incidence in some and not in other factories suggests that a certain combination of dusts or the admixture of other constituents is essential for the development of the calcifications. The importance of the differential diagnosis of bilateral pleural calcifications is discussed.

THERAPEUTICS

Therapeutic and Toxic Effects of Enteric-Coated Aminometramide. W. A. Tatge, D. E. Winnik and G. N. Spencer. Am. J. M. Sc. 232:175-180 (Aug.) 1956 [Philadelphia].

Aminometramide (Mictine), a member of a group of 6-aminouracils found to produce a maximum of diuresis with a minimum of gastrointestinal irritation, was given to eight patients with portal cirrhosis, edema, and ascites and two patients in the nephrotic phase of glomerulonephritis who were hospitalized, and to 18 outpatients with heart disease and congestive failure. Four tablets of 200 mg. per day were given with or shortly after meals and at bedtime with milk. Patients who tolerated this dose daily for varying periods were given increasing amounts of aminometramide up to 1,400 mg. daily regardless of the diuretic effect.

Six patients with cirrhosis had significant diuresis. One of the patients with nephrotic edema sustained quite dramatic diuresis that may well have been spontaneous rather than induced. In 14 of the 18 cardiac patients edema disappeared or they maintained dry weight in the course of the study. Anorexia, constipation, nausea, or vomiting occurred in 19 of the 28 patients, and the remaining 9 patients did not have any of these symptoms. Although the incidence of gastrointestinal symptoms was high, these symptoms were minor in degree and usually followed the administration of high doses of the drug or long periods of administration. No harmful side-effects were observed in patients with chronic hepatic, renal, and cardiac disease. No particular correlation was noted between diuretic efficiency and symptoms of toxicity. With an individually tailored regimen consisting of an interrupted and broken dosage schedule of no more than therapeutic amounts, enteric-coated aminometramide may prove a safe and useful addition to the diuretic armamentarium. It may be effective where other diuretics are not. This appears to be particularly true in patients with portal cirrhosis and ascites.

PATHOLOGY

Supernumerary Chambers to the Left Heart. P. J. Barnard and A. J. Brink. Brit. Heart J. 18:309-319 (July) 1956 [London, England].

In two patients in whom death had resulted from cardiac failure, cardiac anomalies of an apparently developmental type that had not been reported previously were revealed by autopsy at the department of pathology of the University of Pretoria, South Africa. The first patient, a 5-year-old Bantu girl with shortness of breath since birth, spasmodic cough, dyspnea, cyanosis, and occasional vomiting, had an accessory left-sided two-chambered heart that was partially merged with a four-chambered heart. The radiological features suggested an outpouching in the region of the left atrial appendage, and the position of this shadow and its active pulsations related it to the cardiac chambers. Moreover, the pulsations had a paradoxical excursion showing lively expansion with each ventricular systole. This was interpreted as a mitral incompetence allowing distension of an atrial aneurysm during ventricular systole. It was difficult to explain the diastolic blowing murmur localized to the mitral area, but in retrospect this was apparently due to the diastolic emptying of the accessory sac into the left ventricle, and, had the significance of this been grasped, an accurate diagnosis of an accessory atrial sac with an unguarded orifice leading into the left ventricle might have been made.

The second patient, a 26-year-old Bantu man with orthopnea, generalized edema, and generalized cardiac enlargement, had a four-chambered heart, the left atrium of which had been vertically but incompletely divided into two compartments by an accessory septum, and in the lateral half of its circumference the mitral ring lacked attachment to the left ventricular myocardium. The left compartment of the bipartite left atrium was supported by a pyriform buttress of solid myocardium. The bipartite left atrium might be considered to have arisen from the formation of an accessory septum primum, or else the atrial anomaly together with its myocardial buttress might have represented a partially fused two-chambered left-sided heart.

RADIOLOGY

Leukemia Induction in Mice by Fast Neutron Irradiation. A. C. Upton, G. S. Melville Jr., M. Slater and others. Proc. Soc. Exper. Biol. & Med. 92:436-438 (June) [Utica, N. Y.].

Most cases of radiation-induced leukemia in human beings have resulted from exposure to gamma or x-rays; however, in Japanese atomic bomb survivors the possible importance of neutron irradiation in the production of leukemia has been cited. Male and female mice of the RF strain 8 to 16 weeks of age were exposed to x-rays or fast neutrons in the 86-in. cyclotron of the Oak Ridge National Laboratory. For a given dose of radiation the 30-day mortality was greater in neutron-exposed than in x-irradiated mice. The acute injuries produced by neutron irradiation were indistinguishable from those caused by x-rays except for acceleration of the 30-day mortality (the peak death rate occurred on the 5th day after single median-lethal neutron irradiation and on the 9th day after exposure to x-rays). After the first 30 days following irradiation, the death rate dropped nearly to control levels; 4 or 5 months later the survivors began to die of leukemia. Two major types of leukemia were induced, myeloid leukemia and thymic lymphoma. Thymic lymphoma was consistently more common in females than in males. Myeloid leukemia was more common in males than in females and was induced by relatively low doses of radiation. Thymic lymphomas were significantly more numerous in x-irradiated than in neutron-exposed mice, but the two types of radiation appeared, in general, to be of approximately equivalent over-all leukemogenic potency when compared at dose levels comparable in 30-day lethality. On fractionation of either neutron or x-irradiation, the incidence of thymic lymhoid tumors was noticeably elevated; however, the induction of myeloid leukemia was not correspondingly enhanced by fractionation.

The Influence of Histologic Type on Survival Following Radiotherapy of Bronchogenic Carcinoma. E. R. Kutz. J. Thoracic Surg. 32:165-170 (Aug.) 1956 [St. Louis].

Kutz reports experiences with radiotherapy on 50 patients with bronchogenic carcinoma. Twenty had undifferentiated carcinoma, 18 had squamous-cell carcinoma, 3 had adenocarcinoma, and 9 had malignant lesions in which the cell type was unknown. The survival time after radiation therapy was much longer in those with squamous-cell carcinoma of the lung than in those with undifferentiated carcinoma. The one-year survival rate was 0% for undifferentiated carcinoma and 53% for the squamous-cell lesions. The 18-month survival rate for squamous-cell carcinoma was 27%. Although the author did not have a control group of untreated cases, the literature has many reports of control groups according to which few patients with bronchogenic carcinoma survive one year after diagnosis without any type of therapy. The fact that a 53% one-year survival rate resulted after treatment indicates that squamous-cell lesions are benefited by radiation therapy. Therefore, radiotherapy should be carried out as vigorously as possible in squamous-cell carcinoma. The survival time in undifferentiated lesions is very poor, and it is doubtful whether radiation therapy increases it. There are three factors that account for the poor prognosis in anaplastic carcinoma: 1. The lesions metastasize early, as illustrated by the presence of metastases outside of the thorax in 45% of the patients treated. 2. They are rapidly growing and by nature extremely invasive. 3. Although they are radiosensitive, they recuperate rapidly.

ANESTHESIA

Viadril: A New Steroid Anesthetic: Preliminary Communication. L. H. Lerman. Brit. M. J. 2:129-132 (July 21) 1956 [London, England].

A new steroid anesthetic, 21-hydroxypregnane-3, 20 dione sodium succinate (Viadril) was given to 19 surgical patients. The duration of the operation varied from 8 to 90 minutes. The average dose of Viadril was 824 mg.; the range was from 500 to 1,250 mg. The addition of 19.8 cc. of an isotonic sodium chloride solution to 500 mg. of Viadril resulted in a 2.5% solution that was given intravenously, causing loss of consciousness, analgesia, absence of corneal reflex, and muscular relaxation, particularly of the larynx. Premedication was carried out with a proprietary preparation containing the total opium alkaloids in the form of soluble hydrochlorides (Omnopon) and with scopolamine, and maintenance was obtained by administration of nitrous oxide and oxygen. Some patients also received relaxants.

Viadril anesthesia resembles normal sleep. Relaxation is fairly good and bleeding usually much reduced. The patient is fully awake in about one hour after the operation, feeling well and without pain. Hormonal effects are absent and vomiting is rare. The disadvantages are the slowness of induction and the risk of thrombophlebitis in the arm in which the injection is given.

Value of "Hibernation" in Severely Shocked Patients. S. Kenny. Brit. M. J. 2:211-212 (July 28) 1956 [London, England].

Three men between the ages of 60 and 82 years with peritonitis, massive edema and inflammation of the pelvic colon, and aneurysm originating from the left common or internal iliac artery, respectively, were in severe shock when admitted to the Adelaide Hospital in Dublin, Ireland. Because there was no response to normal resuscitative measures and surgical intervention with the aid of standard methods of anesthesia carried grave risk, the patients were operated on with the aid of "hibernation." A mixture of 50 mg. of chlorpromazine hydrochloride, 50 mg. of N-dimethyl aminopropyl phenothiazine (Promethazine) hydrochloride, and 100 mg. of meperidine (Demerol) hydrochloride (Pethidine) in 14 cc. of isotonic sodium chloride solution was administered slowly. Dramatic improvement in the patients' condition occurred as a result of the sympathetic block and before the benefit of the restored fluid and electrolyte balance could be experienced. It is of the utmost importance to ensure that the replacement of fluid keeps step with the enlargement of the vascular bed resulting from the sympathetic block, and to this end the induction of hibernation must be performed slowly and with constant supervision of the blood pressure. The ease of fluid replacement in the course of the operation and in the postoperative period was a vital factor. The smooth course of anesthesia was impressive in all three patients. The postoperative course in two of these severely ill patients was practically without incident. They were restful and free from worry, requiring little nursing care and no sedative or analgesic drugs apart from small doses of chlorpromazine and meperidine. The operation of the patient with the aneurysm was technically extremely difficult. He died one hour after the operation. Death was apparently caused by a stainless-steel wire that had been inserted in the aneurysm. His condition during the operation was excellent and the value of the hibernation technique for such patients was clearly demonstrated.

BOOK REVIEWS

The Accident Syndrome: The Genesis of Accidental Injury: A Clinical Approach. By Morris S. Schulzinger, M.A., M.D. Cloth. $6.50. Pp. 234, with 45 illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 24-25 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, Canada, 1956.

The author, having studied some 35,000 consecutive accidents over a period of 18 years, is well qualified to speak on the causes, cure, and prevention of what he so aptly calls the accident syndrome. His conclusions are interesting and particularly timely, since we are faced with a rising tide of automobile injuries and deaths. First in importance in prevention is machine design, which should also be related to the human form, and second is education of those persons exposed to danger. The author's conclusion that most accidents occur to maladjusted young men with unbridled aggressiveness is certainly true, and the statement that the so-called accident-prone group is a rapidly changing one is most interesting. Much medical research is needed in order to understand the speeding, the drinking, and the reckless driver. He must be studied from the standpoint of behavior, habits, physical status, environment, and inheritance. For the student of accidents in general, and of automobile accidents in particular, the book is highly recommended.

Advances in Internal Medicine. Vol. VIII. Editors: William Dock, M.D., and I. Snapper, M.D. Cloth. $9. Pp. 366, with illustrations. Year Book Publishers, Inc., 200 E. Illinois St., Chicago 11; for Great Britain and Northern Ireland: Interscience Publishers, Inc., 88-90 Chancery Lane, London, W.C.2, England, 1956.

This book contains chapters on esophageal motor function disorders, peptic ulcer, digitalis and potassium, aldosterone, adrenalectomy and hypophysectomy in the treatment of advanced cancer, chemotherapy of tuberculosis, trace metals and chronic diseases, and hemoglobins and disease. Peptic ulcer is discussed from the viewpoint of its pathogenesis and clinical aspects. The authors stress that the medical treatment is still primarily concerned with the control of gastric acidity, although some modifications have been recently introduced. Strengthening the tissue defenses is done indirectly by maintaining the general health of the patient, by eliminating or lessening physical and emotional tensions, and by avoiding gastrointestinal irritants in food and medicaments. The patient with an ulcer can tolerate a wider variety of foods and more substantial meals than are usually prescribed. Cholinergic blocking agents, such as methantheline and its derivatives, are used because of their ability to act at the postganglionic effector site or at the ganglion between postganglionic and preganglionic fibers. Conservative gastric irradiation is a safe and useful, even though unpredictable, adjunct in the medical management of peptic ulcer. As to surgical treatment, gastric resection appears to be the operation of choice for gastric ulcers. Vagotomy alone is now rarely performed, the procedure almost always is combined with a posterior gastroenterostomy. The safety and the effectiveness of this operation for duodenal ulcer continues to be emphasized by Dragstedt and Woodward.

The chapter on aldosterone is particularly interesting. This adrenal cortical hormone is probably the most active so far discovered; it appears to be 20 to 30 times more active than desoxycorticosterone in its effect on mineral metabolism. Injections of this hormone produce retention of sodium and chloride and increased excretion of potassium. Adrenalectomy and hypophysectomy, when combined with oophorectomy, produces palliation in 40 to 50% of women with advanced breast cancer. The improvement lasts about nine months. The observations made on the effects of hypophysectomy in the treatment of advanced breast cancer require further experience before final appraisal can be made. The review of the subject of chemotherapy of tuberculosis emphasizes in particular the necessity of protracted, uninterrupted treatment after bacteriological conversion. Up to this time, 12 types of hemoglobin have been described. The subject is relatively new and provocative. The volume, as a whole, brings up-to-date the subjects treated; its value is further enhanced by an extensive bibliography.

Enzymes: Units of Biological Structure and Function. Edited by Oliver H. Gaebler, Head, Biochemistry Department, Edsel B. Ford Institute for Medical Research, Detroit. Henry Ford Hospital International Symposium. Cloth. $12. Pp. 624, with illustrations. Academic Press, Inc., 125 E. 23rd St., New York 10, 1956.

This symposium consists of 27 papers, each of which is by an outstanding authority, and the discussions that followed the presentation of the papers. The purpose of the symposium was to discuss the progress made in past studies and to point out the areas of promise for future studies in establishing the relationship of enzymes to the more complex aspects of cell physiology. The volume includes articles on the mechanisms of enzyme formation, the mechanisms regulating metabolic activity, and the transduction between the energy of enzyme reactions and other forms of energy. Part 1, dealing with the origin of enzymes, includes articles on enzyme-forming systems and the role or relationship of enzymes in induction mechanisms, cellular differentiation, and nucleic acid formation. Part 2, dealing with the status of the gene-enzyme relationship, contains articles on genetic structure and function in viruses and bacteria and on the role and interaction of genes in enzyme synthesis. Part 3, concerning enzymes and cell structure, contains several articles on electron microscopy; physiology, sedimentation, and biochemical characteristics of cytoplasmic bodies: nuclear products; reproduction; and the localization of photosynthesis in chloroplasts. Part 4, on the enzymatic basis of some physiological functions, includes articles on the part enzymes play in visual excitation, light-emitting organisms, excretory mechanisms, and muscular activity. Part 5, concerning cellular energy sources, contains articles on succinic dehydrogenase, the cytochrome system, electron transfer processes, adenosine diphosphate-respiration interaction, and hematin compounds in photosynthesis. Part 6, on regulation of enzyme activity, discusses enzymes from the standpoint of membrane permeability, muscular activity, nucleic acid metabolism, and drug action. Also included in the volume are lectures given by Linus Pauling on the future of enzyme research and by Albert Szent-Györgyi on mechanochemical coupling in muscle. The book should be of interest to almost any person who does research in or teaches biochemistry, biology, microbiology, biophysics, genetics, physiology, pharmacology, pathology, or nutrition. It contains both author and subject indexes

A Manual of Oral Surgery: a Step-by-Step Atlas of Operative Techniques. By W. Harry Archer, B.S., M.A., D.D.S., Professor of Oral Surgery and Anesthesia, School of Dentistry, University of Pittsburgh, Pittsburgh. Second edition. Cloth. $16.50. Pp. 877, with 1400 illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5, 7 Grape St., Shaftesbury Ave., London, W.C.2, England, 1956.

This textbook is made up of two essential parts. The first deals with strictly dental problems: extraction of teeth: apicoectomy, oral, face, and neck infections, cysts of the oral cavity: and complications associated with oral surgery. The chapters in this section are well written and accurately informative and should be a valuable asset to the library of any dentist. The second part contains a long dissertation on the management of facial fractures. It is written from the dental point of view and would not be acceptable to a well-trained surgeon. Too much emphasis is placed on the use of various mechanical gadgets, such as external pin fixation and traction from plaster head-cap gear or traction suspension apparatus. A good surgeon would not subject his patient to the use of these cumbersome and antiquated procedures because of their many potential complications. If a jaw fracture cannot be treated with some type of interdental wiring, a plastic or orthopedic surgeon would carry out an open reduction as a simpler, safer, and more comfortable method for his patient. Figure 1239 depicts a gadget designed to reduce a left lateral nasal fracture by means of continuous pressure from the

---

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

side. The author apparently does not realize that to reduce any fracture the fragments must first be disimpacted and then manipulated into normal anatomic position. Once this simple maneuver has been executed, maintenance of position is easy.

Two excellent short contributions by two well-known plastic surgeons are included. These chapters deal with the surgical treatment of cleft lip and palate deformities and the surgical management of complicated oral malignancies. Although these chapters are authoritative, they seem somewhat out of place in a book written by a dentist for dentists. An unusual departure is that of including a short terminal chapter describing the American Board of Oral Surgery, a dental board, not to be confused with a medical board such as is sponsored by the American Medical Association. It would seem poor taste in the medical profession for a surgical textbook to include information on the American Board of Surgery or for a medical contribution to include an account of the American Board of Internal Medicine!

Love or Perish. By Smiley Blanton, M.D. Cloth. $3.50. Pp. 217. Simon and Schuster, Inc., 630 Fifth Ave., New York 20, 1956.

The author is co-founder with the Rev. Norman Vincent Peale of the American Foundation of Religion and Psychiatry. He has undertaken to offer the lay public a reconciliatory comparison and correlation of these two fields of thought. The principal theme of the work, that is, that the human psyche stands as sorely in need of the affection and approval of other human beings as the body stands in need of nourishment, is not likely to be disputed by the exponents of either school of thought. However, the author's inclusion of all ardor, enthusiasm, interest, and constructive energy in the single term love may meet with opposition from some psychiatrists. There is much to be said for this point of view, though—especially in a book directed to the laity. The general public has been so long exposed to all the utterances of psychiatric doctrine—presented, as a rule, by those who simplify presentation by garbling or disregarding such data as have actually been established—that the average layman's conception of psychology, psychiatry, and psychotherapy is confused almost beyond belief. The monumental works of Freud and other outstanding men in the field do not make easy reading and are not likely to hold the attention of the man in the street, who, nevertheless, is as much in need of having the meaning and conduct of life clarified as is the most devoted student of the masters. The author has steered a reasonably straight course between scientific austerity and sentimentality disguised as religion. He has neither avoided nor denied the basic discoveries of science with regard to the human mind. On the other hand, he has not yielded to the currently widespread temptation to assure the public that all questions can be answered by simple faith. Nearly all aspects of human life and human relations are touched on, invariably with the straightforward common sense of a man who knows that all questions can never be answered but who knows equally well that many of man's most disturbing mental and emotional conflicts lie within man's own power to resolve. On the whole, the book is decidedly superior to most of its kind, which seldom hesitate to promise the reader riches and power overnight if he will but follow the precepts set forth. This book promises nothing, but it does explain, in a manner any reader can understand, that there are promising aspects of human life—a fact that, despite centuries of experience, seems sometimes in danger of being forgotten.

Treatment of the Child in Emotional Conflict. By Hyman S. Lippman, M.D., Director, Amherst H. Wilder Child Guidance Clinic, St. Paul. Cloth. $6. Pp. 298. Blakiston Division, McGraw-Hill Book Company, Inc., 330 West 42nd St., New York 36; 95 Farringdon St., London, E.C.4, England, 1956.

The author states on the jacket of this book that "one does not have to be a physician in order to do expert therapy in the field of emotional disturbances of children." By this he seems to mean that psychologists, caseworkers, teachers, and others can make excellent contributions to some aspects of child guidance and the problems of neuroses and delinquency. Fortunately, however, in other sections of the book he gives full weight to the somatic aspects of child behavior with which only a physician can adequately deal. He commendably calls attention early in the volume to the fact that often such factors may even outweigh parental influences and that a sick or disturbed child may so mistreat his parents that only secondarily do they become rejecting, overprotective, or otherwise deviant in their familial relationships. Most of the book is devoted to descriptions and formulations of various types of behavior problems in children. The logically minded physician may question such a concept as the need for punishment, when the author seems to mean desire for attention or guidance. Also he may be annoyed by the frequent use of doctrinaire stereotypes, such as ego, defense mechanisms, and superego instability, when the author means various normal or aberrant adaptations to stress that can be described in more specific and operational terms. Nevertheless, once this analytic jargon is translated, the therapeutic methods the author advocates, including scolding when necessary, make good clinical sense and can be applied by the physician or nonmedical associates under his direction. To these persons, the book should prove of value as a brief and fairly well organized and indexed introduction to the field.

Textbook of British Surgery. Volume One: The Abdomen. Edited by Sir Henry Souttar, C.B.E., D.M., F.R.C.S., Consulting Surgeon, London Hospital, London, England. Cloth. $24.75. Pp 547, with 238 illustrations Essential Books, Inc., 16-00 Pollitt Dr., Fair Lawn, N. J.; William Heinemann, Ltd., 99 Great Russell St., London, W.C.1, England, 1956.

This book is the first of three volumes that have been planned to cover the entire field of surgery. Such an undertaking is unique in this day of specialization. The contributors include more than 40 British surgeons, each a recognized authority in his particular sphere. The subjects they deal with include surgical anatomy; abdominal injuries; intestinal fistulas; the stomach, duodenum, liver, gallbladder, pancreas, and spleen; portal hypertension; peritoneoscopy; acute intestinal obstruction, the appendix; peritonitis; regional ileitis; diverticulosis of the small intestine; neonatal intestine obstruction; hernia; the colon, actinomycosis; and the rectum and anus. The function of the book is to correlate, for candidates for higher examinations, the surgical concepts current in Great Britain. The general surgeon, as well as the general practitioner, has been considered in the preparation of this volume. It is surprising that the bibliography is small and selective and not of recent date. The statistics quoted are primarily from the American literature, with little statistical information on the results obtained by British surgeons. Illustrations and line drawings are well placed and clear and have excellent legends. The chapter on regional ileitis is particularly illuminating, since it summarizes the British point of view on this disease. It is a delight to read a British composition, because split infinitives, dangling sentences, disjointed phrases, and misplaced adverbs are conspicuous by their absence. This is an excellent reference book that should serve a useful purpose in the libraries of active general surgeons, candidates for the American Board of Surgery, residents, and interns.

Clinical Orthopaedics. Number Seven. Anthony F. DePalma, editor-in-chief. With assistance of associate editors, board of advisory editors, and board of corresponding editors. Cloth. $7.50. Pp. 354, with illustrations J. B. Lippincott Company, 227-231 S. Sixth St., Philadelphia 5, 2083 Guy St., Montreal, Canada, Pitman Medical Publishing Co., Ltd., 39 Parker St., Kingsway, London, W.C 2, England, 1956.

This volume, similar in format to the other volumes in the series, is a convenient size, and the type makes for excellent reading. The book is well illustrated and captioned. As in previous volumes, the first part is devoted to one major subject. In this case tumors of the bone is the main subject. The first article is a biographical sketch of Dr. J. C. Bloodgood, the author is to be commended for the humanness of the presentation. After reading it, the reader should feel that he knows Dr. Bloodgood a great deal better. The articles following describe various bone tumors and ably review the subject of bone tumors in general. They are highly recommended for those who deal with such tumors and for orthopedic residents. The second portion of this book contains some interesting articles, although some of them are controversial, particularly as to their conclusions. The last section, on motorist injuries and motorist safety, should be read by everyone; it is ably done from the technical standpoint. This series of articles should be made available to the entire medical profession and especially to those who are doing traumatic surgery. For those engineers who are putting more and more speed into present motor vehicles but who have apparently neglected the necessary safety factors to go along with this speed, these articles should be required reading. The general public would also profit by reading them. This is one of the best volumes in the series.

QUERIES AND MINOR NOTES

THE "POLIOMYELITIS SEASON"

To the Editor:—*Should adults shun injections in the arm during the poliomyelitis season? A tetanus immunization program is being planned for a large industry, and the question has been raised whether the program should start during or after the poliomyelitis season. What are the criteria for determining the end of the poliomyelitis season?* *M.D., Ohio.*

Answer.—It is believed that most authorities would agree that such a voluntary program should be postponed for the same reasons, even though to a lesser degree, as prevail in similar considerations for children. A case of provocation has recently been reported by Neva in *Pediatrics* (18:59, 1956), having followed the use of diphtheria-pertussis-tetanus vaccine in early November. When one examines the poliomyelitis incidence charts of previous years, it is apparent that the curve does not begin to reach the low point until mid-November and sometimes December. One should be guided entirely by the incidence of poliomyelitis in the particular community in question. It is not the question as to whether it is the poliomyelitis season but whether poliomyelitis is prevalent in the community that should determine the answer to the question of "poliomyelitis season" in an instance such as was described.

RHEUMATIC FEVER

To the Editor:—*A boy, aged 12 years, has had repeated attacks of rheumatic fever during the past four years, with some swelling in ankles and knee joints. The family would like to know the five states in the United States according to preference that would be best for their boy.*

Samuel C. Bower, M.D., Mill Hall, Pa.

Answer.—There is no geographical region where rheumatic fever does not exist. The effect of climate on the recurrence of rheumatic fever has not been definitely established. It has been reported that there is a greater incidence of rheumatic fever in the northern states as compared with the southern sections of the country. The Mexican border and the Gulf of Mexico show a low incidence of rheumatic fever as compared with the high incidence in the Rocky Mountains and Great Lakes areas. The areas with low incidence of rheumatic fever are Southern California, Florida, Texas, Arizona, and any of the other states along the Gulf of Mexico and the Mexican border.

SPONTANEOUS CONTROL OF SOME CANCERS

To the Editor:—*A rapidly growing carcinoma of the breast can be treated by a radical mastectomy, with the patient apparently remaining well for 5 to 10 years; then a recurrence sets in, with rapid growth in distant parts of the body. What, in your opinion, would account for the long latent period without any evidence of further growth?*

M.D., New Jersey.

This inquiry was referred to two consultants, whose respective replies follow.—Ed.

Answer.—Two factors appear to operate in the spontaneous control of cancer of the breast. The first is the ability of stroma to restrain the extension of the neoplastic cells. The second appears to be related to the hormonal balance of the body—presumably the internal balance between androgenic and estrogenic effects. Some investigators believe that hormonal restraint operates through an effect on the stroma. Many examples are known of spontaneous regression of breast cancer following destructive invasion of the endocrine system by the neoplastic tissue or surgical or medical alteration of hormonal balance. These facts have led to extensive research work on the effect of oophorectomy, adrenalectomy, and hypophysectomy in the treatment of breast cancer.

Answer.—Three groups of factors govern the behavior of a given cancer in a given host; our concepts of these factors are vague at best. 1. The inherent virulency of the neoplasm: About 20% of the breast cancers will have a normal course; about 55% will have a virulent course; and the remaining 25% can be influenced by promptness of diagnosis and adequacy of treatment. 2. Response present or stimulated in the tumor: There are immunologic responses of the host to the tumor. There is a difference in the susceptibility of different tissue to malignant invasion—for example, the spleen and the heart have a lower incidence of primary and metastatic cancer than do the liver and the lungs. Endocrine changes in the body with aging, or such states as pregnancy, may stimulate tumor growth. 3. The treatment given: Removal of the mother tumor sometimes produces temporary quiescence of the satellites. Irradiation therapy occasionally seems to encase the cancer cells in a fibrous scar within which the cells may remain viable for long periods only to escape later and grow again. Alteration of the endocrine balance within the host may have a stimulating or depressive effect on some neoplasms.

EFFECT OF TONSILLECTOMY ON SINGING

To the Editor:—*I would like to know the consensus regarding tonsillectomy affecting a singer's voice. My question concerns a 20-year-old male with a baritone voice.*

Odell J. Kirksey, M.D., Mulberry, Ark.

This inquiry was referred to two consultants, whose respective replies follow.—Ed.

Answer.—Tonsillectomy, done with a careful dissection technique and with a minimum of scarring and attention to preservation of the plica triangularis at the base of the anterior pillar, cannot result in alteration of the voice of a singer or any other individual. Difficulties have arisen from the fact that an individual who had not attained desired success in a singing career blamed his failure to succeed on tonsillectomy. One should be sure, therefore, that any singer for whom tonsillectomy is contemplated is a well-adjusted person.

Answer.—It is the consensus at the present time that tonsillectomy does not affect a singer's voice permanently in any unfavorable way. There may, however, be a temporary impairment of short duration, until the pharyngeal muscles readjust themselves.

ACNE AND SUNLIGHT

To the Editor:—*A girl, aged 19, has mild acne. She reached a late puberty. She has been under treatment by two reputable dermatologists, who agree as to therapy, namely, orally given estrogen, low-fat diet, no chocolate, good bowel hygiene, and carbon dioxide snow administered at intervals with astringent lotions; however, one tells her never to expose her skin to the sun and the other tells her to sun bathe frequently. What is your opinion as to the best therapy and diet and as to sun exposure?* *T. H. Wallis, M.D., Ocala, Fla.*

Answer.—The management of the individual case of acne depends on the probable factors that seem to be involved. For example, systemic antibiotic therapy with one of the tetracycline preparations may be indicated and effective for certain types of cases and of no value in others. The same statement may be made in regard to estrogen therapy, which, in general, is reserved for female patients who have distinctive premenstrual exacerbations. Almost all dermatologists agree that interdiction

---

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

of nuts and chocolate is mandatory. Other therapeutic approaches that are in order for most patients with acne include appropriate local therapy, which must be individualized for a given patient, proper cleansing of the skin, treatment of the scalp if there is seborrheic dermatitis, and attention to systemic factors such as constipation and anemia.

The specific question regarding exposure to sunlight has been asked. Here again, the effect of sunlight exposure in patients with acne is highly individualized. Many patients with acne note that the condition is markedly improved on exposure to sunlight, while others note an exacerbation of the process on exposure to sunlight during summer months. Dermatologists in the Southwest, in particular, observe patients who have acne lesions only in summer and refer to the condition as "summer acne." Increased heat results in increased sebaceous secretion. Increased exposure to sunlight results in an increase in the keratin layer of the skin; this might account for the fact that some patients with acne note an exacerbation of the condition under these circumstances, due to obstruction of the pilosebaceous apparatus orifice. It is the opinion of this consultant that exposure to sunlight should not be interdicted in patients with acne unless it is evident that the condition is made worse by such exposure. Certainly, a young girl with acne should not deprive herself of outdoor activities that involve exposure to the sun unless this results in an obvious exacerbation of the disease or unless it appears that the condition is not improving despite other adequate therapy, in which case it might be justified to try avoidance of sunlight exposure for a trial period of at least several weeks; further instructions about exposure to sunlight for the patient in question depend on the results of such trial observation.

PROLONGED USE OF CORTICOSTEROIDS

To the Editor:—*What danger is there for a child of one year to be on prolonged Meticortelone medication for severe asthma? What dosage is safe and for how long? By danger I refer to endocrine changes, temporary and permanent, such as precocious development and stunted growth.*

Edwin A. Mickel, M.D., Drain, Ore.

Answer.—There are a number of hazards in the prolonged use of the corticosteroids for persons at any age. Prednisolone (Meticortelone) and prednisone have practically the same hazards as the older corticosteroids (cortisone and hydrocortisone), with the exception that they have less effect on sodium retention and potassium depletion. The question of special dangers in young children and infants has been in debate. The general feeling is now that such changes as the questioner describes are unlikely to occur. Even if they should, there is no reason to believe that discontinuance of the use of the drug would not cause a reversal. On weight basis the dose in children is proportionately greater than in adults. A one-year-old would take about one-half of an adult dose. This might mean 10 to 15 mg. in divided doses daily at first, gradually reduced to a maintenance dose of 2.5 to 7.5 mg.

ROPHYLAXIS OF RHEUMATIC HEART DISEASE

o the Editor:—*Is the administration of penicillin tablets to patients who have had a rheumatic infection of the heart in childhood recognized therapy? Is the administration of sulfonamides on and off recognized as good therapy?*

Herman Cohen, M.D., Bronx, N. Y.

Answer.—It is generally agreed that the initial and recurrent attacks of rheumatic fever and rheumatic heart disease are caused by the group A beta-hemolytic streptococci. The recurrence of the infection can be prevented through the use of either penicillin or a sulfonamide. Either drug should be administered daily, until the patient has reached the age of 18, or for a period of at least five years in all patients who have had rheumatic fever after the age of 13. Penicillin should be given orally, in doses of 300,000 units twice daily. Sulfadiazine is given in 0.5-to-1-gm. doses daily, depending on the weight of the patient. Some workers in this field advocate lifetime prophylaxis. Whichever of the two drugs is used, the administration must be continuous and not "on and off."

SIMPLE (WIDE-ANGLE) GLAUCOMA

To the Editor:—*An acute postanesthetic episode of glaucoma occurred recently in a patient with a wide-angled anterior chamber who occasionally developed a high intraocular pressure after administration of Cyclogyl. This patient had been given scopolamine in preparation for an operation and required some very active measures in the immediate postoperative course for the control of the tension. Have any measures been instituted, considering this possibility, in a patient with a history of glaucoma or in older patients who show rather dilated pupils at the end of anesthesia?*

S. B. Forbes, M.D., Tampa, Fla.

Answer.—By definition, etiology, and physiology, simple (wide-angle) glaucoma is not characterized by a marked increase in the intraocular pressure when the pupil is dilated. A characteristic rise occurs in the angle-closure type of glaucoma, in which pupillary dilation induces closure of the angle of the anterior chamber due to crowding of the iris into the angle and the creation of a relative pupillary block. In such a person undergoing general anesthesia, every effort must be made to maintain maximum pupillary miosis. Cholinergic blocking agents such as scopolamine and atropine should be used minimally and miotics should be used routinely to maintain constriction of the pupil. Usually, a more frequent instillation of the miotic usually used by the patient is all that is required. General anesthesia will not overcome this drug-induced miosis except in a very deep stage, usually not approached clinically.

HEMIPLEGIA AND YAWNING

To the Editor:—*In three recent cases of hemiplegia due to cerebral vascular accidents the following incidents occurred: When each of these three patients yawned the paralyzed arm flew upward and over the head. In two the hemiplegia is on the right side, and in one the left side is effected. Can you name this phenomenon?*

M.D., Indiana.

Answer.—The phenomenon of yawning associated with forcible lifting of the paralyzed arm to the area of the head is a quite common one. It is due, of course, to a mass reflex, which undoubtedly originates in the lower cervical and upper thoracic portions of the spinal cord and is motivated by movement of the lower jaw and the platysma, sternocleidomastoid, and scalenus muscles. So far as is known to this consultant, the phenomenon does not bear a proper name.

OXSORALEN

To the Editor:—*I am interested in the use of Oxsoralen in the treatment of vitiligo, the local application of which produced a marked erythema, which has persisted for a month and caused considerable annoyance. Is this a safe preparation to use?*

M.D., Illinois.

Answer.—Oxsoralen in either capsule form for oral administration or in solution for topical use is a potent chemical. In addition to irritation of certain internal organs, its oral administration can cause, in some people, dependent upon length of exposure to sources of actinic rays, variable degrees of hyperpigmentation and dermal ulceration. In its topical use it is also a strong irritant; more so when exposed to sunlight. It is also capable of producing a local sensitivity to an area treated, so that local itching and burning can occur for a variable time thereafter on exposure to sunlight—natural or artificial. The preparation is safe to use. On first application dilute the original solution one-half with a diluent composed of equal parts of propylene glycol and water. The second application should be three-fourths Oxsoralen and one-fourth water; thereafter use full strength. The exposure for each application should begin with one minute measured time; increase one minute for each subsequent application. For the sensitized areas, application of sunburn preventive creams will usually be of aid in reducing the pruritus. For more details see New and Nonofficial Remedies, 1956, page 526.

USE OF ANTIBIOTICS INTRAPLEURALLY

To the Editor:—*It has been our custom to use penicillin and streptomycin intrapleurally both after intrathoracic operations and for acute and chronic pleural infections. In many cases the patient is sensitive to penicillin and occasionally to streptomycin, and the use of another preparation or combination of preparations would be desirable. Some of the more recently developed effective antibiotics are quite irritant when in solution and probably should not be used intrapleurally. Can you supply information regarding which of these antibiotics can be used intrapleurally in solution and what strengths should be used? What antibiotic or combination would be as effective as 1 million units of penicillin and 1 gm. of streptomycin left in the pleural space after a pulmonary resection, in which there was definite evidence of contamination, as may occur in resections for bronchietasis or other lung infections?*

John C. Crenshaw, M.D., Shreveport, La.

Answer.—While it is true that some of the antibiotics are irritant to the pleural cavity, probably all of them have been used to some extent. Erythromycin, the tetracyclines, polymyxin B, and bacitracin all have had limited use. Specific information concerning the use of erythromycin can be found in Antibiotics Annual 1955-1956 (New York, Medical Encyclopedia, Inc.), which gives instances in which a 1% solution was used with dosages varying from 250 to 1,000 mg. Without clinical trial it is not possible to recommend a dose of an antibiotic or combination that would be as effective as "1 million units of penicillin and 1 gm. of streptomycin," however, certain broad principles can be laid down. Bacitracin and erythromycin are active primarily against gram-positive bacteria, while polymyxin B and streptomycin are primarily active against gram-negative bacteria. Therefore, combinations of either erythromycin or bacitracin with either polymyxin B or streptomycin should cover the same general bacterial spectrum as penicillin and streptomycin. The tetracyclines are active against both gram-positive and gram-negative bacteria and may be used successfully alone. The efficacy of each antibiotic or combination depends on many factors, including the sensitivity of the offending organisms, the length of time that they would be exposed, the diffusion and excretory rate of the antibiotic, and the rapidity of the development of resistance.

PLASTIC BAGS FOR STORAGE OF BLOOD

To the Editor:—*We are interested in the use of disposable plastic transfusion sets that include a bag for collection of blood and plastic tubing for taking and giving this blood, as made in the United States. What type of plastic is used in making these sets, and how are they sterilized, by heat or by chemical process?*

M.D., India.

Answer.—Plastic bags for collection and storage of blood are allowed to be sold in the United States only after the manufacturer has presented adequate data to the Food and Drug Administration to obtain an effective New Drug Application. The sterilizing process used depends upon the type of plastic incorporated in the infusion set. Some plastics are autoclaved; others are chemically sterilized by using a gas such as ethylene oxide. It may be helpful to the reader to know that the United States Pharmacopeia, 15th revision, outlines certain test procedures covering final quality of plastic or nonplastic infusion sets.

BELL'S PALSY

To the Editor:—*Has the cause of Bell's palsy been determined? Is there any proof that exposure to cold drafts and inclement cold weather play a part in the etiology? Is there any statistical information as to the incidence of Bell's palsy in temperate and cold climates versus the incidence in hot climates?*

Townsend W. Baer, M.D., Pittsburgh.

Answer.—The term Bell's palsy is often used as a synonym for the lower motor neuron variety of facial paralysis, but the term should be used only if the paralysis is the result of a lesion peripheral to the geniculate ganglion. Peripheral facial paralysis, including the type usually referred to as Bell's palsy, may be due to a number of different causes, and it is not possible to state that any single cause has been determined. The current concepts of etiology include edema or periostitis of the facial canal, ischemia of the nerve, a parenchymatous neuritis, and infection by a neurotropic virus. On decompression of the facial canal in cases of Bell's palsy, the nerve has been found to be either enlarged or edematous. Consequently, most observers believe that edema, periostitis, and/or ischemia of the nerve are the most important factors in the majority of cases and that any or all of these may cause a physiological or even anatomic block of the nerve.

Because there is sometimes a history of exposure to the wind or cold on the involved side of the face, either such exposure alone or low temperature has been cited as a cause of the paralysis. There is, however, no factual proof that exposure to cold drafts and inclement cold weather are actual causes, although one can postulate that they may be precipitants, if either infection, edema, or ischemia is the underlying cause. No statistical reports of the incidence of Bell's palsy in temperate and cold climates versus that in hot climates are available, but most of the reports on large series of cases do come from the northern parts of the United States and of Europe. Three such recent studies from England, which might indicate the frequency of the condition there, are by James and Russell (*Lancet* 2:519, 1951), Taverner (*Brain* 87:209, 1955) and Wyburn-Mason (*Brit. M. J.* 2:679, 1954).

PHENYLALANINE IN FOODS

To the Editor:—*We have run tests for phenylpyruvic acid in the urine of 868 feebleminded patients and found nine cases of phenylpyruvic oligophrenia. Could you tell us what foods contain phenylalanine?*

M.D., Mississippi.

Answer.—Phenylalanine is an essential amino acid, and the complete elimination of it from the diet would be unwise. However, it has been demonstrated that tyrosine (hydroxyphenylalanine), a nonessential amino acid, apparently has a phenylalanine-sparing effect, since up to 50% of the phenylalanine requirement can be met by tyrosine. This is probably due to the fact that tyrosine is converted in the body into phenylalanine. According to Rose (*Federation Proc.* 8:546, 1949), the minimum daily requirement for phenylalanine is 1.1 gm. and the recommended daily intake is 2.2 gm. The following table adapted from the book "Nutrition and Diet in Health and Disease" by McLester and Darby (Philadelphia, W. B. Saunders Company, 1952) indicates the amount of phenylalanine present in some common foods.

Amount of Phenylalanine in Some Common Foods

Food	Phenylalanine (Gm./100 Gm.)
Whole egg	0.8
Egg albumin	0.9
Egg yolk	0.7
Milk	0.2
Liver	1.2
Pork, fresh	0.5
Steak, cooked	0.8
Leg of lamb, fresh	0.6
Leg of lamb, cooked	0.8
Corn	0.5
Whole wheat	0.5
Oats	0.7
White potatoes	0.1
Peas and beans	1.0

DIARRHEAS

To the Editor:—*I would like to know how much potassium to give in diarrheas or protracted illnesses in pediatric cases. Also please indicate the proper fluids to use, with amounts, in severe diarrheas.*

M.D., Massachusetts.

Answer.—The amount of potassium that should be administered in diarrheas and related conditions depends on the duration of the disease entity in question, the physical state of the patient, and the degree of plasma potassium depletion, all in relation to the total extracellular fluid and other electrolyte status at the time. The normal plasma potassium value is 4.0 to 5.6 mEq. per liter. The extent of depletion would have to be evaluated in view of this norm and in relation to the other cations—sodium, calcium, and magnesium—and in some degree to the anions—chloride, bicarbonate, proteinate, phosphate, sulfate, and organic acids of the plasma. The limited space here afforded precludes an answer to the "proper fluids to use in severe diarrheas." Many criteria would have to be established to answer this question intelligently. The inquirer is referred to the following less complicated references for an answer to this general question: The A B C's of Fluid Balance by Snively and Wessner (*J. Indiana M. A.* 47:957, 1954); Systematic Approach to Fluid Balance by Snively, Sweeney, and Wessner (*GP* 13:74, 1956); and either or both of two monographs covering the subject in an elementary way: "Simplified Parenteral Fluid Therapy" and "Fluid Therapy in Infants and Children," which may be obtained from Mead Johnson & Company, Evansville, Ind.

PRESBYOPIA AND TARGET SIGHTING

To the Editor:—*A patient, aged 54, has difficulty in sighting across a pistol. Because of presbyopia, he can see his distant target but cannot get a clear view of his sights. This problem has arisen before, and no answer has been found in the literature.*

Karl J. Chiapella, M.D., Chico, Calif.

Answer.—Experience has shown that those who shoot with both eyes open see the target brighter, clearer, aim faster, and avoid spasm of accommodation and the handicap of left-eye dominance if present. In binocular sighting, when no significant ocular muscle imbalance is present, the impressions from the two eyes are synthesized to the same direction as is demonstrated in the following experiment. Place in front of the front sight a card just large enough to obstruct the view of the target. With both eyes open the target is seen through an apparently transparent card, and, if the aim is true, the bull's eye is hit even though the target is seen with one eye and the sights are coordinated with the other. Hence one eye can be focused for the sights while the other sees the target. For viewing the sights, Obrig (Modern Ophthalmic Lenses and Optical Glass, New York, T. E. Obrig, 1935, p. 269) suggests a small round segment, 16 to 20 mm. in diameter, placed near the nasal border of the lens and centered horizontally with the center of the pupil. With the arm extended, if the distance of the front sight from the spectacle level is 67 cm., the vergence is 100/67 or 1.5 D., the addition required. Since this patient has 0.50 to 0.75 D. of available accommodation, he should sight clearly across the barrel. The addition determined can be incorporated in a Behr spectacle loupe, an inexpensive contrivance used by jewelers, which can be clipped to his distance spectacles and rotated readily in or out of position. To test for the precise addition, place the distance correction in the left cell of a trial frame and the shooting correction in the right cell, while the marksman aims his pistol at a target seen through the window. Among the contributors to this subject are G. A. Berry (*Edinburgh M. J.* 10:486, 1913), R. O'Connor (*Ophthalmology* 11:745, 1915), R. W. Doyne (*Ophthalmoscope* 13:119, 1915), and J. E. Lebensohn (*U. S. Nav. M. Bull.* 40:590, 1942).

CESAREAN SECTION IN PATIENT GIVEN PENTOTHAL

To the Editor:—*In doing a cesarean section for which the patient has been given only Pentothal, what is the maximum time one can allow for extracting the baby and clamping the cord? In other words, how long does it take for Pentothal to pass the placental barrier in sufficient amount to interfere with spontaneous breathing on the part of the baby?*

M.D., Virginia.

Answer.—In a study of maternal and infant cord level in patients who had received Pentothal during labor, this consultant and associates found equal levels of concentration within two minutes after injection. An incident is known of an infant, delivered by elective cesarean section, who had definite signs of cerebral anoxia one minute after the drug was given. A "placental barrier" that interferes with the transmission of most barbiturates probably, in a true sense, does not exist. Blood oxygen concentration at the placental site of undelivered babies, the brain center and respiratory mechanism of the individual fetus, the known higher incidence of respiratory difficulties in infants delivered by elective cesarean section, and the question of immaturity and prematurity all are pertinent to this discussion.

HYPERTENSION AND ENLARGED TONSILS

To the Editor:—*A 57-year-old man was found to have a systolic blood pressure of 245 mm. Hg. The patient had no symptoms of hypertension, except a mild degree of forgetfulness. His blood pressure had been taken a year previously, before he was operated on for the repair of an inguinal hernia, and was found to be 145/80 mm. Hg. After the incidental finding of high systolic pressure, the patient was examined physically and was found to be normal. His urinalysis and blood nonprotein nitrogen level were within normal limits. A course of treatment with reserpine, testosterone, and nicotinic acid failed to alter his pressure considerably. A colleague advised the removal of his tonsils, which were found to be enlarged. After tonsillectomy in another city, his systolic pressure was reported to have dropped to 170 mm. Hg and to have remained at that level for a month or two. However, on his arrival at his native town, his systolic pressure was 235 mm. Hg. His systolic pressure has remained elevated since then and fluctuates between 225 and 245 mm. Hg, despite regular ingestion of reserpine and nicotinic acid tablets. An explanation for the high blood pressure in this patient would be appreciated. Also, is there any relation between the enlarged and inflamed tonsils and high blood pressure? The altitude of the town at which the patient lives is 1,450 m.*

Ahmed Khosrowshahi, M.D., Tehran, Iran.

Answer.—There is no established relation between enlarged tonsils and hypertension. Tonsillectomy should be performed only if infection or a similar indication exists, not because of hypertension. It is well known that a nonspecific temporary reduction of blood pressure often follows an operation. The reduction after tonsillectomy would not be related to the cause of hypertension. The clinical summary did not indicate that any tests had been used to rule out pheochromocytoma. Phentolamine (Regitine) hydrochloride or piperoxan (Benodaine) should be given in test doses and the patient observed for reduction of blood pressure. Also pulses and blood pressure in the legs should be evaluated to rule out aortic obstruction by coarctation. High altitude can cause an increase of the number of red blood cells. It should be determined whether this patient has such an increase or even a true polycythemia, since this could be related to the altitude and the hypertension. If these examinations are negative, the patient should then be considered as having the usual type of arterial hypertension.

BCG VACCINATION

To the Editor:—*In* The Journal, *March 31, page 1183, and June 30, page 926, in Queries and Minor Notes, questions about BCG vaccinations were raised. In the answer to the March 31 query, the writer states, "Inasmuch as an attack of tuberculosis, either mild or severe, does not produce dependable immunity, there is no premise for attempts to produce immunity artificially by any one of the several agents now available in this country and abroad, including BCG." It has been shown repeatedly that a healed primary infection in a young adult produces a definite increased resistance against subsequent exposure to the tubercle bacillus. The study of Bates and Davey at the University of Michigan (*Am. Rev. *Tuberc. 63:332, 1951) clearly demonstrates the resistance of tuberculin reactors among students of nursing and medicine to tuberculosis. In a 10-year observation period there were 20 cases of tuberculosis, ranging from minimum to moderately advanced with cavity formation. All of these students were negative reactors to tuberculin (up to 0.005 mg. of purified protein derivative) on admission to school. There were no cases of tuberculosis in the students with positive tuberculin reactions at the start of training. Similarly, Dr. J. Arthur Myers and his group (*Ann. Int. Med. *14:873, 1940) found that during training in one nursing school with 12 weeks of tuberculosis service, one case of pleurisy with effusion developed in the 48 originally positive reactors (up to 1 mg. of old tuberculin), whereas 11 cases (6.2%) of clinical tuberculosis developed in 178 originally negative reactors. Seven of the latter were hospitalized for periods up to two years, and two died of tuberculosis. A small percentage of individuals who are infected with tubercle bacilli develop clinical disease that subsequently relapses. These individuals are most probably a highly susceptible group who have little capacity for developing resistance against tuberculosis, much the same as Lurie (*Proc. Soc. Exper.*

Biol. & Med. *39:176, 1938; ibid. 39:181, 1938) demonstrated in his susceptible rabbits. Rich (Pathogenesis of Tuberculosis, Springfield, Ill., Charles C Thomas, Publisher, 1944) states, "It is an example of the treachery of terms that the statement on the part of some authoritative writers that there is no acquired immunity in tuberculosis (meaning that thereby one resisted infection does not confer complete and permanent protection against subsequent disease) has led many to believe that a tuberculous infection confers no protection at all [Myers, J. A.:* J. Pediat. *10:267, 1937] in spite of the great evidence to the contrary." (See also the more recent article by Myers [*J. A. M. A. *146:1492 (Aug. 18) 1951].) That BCG vaccination confers an increased resistance against tuberculosis in all age groups has been well demonstrated in the United States and abroad (Aronson and Aronson:* J. A. M. A. *149:334 [May 24] 1952. Rosenthal and Leppmann:* Tr. Nat. Tuberc. A. *49:161, 1953. Rosenthal:* J. A. M. A. *157:801 [March 5] 1955). The most recent study (1956) conducted by the National Research Council of Great Britain in some 57,000 adolescents again confirms unequivocally the effectiveness of BCG vaccination. They found a reduction of 82% in the incidence of tuberculosis in the BCG-vaccinated group as compared with the tuberculin-negative group not vaccinated. In regard to the harmfulness of BCG—there have been over 100 million vaccinations with relatively few complications and no absolutely proved cases of death as a result of the BCG itself. However, even if we accept the five cases referred to in the answer to the query (March 31), it is much less than the complications following smallpox vaccination (1 case of encephalitis in 15,000 vaccinations). The fact that BCG vaccination is mandatory by law in such countries as France, Norway, Denmark, Finland, Brazil, and Japan and that it has been accepted by the World Health Organization, the National Tuberculosis Association, and the National Research Council of Great Britain—all highly conservative bodies—speaks highly for its safety. It is of interest that the University of Illinois and the Research Foundation supply vaccine to some 390 users in 46 states. This includes 37 medical schools, 104 schools of nursing, and 230 hospitals. These users employ the multiple puncture disk for vaccination. In tens of thousands of vaccinations, none have reported local or general complications of any consequence. This is in sharp contrast to the remarks of the June 30 query, where it is stated that "abscesses and ulcers at the site of administration [of BCG] and clinical disease of the regional lymph nodes occur with considerable frequency following its administration."*

Sol Roy Rosenthal, M.D.
Director, University of Illinois
Institution for Tuberculosis Research
Chicago 12.

Dr. Rosenthal's letter was referred to the consultant who answered the two queries and minor notes under discussion, and his reply is, in part, as follows.—Ed.

To the Editor:—*Your correspondent's statement to the effect that it has been shown repeatedly that a healed primary infection in a young adult produces increased resistance against tubercle bacilli is obsolete. There is no way to determine that a given primary lesion is healed except through biopsy or autopsy. Moreover, if one primary lesion were found to be healed, numerous others are present in the same body that may contain necrotic tissue harboring virulent tubercle bacilli. Calcific deposits in the lungs seen by shadows on x-ray films by no means indicate that the lesions are healed. Calcification is not a specific process. Moreover, calcium deposits are laid down in dead tissue. There may be an abundance of necrotic tissue around them harboring tubercle bacilli or even active tuberculosis in living tissues in adjacent areas without being revealed by x-ray shadows. Longitudinal studies of both tuberculin reactors and nonreactors have shown that clinical lesions develop only in tuberculin reactors. About as soon as persons who have been nonreactors become infected and react to tuberculin, a small percentage show primary pulmonary infiltrates, large and dense enough and so located as to cast visible x-ray shadows. They should never be classified as clinical lesions, as they are Ghon tubercles in the inflammatory stage. It is usually months and more often years before these recent reactors who are destined to develop clinical tuberculosis do so.*

J. E. Perkins, managing director, National Tuberculosis Association, recently stated that between 50 and 60 million people in the United States are tuberculin reactors and that these people are harboring the seeds, thus constituting a stockpile of tuberculosis. He states that, if the rate of breakdown with active disease among these infected individuals continues as at present, then 2,700,000 people who are tuberculin reactors today will have active tuberculosis during their lifetime. This is a sound statement and is based on careful study and long periods of observation by students of tuberculosis.

In citing the findings of J. Arthur Myers and his group, the correspondent referred to a paper written 16 years ago, before it was so well known that demonstrable lesions found about the time individuals become sensitive to tuberculin are always primary infiltrates (Ghon tubercles). Although this act has now been well established, Ghon tubercles in the inflammatory stage are still being classified by some workers as clinical lesions, resulting in misinformation and much confusion. A more recent reference could have been made to J. Arthur Myers and his group. For example, in a paper entitled "Tuberculosis in Physicians," in The Journal, *May 7, 1955, page 1, they stated that throughout their period of observation, from 1927 to 1953, more physicians had developed clinical tuberculosis among those who had reacted to tuberculin on admission to school than among those who became reactors while in school or subsequently. Also, among the physicians who had graduated from their medical school between 1919 and 1932, 92 had developed tuberculosis, of whom 11 died, while in school or after graduation, whereas, in the past 10 years, only one student had developed a pulmonary lesion large enough to be found by its x-ray shadow, and he had been known to be a reactor to tuberculin since the age of 14 years.*

It is only tuberculin reactors who can develop clinical disease and have subsequent relapses. Allergy produced by the first infection converts tuberculoprotein into a violent poison to cells and tissues, and it is this that results in necrosis when tuberculoprotein comes in contact with sensitized tissues, which is clinical tuberculosis. Endogenous reinfections are responsible for all of the acute rapidly progressive forms of tuberculosis, such as meningitis and miliary disease, and, there is reason to believe that endogenous reinfections are responsible for the bulk of chronic tuberculous processes. The committee on vaccination of the National Research Council of Great Britain outlined a splendid study, but it neglected the most crucial point, namely, differentiation between primary pulmonary infiltrates, which are Ghon tubercles in the inflammatory stage, and clinical reinfection type of pulmonary lesions. Had this differentiation been made, it would have accounted for most of the difference reported between lesions found among the naturally infected and the artificially infected adolescents. Moreover, the period of two and one-half to four years of observation was too short to justify conclusions. Ten years would not have been enough, since tuberculosis is a lifetime disease.

*Last year, James (*Am. Rev. Tuberc. *71:321, 1955) wrote from the Dungannon Chest Hospital in northern Ireland, "I believe that BCG is the most dangerous substance which has ever taken shelter behind the principle of protective inoculation, and I can only suppose that its harmless reputation is based on the propagandists' axiom that, if a statement is repeated sufficiently often, it will eventually reach the status of truth." Many persons who have had BCG have subsequently developed clinical tuberculosis, and a number have died from this disease. It does not seem unreasonable to expect BCG to produce mild, serious, and fatal disease in people, since it produces progressive and often killing disease in mice on deficient diets (Dubos: editorial,* Am. Rev. Tuberc. *60:670, 1949), guinea pigs with silicosis (Vorwald and others:* Am. Rev. Tuberc. *62:455, 1950), normal golden hamsters (Hauduroy and Rosset:* Compt. rend. Acad. sc. *232:445, 1951), and ground squirrels (Hauduroy and Rosset:* Experientia *9:267, 1953).*

*No report yet made on the efficacy of BCG has been adequately documented, and the bulk of the work on the 100 million the correspondent refers to has had so little follow-up of cases as to be worthless. Khairat (*Journal-Lancet *74:128, 1954) said, "In Egypt, possibly the reported low incidence of abscess formation after BCG vaccination since 1950 was partly due to* *exposure of the vaccine to direct sunlight, but was mainly attributed to the impossibility of collecting accurate statistics, especially since adenitis and suppuration occur late—sometimes seven months after vaccination, and not necessarily at the site of the injection, so that the victims do not associate the late complication with the earlier injection. Moreover, the average Egyptian peasant is not usually anxious to take the trouble to notify the statisticians, so that their statistics may be accurate! I have received many letters from parents of school children who were inoculated, and even from government doctors who injected BCG describing the occurrence of these abscesses in Egypt. It is regrettable that the poor peasants were not informed of the true nature of the vaccination, but were told instead, it was a 'health-giving' injection." From available evidence, the follow-up work has been no better in most nations where mass BCG administration has been employed.*

With reference to the BCG produced and distributed by the University of Illinois and the Research Foundation, it should have been stated that the culture was found to be from 10 to 100 times weaker than the one produced in other laboratories. Moreover, the Research Foundation's culture is said to contain so few living bacilli that difficulty has often been experienced in producing tuberculin reaction in the recipients. The meaning of the statement, "None have reported local or general complications of any consequence," is not clear. How serious must complications be before they are of "any consequence"? Reactions at sites of administration are tuberculous lesions with regional lymph node components. Moreover, every individual who becomes a tuberculin converter has such lesions whether or not they are in evidence superficially. Vorwald and associates (Am. Rev. Tuberc. *62:455, 1950; ibid. 69:766, 1954) produced progressive and killing tuberculosis in guinea pigs with silicosis with this culture of BCG just as readily as with the Aronson culture. It seems paradoxical that this correspondent should be strongly recommending the use of BCG in the United States at a time when nations that have had most experience with it, including Scandinavian countries, are proposing its discontinuance (Wallgren:* Acta paediat. *44:237, 1955; Scandinavian Symposium: Is Mass BCG Vaccination Still Justified in Scandinavia?* Nord. med. *55:21, 1956).*

FRAGILITAS OSSIUM

To the Editor:—*The following case may interest physicians who read the reply in reference to bone fragility in* The Journal, *June 23, 1956, page 773. In 1928, I saw a boy aged 13 who had had 13 fractures, all but one related to his large extremities, the exception being of a finger. The first one occurred when he was 14 months old and the next four months later. He had been nursed by his mother for nine months. His brother, then 6½ years old, had never had a fracture. The father and the mother of these children were first cousins. The parents of these parents, on both sides, had also been related, in the same way. The parents of the above child were about the same age. There had been two miscarriages, both in the third month, before the patient was born. Both boys were delivered by cesarian section, the mother being rachitic. Between the ages of 7 and 11½, our patient had had no fractures. The last fractures occurred in both elbow joints, one of them being quite complicated. Among the immediate causes of the fractures was a fall from the roof of a small house, but the others were apparently insignificant, such as slight fall, hurt, or pulling of hand.*

The patient weighed 111 lb. (50.3 kg.) and was 26 lb. (11.8 kg.) overweight. The cranium was extraordinarily large and the neck short. There were no other signs of rickets. Otherwise, the child was in good health. He had had measles, whooping cough, and chickenpox. "He never catches cold," the mother said. A hospital report from the same year stated: "Admitted with fracture of right olecranon process. There seemed to be no evidence of rickets, rather fragilitas ossium. Blood count was normal, so was the urine analysis; nose and throat smears were negative for diphtheria."

A plan was devised and instructions given about methods of living and eating, including use of hydrotherapy. They seem to have been followed. No fractures occurred after that time. In 1932, the patient complained of gradual loss of hearing, which had been subnormal earlier. He could not hear the teacher in the classroom. Deafness was developing equally on both sides, and it could not be explained by any local cranial fractures. His blood pressure was somewhat higher than normal. The mother, 27 years old at this child's birth, was short and squat, had a large skull, and was and had apparently always been almost totally deaf. The patient's brother, while not suffering from the bone disease, was also hard of hearing. When seen again in 1939, the patient had been treated elsewhere for deafness. Therapy was endocrinological and was unsuccessful. At this time, deafness was complete. He was 24 years old and his blood pressure was 170/60 mm. Hg. In 1944, a hospital report, after a thorough consultation study, stated: "Otosclerosis, basal metabolic rate 10%, severe psychoneurosis." The latter statement was erroneous. The patient was not only highly intelligent but also mentally and emotionally normal. In 1948, he was married to a healthy, nonrelated girl. Four years later, when I saw them, they had two children, one about 2 years old and one under a year. The first baby had suffered three lower extremity fractures already, and the youngest was born with two fractures, one in each leg. I was told that, except for the fractures, which healed easily, these babies were in good health. Also, so far, their hearing did not seem to be affected. The literature on this subject, with which I am acquainted, is poor and unsatisfactory.

Benzion Liber, M.D., Dr. P. H.

New York 25.

MILD DIABETES

To the Editor:—*In* The Journal, *July 7, 1956, page 1031, under the heading "Mild Diabetes," there is a query about the necessity of giving insulin to patients with mild diabetes. In the answer, the indications for insulin are discussed properly, but it is said that, in a middle-aged patient, the question may arise "whether one, two, or three sulfonamide tablets a day would control the blood sugar level." The consultant apparently had in mind the hypoglycemic sulfonamides (tolbutamide [Orinase] or carbutamide [Orabetic]), which are presently being investigated for their efficacy in controlling mild diabetes. The general reference to sulfonamides, however, may cause the impression that any sulfonamide is hypoglycemic. This is certainly not correct. Most of the conventional sulfonamides do not affect the blood sugar level at all; some even elevate it.*

Brooklyn 3, N. Y.

VAGINAL DOUCHES

To the Editor:—*In* The Journal, *Aug. 25, 1956, page 1718, there is a question about douching with Burow's solution in a case of "simple, clear, not infected oversecretion of mucus" from the vagina. I agree with the second answer but must point out that some of the statements are not pertinent to a "clear, not infected oversecretion." Such a condition is the result of local congestion, the cause of which may be anything from constipation to psychic factors. We see it in schoolgirls, particularly in ambitious girls, around examination time and see it clear up spontaneously during vacation time. Douches often transform such an increase of normal secretion, the result of an increased lymph transudate from perivaginal sources, into a real discharge by introducing pathogenic bacteria and reducing the normal, protective vaginal acidity. Furthermore, douching tends to focus attention on a harmless symptom and leads to overrating the importance of the disturbance. In the case cited, Burow's solution apparently, so far at least, has prevented infection; however, it is, as was pointed out by your consultant, "unphysiological" to say the least. The only way to treat a case of the type cited is to find the cause for the pelvic congestion and remove it.*

Draft of Medical and Scientific Personnel • •
Seven Federal Research Grants Total $765,159 • •
Modifications of Disability Payments Plan • •
1953 Grants to Nonprofit Research Institutes • •
Fourth Annual Symposium on Antibiotics • •

THE SPECIAL DOCTOR-DRAFT ACT

Officials of the Defense Department already have started discussions with professional groups concerning the call-up of medical and scientific personnel after next July 1, when it is expected the special doctor-draft act, passed in 1950, will be allowed to expire. Called in for an exchange of views have been representatives of the American Medical Association, the American Dental Association, the Association of American Medical Colleges, and the surgeons general of the Army, the Navy, the Air Force, and the U. S. Public Health Service. The discussions were initiated by Dr. Frank Berry, Assistant Secretary of Defense for health and medical matters, who is responsible for advising Secretary Wilson on policy regarding the procurement of medical personnel.

One of the questions to be discussed is whether any change in the basic selective service act will be necessary to facilitate the selective call-up of certain physicians and other specialists, including scientists, who are deferred for educational and occupational reasons. This is the present situation: Although all physicians registered under the regular draft technically will continue to be liable for service up to age 35, few if any of those over age 30 are apt to be called, as the Defense Department estimates that the majority of its needs can be met by recent graduates of medical schools.

FEDERAL RESEARCH GRANTS

More than 200 medical institutions of various types have made inquiry concerning federal research grants under the new 30-million-dollar-a-year program authorized by the last Congress. Money, to be matched 50-50, can be used for buildings or equipment for medical research. The first grants totaled only $765,159, going to seven institutions. Twenty-four other applications were considered by the National Advisory Committee on Research Facilities at its first meeting, but, according to the Public Health Service, information furnished on which to make a decision was inadequate. Surgeon General Burney said the seven requests honored were the only ones that contained complete data and were the only projects that warranted "immediate support."

Amounts of the first grants and recipients were as follows: Massachusetts General Hospital for a neurosurgical floor, $95,045; Albany Medical College of Union University (Albany, N. Y.), new animal quarters, $45,000; Christ Hospital Institute of Medical Research (Cincinnati), additional floor in medical research building, $184,000; University of Pennsylvania, radiology center, $179,000; University of Minnesota, $26,110 for anatomy research facilities and $161,000 for research facilities for physiological chemistry, physiology, and pharmacology; and Georgetown University, animal research laboratories, $75,000. The next council meeting is in December, at which time the PHS expects most of the remaining money out of the first year's 30 million dollars will be allocated. Grants are approved and announced by the surgeon general, but only after the council has acted.

DISABILITY PAYMENTS PLAN

Possible modifications in medical policy and medical administrative aspects of the new disability payments section of the social security act were discussed at a two-day meeting of the medical advisory committee to the Social Security Administration. The disability payments plan, providing OASI payments at age 50 to persons certified as totally and permanently disabled, was enacted by the last Congress. Also a part of the law is a "waiver of premium" program, passed in 1955, which "freezes" the OASI records of a disabled person so his ultimate pension is not reduced because of unemployment in the time before he becomes eligible for payments.

The chairman of the committee is Dr. J. Duffy Hancock, Louisville, Ky. Other members are Miss Pearl Bierman, Chicago; Dr. Philip D. Bonnet, Boston; Dr. Donald Covalt, New York City; Dr. Charles L. Farrell, Pawtucket, R. I.; Dr. J. S. Felton, Oklahoma City; Dr. Herman E. Hilleboe, Albany, N. Y.; Dr. Lemuel C. McGee, Wilmington, Del.; Dr. Kenneth B. McIntyre, Detroit; Dr. William A. Pettit, Los Angeles: Dr. Leo Price, New York City; Dr. William Harold Scoins, Fort Wayne, Ind.; Mr. Carroll Shartle, Columbus; Ohio; Mr. Byron Smith, Minneapolis; and Dr. David Wade, Austin, Texas.

Two representatives of the American Medical Association attended the sessions as observers. They are Dr. William Kennard of the A. M. A. Washington Office and George Cooley, Assistant Secretary of the

'LANOXIN'
brand
DIGOXIN

formerly known as Digoxin 'B.W. & Co.'®

for prompt digitalization and dependable maintenance

Dear Doctor:

The new name for Digoxin 'B. W. & Co.' is 'LANOXIN'. This change will now make it easier for everyone to distinguish digoxin from digitoxin.

Now, simply write...

'Lanoxin' Tablets
0.25 mg. or 0.5 mg.

to provide the safety and predictability afforded by the uniform potency, uniform absorption, brief latent period and optimum rate of elimination of this crystalline glycoside.

A pure, stable, crystalline glycoside isolated from Digitalis lanata...

Washington News—Continued

A. M. A. Committee on Medical Service. At the session, operational reports were received on the disability freeze program to date, the new (disability payments) program was explained, and reports were received on state agency operations. Also, proposed changes in medical standards for disability evaluation were discussed.

RESEARCH IN NONPROFIT INSTITUTES

In 1953 scientific research and development programs, including medical, in nonprofit institutes and commercial laboratories totaled an estimated 85 million dollars. Commercial laboratories spent about 35 million dollars for scientific research, while the nonprofit institutes spent more than 50 million dollars. The basic research and development effort in commercial groups amounted to 4 million dollars and in nonprofit organizations to over 3 million dollars.

This information is included in the National Science Foundation's report, "Research and Development by Non-Profit Research Institutes and Commercial Laboratories, 1953." The report, prepared by the Maxwell Research Center, Syracuse University, is one part of an extensive survey of research and development in all known U. S. nonprofit institutes and in a sampling of the commercial laboratories. The report notes that most of these research groups have been founded since 1941. This rapid increase largely can be attributed to the expansion of the federal government research programs and to federal aid to the private research groups. In 1953 the government granted to the commercial laboratories one-half of their expenses and to the nonprofit groups two-thirds.

SYMPOSIUM ON ANTIBIOTICS

The Food and Drug Administration, in association with the journals *Antibiotics and Chemotherapy* and *Antibiotic Medicine and Clinical Therapy*, will sponsor the fourth Annual Symposium on Antibiotics in Washington late this month. Medical scientists from the United States and nine foreign countries will report in 156 papers on recent discoveries in antibiotics. New antibiotics not yet commercially available and the use of combined antibiotic therapy will be described. An entire day's program will be devoted to the problem of antibiotics in food and their use in the preservation of foods. The panel discussion, to be moderated by W. A. Randall of the Food and Drug Administration, will consider in detail the use of chlortetracycline (Aureomycin) and oxytetracycline (Terramycin) in extending the shelf life of foods such as poultry and fish.

VA CONSTRUCTION PROJECTS

The Veterans Administration will open bidding in October and November on 22 construction projects costing a total of $4,425,000 to $6,320,000. The total cannot be determined until bids are accepted. The three major projects include alterations and additions to the VA hospital at Tuskegee, Ala., and the construction of a recreation and theater building at the center in Bath, N. Y. The cost of these projects will range between $1,500,000 and $2,000,000. The third project, alterations to four buildings at Dallas, Texas, will cost an estimated $1,500,000.

PERSONNEL

Dr. Donald George Marquis, chairman of the department of psychology at the University of Michigan, and Dr. Howard Wieland Potter, director of psychiatry at Kings County Hospital, have been appointed members of the National Advisory Mental Health Council.... The winner of the American Academy of Neurological Surgery award for 1956 is Lieut. Hubert L. Rosomoff, M. C., U. S. N. R. His paper will be presented at the annual meeting of the American Academy of Neurological Surgery.... Dr. John M. Whitney, director of the health office of the Federal Civil Defense Administration, will be the U. S. delegate to the NATO medical committee that discusses health and medical planning and organization.... Dr. Thomas M. Rivers, newly named medical director of the National Foundation for Infantile Paralysis, has reiterated support for Salk vaccine, stating: "The Salk vaccine is safe, effective and available today. The Sabin vaccine still is in an experimental stage.... *It is impossible to estimate* how long it might take to test and prove the effectiveness of the new vaccine in human beings."

MISCELLANY

Federal agencies have been granted $468,025 for research activities in community air pollution work by the Public Health Service.... The PHS also announces a new program of postdoctoral training in the basic neurological sciences. The program, intended to increase the number of scientists in teaching and research, will be implemented by grants to training institutions. . . . Courses in the latest concepts of civil defense rescue training will be held in late October at the seven regional headquarters of the Federal Civil Defense Administration. The FCDA's rescue program will be presented to small groups of public safety workers who can serve as a nucleus for larger forces in case of an enemy attack. . . . A U. S. Public Health Service survey in 11 western states shows that the demand for dental care will increase more rapidly than the number of practicing dentists. By 1975, it is estimated that 95,000 dentists will be practicing in the U. S. but only 16,000 in the West. . . . New evidence from the heart research laboratories of the PHS indicates that hyperlipemia may result from deficiency of the enzyme lipoprotein lipase. . . . The national consultants to the Air Force surgeon general have held their 10th annual meeting at Wright-Patterson Air Force Base. . . . The AEC, having amended its byproduct material regulation, will permit the possession and use of additional types of low-level radioactive sealed sources. . . . A one-week institute of registrars was held in early October at the Walter Reed Army Medical Center. Registrars and allied medical record personnel discussed the actual and prospective changes in the Army's system of medical records and reports.

(cont'd)

'LANOXIN' continues to offer the same advantages—only the name has been changed.

The full effects of each dose develop quickly to permit rapid appraisal of the need for additional drug. Moreover, the limits of the patient's therapeutic range, which may be reduced in the seriously ill, may be approached with relative safety because toxicity, if it develops, soon abates. For true balance and uniformity of therapeutic effect, prescribe 'LANOXIN' brand Digoxin.

Sincerely,

'B.W.&Co.'

TABLETS: 0.25 mg. (white) and
0.5 mg. (green)

ELIXIR PEDIATRIC: 0.05 mg. in each cc.

MEETINGS

AMERICAN MEDICAL ASSOCIATION: Dr. George F. Lull, 535 North Dearborn St., Chicago 10, Secretary.
1956 Clinical Meeting, Seattle, Nov. 27-30.
1957 Annual Meeting, New York, June 3-7.
1957 Clinical Meeting, Philadelphia, Dec. 3-6.
1958 Annual Meeting, San Francisco, June 23-27.
1958 Clinical Meeting, Minneapolis, Dec. 2-5.
1959 Annual Meeting, Atlantic City, June 8-12.

American Academy for Cerebral Palsy, Congress Hotel, Chicago, Nov. 17-19. Dr. Robert A. Knight, 869 Madison Ave., Memphis 3, Tenn., Secretary.

American Academy of Dental Medicine, Hotel New Yorker, Dec. 2. Dr. George Witkin, 45 South Broadway, Yonkers 2, New York, Secretary.

American Academy of Dermatology and Syphilology, Palmer House, Chicago, Dec. 8-13. Dr. James R. Webster, 55 East Washington St., Chicago 2, Secretary.

American Academy of Neurological Surgery, Camelback Inn, Phoenix, Ariz., Nov. 7-11. Dr. Eben Alexander Jr., Bowman Gray School of Medicine, Winston-Salem, N. C., Secretary.

American Association of Medical Clinics, Mayflower Hotel, Washington, D. C., Oct. 26-28. Dr. Edwin P. Jordan, Box 58, Charlottesville, Va., Executive Director.

American Association of Nursing Homes, Shamrock-Hilton Hotel, Houston, Texas, Oct. 22-25. Mr. Ira O. Wallace, P. O. Box 366, New Castle, Ky., Secretary.

American Cancer Society, Scientific Session, Park Sheraton Hotel, New York, Oct. 29-30. Dr. Charles S. Cameron, 521 West 57th St., New York 19, Medical Director.

American Clinical and Climatological Association, Skytop Lodge, Skytop, Pa., Nov. 1-3. Dr. Marshall N. Fulton, 124 Waterman St., Providence 6, R. I., Secretary.

American College of Cardiology, Interim Session, Webster Hall Hotel and Mellon Institute, Pittsburgh, Nov. 28-30. Dr. Philip Reichert, Empire State Building, New York 1, Secretary.

American College of Chest Physicians, Interim Session, Seattle, Nov. 25-26. Mr. Murray Kornfeld, 112 East Chestnut St., Chicago 11, Executive Director.

American College of Obstetricians and Gynecologists, Palmer House, Chicago, Nov. 7-9. Dr. Paul Hodgkinson, 116 South Michigan Blvd., Chicago 3, Secretary.

American College of Preventive Medicine, Atlantic City, N. J., Nov. 14-15. Dr. John J. Wright, School of Public Health, Univ. of North Carolina, Chapel Hill, N. C., Secretary.

Annual Conference on Electrical Techniques in Medicine and Biology, Governor Clinton Hotel, New York, Nov. 7-9. Mr. E. Dale Trout, General Electric Company, X-Ray Dept., Milwaukee 1, Chairman.

American Fracture Association, Drake Hotel, Chicago, Nov. 29-Dec. 2. Dr. Homer D. Junkin, Paris Hospital, Paris, Illinois, Secretary.

American Heart Association, Music Hall and Netherland-Hilton Hotel, Cincinnati, Oct. 26-Nov. 2. Mr. Rome A. Betts, 44 East 23d St., New York 10, Executive Secretary.

American Public Health Association, The Ambassador, Atlantic City, N. J., Nov. 12-16. Dr. Reginald M. Atwater, 1790 Broadway, New York 19, Executive Secretary.

American School Health Association, Atlantic City, N. J., Nov. 12-18. Dr. A. O. DeWeese, 513 East Main St., Kent, Ohio, Secretary.

American Society for Pharmacology and Experimental Therapeutics, Kentucky Hotel, Louisville, Ky., Oct. 22-25. Dr. Harold Hodge, University of Rochester, Rochester 20, N. Y., Secretary.

American Society for the Study of Arteriosclerosis, Palmer House, Chicago, Nov. 11-12. Dr. O. J. Pollak, P. O. Box 228, Dover, Del., Secretary.

American Society of Tropical Medicine and Hygiene, Jung Hotel, New Orleans, Oct. 31-Nov. 3. Dr. John E. Larsh Jr., Dept. of Parasitology, School of Public Health, University of North Carolina, Chapel Hill, N. C., Secretary.

Annual Conference on Electrical Techniques in Medicine and Biology, Governor Clinton Hotel, New York, Nov. 7-9. Mr. E. Dale Trout, General Electric Company, X-Ray Dept., Milwaukee 1, Chairman.

Association of American Medical Colleges, The Broadmoor, Colorado Springs, Colo., Nov. 12-14. Dr. Dean F. Smiley, 185 N. Wabash Ave., Chicago 1, Secretary.

Association of Life Insurance Medical Directors of America, Hotel Roosevelt, New Orleans, Oct. 23-25. Dr. Henry B. Kirkland, P. O. Box 594, Newark 1, N. J., Secretary.

Association of Military Surgeons of the United States, Hotel Statler, Washington, D. C., Nov. 12-14. Colonel Robert E. Bitner, Room 718, 1726 Eye St., N.W., Washington 6, D. C., Secretary.

Association for Research in Nervous and Mental Diseases, Hotel Roosevelt, New York, Dec. 7-8. Dr. Rollo J. Masselink, 700 West 168th St., New York 32, Secretary.

Association of State and Territorial Health Officers, Hotel Washington, Washington, D. C., Nov. 2-10. Dr. Franklin D. Yoder, State Board of Health, Cheyenne, Wyo., Secretary.

Central Society for Clinical Research, Drake Hotel, Chicago, Nov. 9-10. Dr. Robert H. Ebert, 950 East 59th St., Chicago 37, Secretary.

Congress of Neurological Surgeons, Palmer House, Chicago, Nov. 1-3. Dr. Philip D. Gordy, 1007 Delaware Ave., Wilmington, Del., Secretary.

Eastern Psychiatric Research Association, Waldorf-Astoria Hotel, New York, Oct. 27. Dr. Theodore R. Robie, 676 Park Ave., East Orange, N. J., Secretary.

Gerontological Society, Hotel Hamilton, Chicago, Nov. 8-10. Dr. Nathan W. Shock, Baltimore City Hospitals, Baltimore 24, Secretary.

Interstate Postgraduate Medical Association of North America, Hotel Statler, Cleveland, Oct. 22-26. Mr. Roy T. Ragatz, Box 1109, Madison 1, Wis., Executive Director.

National Society for Crippled Children and Adults, Statler Hotel, Washington, D. C., Oct. 28-Nov. 1. Dr. Dean Roberts, 11 South LaSalle St., Chicago 3, Executive Director.

New England Postgraduate Assembly, Hotel Statler, Botson, Oct. 30-Nov. 1. Dr. Robert P. McCombs, 22 Fenway, Boston 15, Chairman, Program Committee.

Omaha Mid-West Clinical Society, Sheraton-Fontenelle Hotel, Omaha, Oct. 29-Nov. 1. Mrs. Anne K. Ramsey, 1031 Medical Arts Bldg., Omaha 2, Executive Secretary.

Pacific Coast Fertility Society, El Mirador Hotel, Palm Springs, Calif., Nov. 8-11. Dr. Edward T. Tyler, 10911 Wayburn Ave., Los Angeles 24, Secretary.

Pennsylvania, Medical Society of the State of, Chalfonte-Haddon Hall, Atlantic City, N. J., Oct. 21-26. Dr. Harold B. Gardner, 230 State St., Harrisburg, Secretary.

Puerto Rico Medical Association, San Juan, Dec. 4-9. Dr. Rafael Gil, Box 9111, Santurce, Secretary.

Radiological Society of North America, Palmer House, Chicago, Dec. 2-7. Dr. Donald S. Childs, 713 East Genesee St., Syracuse 2, N. Y., Secretary.

PALLIATION OF MAMMARY CARCINOMA WITH PHOSPHORAMIDE DRUGS

Jeanne C. Bateman, M.D.
and
Harry N. Carlton, M.D., Washington, D. C.

• *Where prolonged palliation of mammary carcinoma is indicated, especially with but not limited to extensive disease, and without regard to prior therapy, the phosphoramide drugs may be useful. Medication may be administered by various routes to effect an intratumor application, and also orally to suit the needs of the patient. The ability to use the drug on an outpatient basis, even with extensive disease, provides an economic and psychological advantage to the patient concurrent with the objective response. Hematopoietic depression occurring as a side-effect also serves as a guide in determining dosage.*

A comprehensive survey of cancer statistics reveals an increase in incidence, morbidity, and mortality[1] in spite of improved x-ray techniques, increasingly extensive operative procedures, and education regarding early detection. It appears that the problem of the so-called hopeless case will remain large for some time to come. Because of the frequency of mammary cancer, patients with disseminated metastases secondary to this neoplasm present a challenging problem. Hormone therapy of various types[2] affords objective palliation in approximately 20 to 45% of cases for an average duration of eight to nine months. Unfortunately both androgens and estrogens may be tumor accelerators.[3] The need for other palliative agents is therefore obvious.

Regression of skin metastases after treatment with triethylenethiophosphoramide in patients with disseminated mammary cancer was first reported by Shay.[4] Our early observations[5] confirmed Shay's work and encouraged us to extend our series of patients. The following report concerns 122 cases of far-advanced mammary cancer treated for 1 to 24 months with N, N′, N″-triethylenethiophosphoramide and/or N-(3-oxapentamethylene)-N′, N″-diethylenephosphoramide.

The age distribution of the 122 patients included in this study is given in figure 1. The youngest patient was 26 years old and the oldest was 85. Thirty-eight individuals were in the fifth decade of life; there was progressive diminution in numbers in each subsequent decade.

The interval between diagnosis and institution of chemotherapy ranged from 1 to 14 years. Thirty-six patients were started on phosphoramide therapy less than one year after diagnosis. This group includes five individuals in whom oral chemotherapy was begun postoperatively because of extensive axillary node metastases encountered at the time of mastectomy. Conditions of the other 31 individuals were either out of control with conventional therapy or too far advanced for such. Twenty-five patients were treated one to two years after the initial diagnosis, 20 two to three years, 17 three to four years, 8 four to five years, 6 five to six years, 4 six to seven years, and 3 seven to eight years after diagnosis. Three additional patients had been treated for mammary carcinoma 14 years prior to chemotherapy; however, each of these individuals had had a second mastectomy performed two, five, and six years, respectively, before being referred to us. Although neoplastic disease involving the contralateral breast was a frequent finding in the entire group, the three last-mentioned patients were considered to have had two primary lesions. It is also of interest that, of the 122 patients, 5 had a second remote primary lesion, 3 in the gastrointestinal tract and 2 of the cervix.

Table 1 summarizes previous therapy in this group of cases. Surgery included biopsy only in 22 patients and mastectomy in 100 patients. Eight of the latter group had a second mastectomy, 1 to 14 years following the first. The procedure was classed as simple in 10 instances, radical in the remainder. Surgery was employed for treatment of metastatic disease from one to six times in 32 patients. X-ray therapy was given as the primary form of therapy in 14 patients, postoperatively in 36. One to six courses were administered to 62 patients for metastatic lesions. Thirteen patients were

---

From Garfield Memorial Hospital, George Washington University College of Medicine, Glenn Dale Hospital, and St. Elizabeth's Hospital (Dr. Bateman).

castrated by x-ray, 14 by a surgical procedure. Hormone therapy, including adrenalectomy in 2 patients and large doses of cortisone in 4 patients, had been employed in 70 patients, 58% of the whole group. Other modalities of therapy were radioactive gold (Au^{198}) in three patients, triethylene melamine in one patient, nitrogen mustard in three, and propylthiouracil in one. Conditions of all patients except the five patients treated postoperatively with triethylenethiophosphoramide given orally were considered to be out of control at the time chemotherapy was instituted.

Triethylenethiophosphoramide was given in water solution with 10 mg. of the drug per cubic centimeter; oxapentamethylene in a solution containing 20 mg. per cubic centimeter. The solutions were filtered to achieve sterility. Table 2 summarizes the routes of therapy and the dose schedule for both drugs. A white blood cell count was obtained prior to each dose; hemoglobin determinations and platelet counts were obtained at frequent intervals. The initial dose of the drug depended on the route of therapy. Larger doses were employed for intrapleural, intraperitoneal, and intratumor injections than for other routes. Dosage of oxapentamethylene was usually one and one-half to two times larger than that of triethylenethiophosphoramide. The sudden severe drops in hemoglobin levels and platelet counts, which occurred not infrequently with prolonged therapy with oxapentamethylene, necessitated close observation of the hematological picture while this drug was used.

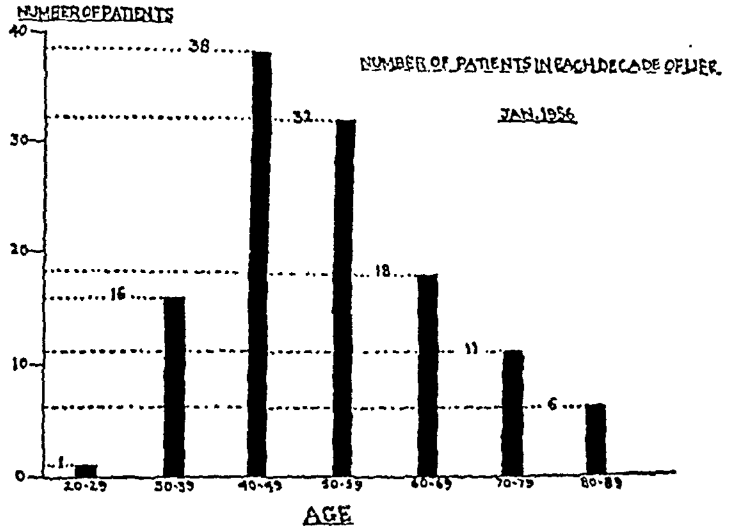

Fig. 1.—Age distribution of the 122 patients with mammary carcinoma.

Whenever possible the phosphoramide was given into a tumor site. The intramuscular route occasionally used early in the study was subsequently abandoned. Oral administration was employed in special situations, as when maintenance therapy was needed during vacation trips or whenever injections by needle were intolerable to the patient, and in the very small group of patients treated postoperatively previously mentioned. In the presence of extensive disease, oral, intramuscular, and sometimes intravenous administration appeared to be inadequate. Intratumor injections were usually preceded by a small dose of local anesthetic.

In therapy with triethylenethiophosphoramide, the total doses administered ranged from 15 to 1,145 mg.; duration of therapy ranged from 1 to 103 weeks. The average dose administered was 336 mg., and the average duration of therapy was 22 weeks. From 5 to 430 mg. of oxapentamethylene were given for periods ranging from 1 to 37 weeks, the average total dose being 139 mg. and the average duration of therapy 7 weeks. There is some overlap between those receiving therapy with triethylenethiophosphoramide and those in whom therapy was oxapentamethylene, since the latter drug had to be substituted for the former during periods of drug shortage. Most of the patients originally started on oxapentamethylene therapy were subsequently shifted to a regimen of triethylenethiophosphoramide when the hematological hazards of the former drug became apparent. After it became apparent that the phosphoramides were palliative and not curative agents, therapy was maintained indefinitely in all cases. Except for short initial, interval, or terminal periods of hospitalization, patients were treated on an ambulatory basis.

TABLE 1.—*Previous Therapy in 122 Patients with Mammary Carcinoma Subsequently Treated with Phosphoramides*

Therapy	Patients, No.	Therapy	Patients, No.
Surgery		Castration	
Biopsy only	22	X-ray	13

TABLE 2.—*Dose Levels in Phosphoramide Therapy in 122 Patients with Mammary Carcinoma**

Route	Dose Level, Mg.		Dose Interval, Wk.
	Triethylenethiophosphoramide	Oxapentamethylene	
Intravenous	5-30	5-40	1-4
Intrapleural	10-40	15-60	1-4
Intraperitoneal	10-40	....	1-4
Intrapericardial	20-25	30	Occasional
Intratumor	3-50	3-80	1-4
Intramuscular	10-20	....	1-4
Oral	5-10	10-20	1-7 days

* White blood cell count was taken prior to each dose and dose reduced if white blood cell count was less than 5,000. Therapy was discontinued if white blood cell count was less than 2,000 with triethylenethiophosphoramide or less than 4,000 with oxapentamethylene.

Observations

Subjective improvement of some degree was noted in the majority of cases. There was improvement in appetite, weight gain, control of dyspnea, cough, pain, and pruritus. Such improvement is difficult to evaluate in chronically ill patients, since it can be achieved at times by such nonspecific measures as good nursing care and sympathetic understanding. Other criteria for judging response to therapy therefore were used.

These included types and duration of objective improvement and survival time. Eighty-one patients manifested some type of objective improvement for periods varying from 1 to 21 months, while 41, or 34% of the patients, showed no objective signs of improvement. Of the 81 with objective responses, 41 showed improvement for 1 to 5 months, 22 for 6 to 10 months, 11 for 11 to 15 months, and 7 for 16 to 21 months.

TABLE 3.—*Objective Response to Phosphoramide Therapy in 122 Patients with Mammary Carcinoma*

Patients, Total No	Type of Lesion	Total Improved No	Total Improved %
20	Ulceration	14	70
7	Tumor of Breast	7	100
44	Metastatic nodules	32	72
11	Metastatic nodes	11	100
10	Inflammatory spread	9	90
3	Facial edema	3	100
36	Hydrothorax	29	80
2	Pericardial effusion	2	100
3	Ascites	2	66
25	Osseous metastases	10	40
11	Pulmonary metastases	5	45
5	Central nervous system involvement	3	60
6	Hepatic metastases	0	0

Duration of improvement averaged 5.4 months in the group of patients who were dead or lost to follow-up and a little more than 8 3 months in the living patients examined. As has been frequently pointed out by others, progression and regression of different lesions can take place simultaneously in the same patients. This makes evaluation quite difficult at times.

Table 3 lists types of lesions and the number of patients in whom improvement was achieved as compared to the number of patients in whom the lesions were seen. Healing of ulceration and partial to complete regression of primary tumors and metastatic nodules and nodes were observed in two-thirds or more of the patients manifesting such lesions. Inflammatory carcinoma was extremely widespread in all but one case, in which it involved the breast only. Injections of phosphoramides resulted in nine cases in decrease or disappearance of pruritus and cessation of spread, if not regression, of the erythematous infiltration so characteristic of this lesion.

Facial edema secondary to large neck nodes in three patients disappeared completely. Recalcification of osseous metastases was achieved by chemotherapy alone in five cases. After it became apparent, however, that this lesion was more quickly controlled by a combination of irradiation and chemotherapy, this type of management was employed. Decrease in size with occasional disappearance of pulmonary metastases was observed in 5 of 11 patients manifesting this complication. It was observed that three to four months of chemotherapy were required to achieve roentgenographic evidence of regression of both pulmonary and osseous lesions

Five patients with signs and symptoms of central nervous system metastases were treated. In two, there was rapid and complete regression of ataxia and weakness of an extremity; in a third there was incomplete regression of visual symptoms. Patients who were started on therapy at a time when massive involvement of the liver was apparent showed no response to therapy and died within a few days or weeks from their disease. There was no way in which to evaluate possible effect of chemotherapy on small metastatic lesions in the liver.

Control of accumulation of serous cavity fluid by local injection of phosphoramide after withdrawal of fluid was achieved in approximately two-thirds of the cases so treated. As previously reported,[5c] it is a simple procedure that requires neither hospitalization nor any special apparatus. Phosphoramide therapy was given in 36 patients with pleural fluid caused by metastatic mammary carcinoma. In 26 no further taps were required for periods of 1 to 21 months after one or more intrapleural injections of drug. Eight of these patients are living. The rate of effusion was slowed in three patients and was unaffected in seven. The last group includes five patients who died within one month after institution of therapy, one patient who had been given Au^{198}, and another who was given mechlorethamine hydrochloride (HN_2) intrapleurally. In 13 patients only one intrapleural injection was required for control, in 6 two were required, in 5 three, in one four, and in one patient eight. The largest number of injections, eight, were given a patient previously treated on two occasions with Au^{198}. Twelve patients developed pleural effusion while receiving phosphoramides by other routes. Intrapleural injections were required to control the effusion.

Results of intrapericardial and intraperitoneal injections of phosphoramides are outlined in table 4. Two patients with pericardial effusion were tapped on one and two occasions respectively. The first patient died two weeks after intrapericardial instillation of oxapentamethylene. At postmortem examination the pericardial sac contained a normal amount of fluid and the serosa was smooth and glistening. The second patient required two taps and injection of triethylenethiophosphoramide one month apart. For the last four months of her life, there was no further accumulation of fluid at this site.

TABLE 4.—*Treatment of Mammary Carcinoma in Six Patients with Pericardial Effusion and Ascites Treated with Phosphoramides*

Condition	Patient	Tap of Fluid Cc	Tap of Fluid No	Triethylene thiophosphoramide, Mg	Oxapentamethylene Mg	Results
				(Intrapericardial)		
Pericardial effusion	1	500			30	Died in 2 wk, no abnormal fluid post mortem
	2	350 450†		20 25†		Controlled 4 mo
				(Intraperitoneal)		
Ascites	3		7 in 3 mo	Injected		Controlled 2½ mo
			3 in 1 mo	Injected		Controlled 2 mo
	4*		Every 2 wk for 7 mo	Injected		Controlled 2 mo
	5		Weekly for 2 mo			Died
	6					Died after 1 wk

* Recurrent ascites of 1 yr duration not controlled by Au^{198}, irradiation, and mercurials

† Interval of 1 mo after preceding course

Response to intraperitoneal injections of phosphoramides for ascites secondary to metastatic mammary carcinoma was less satisfactory. In the first patient listed, control was not achieved until injections were made into some large abdominal masses. The second patient had recurrent ascites in spite of intracavitary administration of Au ^{198}, therapy with mercurials, and x-ray therapy. Control was eventually achieved. Conditions of the third and fourth patients were terminal.

Duration of survival in this series of patients with advanced cancer is given in table 5. Forty-three patients were still alive after 1 to 21 months of follow-up. Seventy-nine patients are listed as having died; this group includes 23 individuals who were lost to follow-up. Of the 43 still alive, over half the patients had been alive for 7 to 21 months after institution of therapy. In spite of the high death rate in the first month of therapy, average survival time in patients who died or were lost to follow-up was six months and median survival time was five months. Average survival time in patients still living was more than eight months and median survival time more than seven months.

Side-Effects of Therapy

Triethylenethiophosphoramide and oxapentamethylene are notable for their lack of clinical side-effects. In this series an occasional patient complained of mild post-treatment nausea. Pain at the site of injection was unpredictable and probably was attributable to mechanical factors. To avoid such pain, a local anesthetic agent was usually employed. The phosphoramide drug was injected with the same needle.

Hematopoietic depression was the one serious side-effect of phosphoramide therapy. It should be pointed out that the patients in this series had, with few exceptions, extremely widespread disease. In such cases, obviously, larger doses of drug were needed to achieve control than might have been required in cancer in earlier stages. Spacing therapy to weekly or longer intervals permitted better evaluation of blood cell counts than when treatment was given more often. The white blood cell count was found to be a valuable guide in determining the dose of triethylenethiophosphoramide. Thrombopenia accompanied leukopenia; our experience it was never at a dangerous level en the white blood cell count exceeded 2,000, in e of occasional minor bleeding episodes. Because white blood cell counts can be performed with ease and accuracy by most technicians, this laboratory procedure was adopted as a guide to therapy. However, frequent complete blood cell counts were found to be necessary when oxapentamethylene was administered for more than two months in a patient.

Adjuvant Therapy

Even when the white blood cell count was lower than 2,000, antibiotics were not given unless the patient showed signs and symptoms of infection. In such cases an attempt was made to administer appropriate therapy promptly and adequately. Transfusions were employed when hemoglobin determinations dropped below 7 to 8 gm. per 100 cc. Red blood cells alone were used in preference to whole blood. Two of the patients in this group died from homologous serum jaundice. Originally chemotherapy alone was used for all lesions. Later supplemental irradiation to osteolytic lesions in long bones and in the vertebrae was employed to help avoid fractures and control pain. Patients with such lesions were kept out of bed, on crutches or with a cane if necessary, in order to avoid decalcification of bones from bed rest.

Chlorpromazine (Thorazine) in small doses was found to be helpful in controlling cough, dyspnea, and apprehension in some of these patients. However, patients with advanced cancer appeared to be unusually susceptible to the sometimes serious hypotensive effects of this drug. The only agents that appeared to aid significantly in protecting the hematopoietic system from the depressant effects of phosphoramide drugs were the adrenal cortical hormones. Of these, cortisone proved most satisfactory. Well-being and appetite were improved. Patients who demonstrated general debility and hematopoietic depression were started on a dose schedule of 25 mg. of cortisone twice a day. This was subsequently reduced, occasionally to as low as 5 mg. twice a day if the patient showed signs of fluid retention. Vitamin C was administered to patients whose dietary intake of citrus fruits was impaired, and B-complex was administered to patients demonstrating overt signs of deficiency. However, because of their possible stimulating effect in experimental tumors, vitamin B_{12} and folic acid were carefully avoided.[6]

Comment

The slow response to phosphoramide drugs is deceptive and may precipitate inadvisable frequency of treatment. This slowness makes the drug useless in moribund patients. If a life span of at least six to eight weeks can be anticipated, a trial of this form of chemotherapy is warranted. Subsequent to maximum improvement as manifested by no further regression of disease, therapy probably should be continued on a maintenance basis to avoid relapse. Such maintenance therapy can be achieved by administration of the drug at two-to-three-week intervals. Because of considerable range in sensitivity of tumors to these agents, each case must be handled somewhat individually.

It is of interest that age and type of previous therapy seemed not to influence response in any particular direction in this series. Patients previously treated with female or male hormones or adrenalectomy showed varying degrees of response. The fact that the two adrenalectomized patients were somewhat depressed after injection of the phosphoramide and that one required an increase in dosage of cortisone on the day of therapy suggested that the nonspecific stimulating effect of the phosphoramides may be mediated through the adrenals.

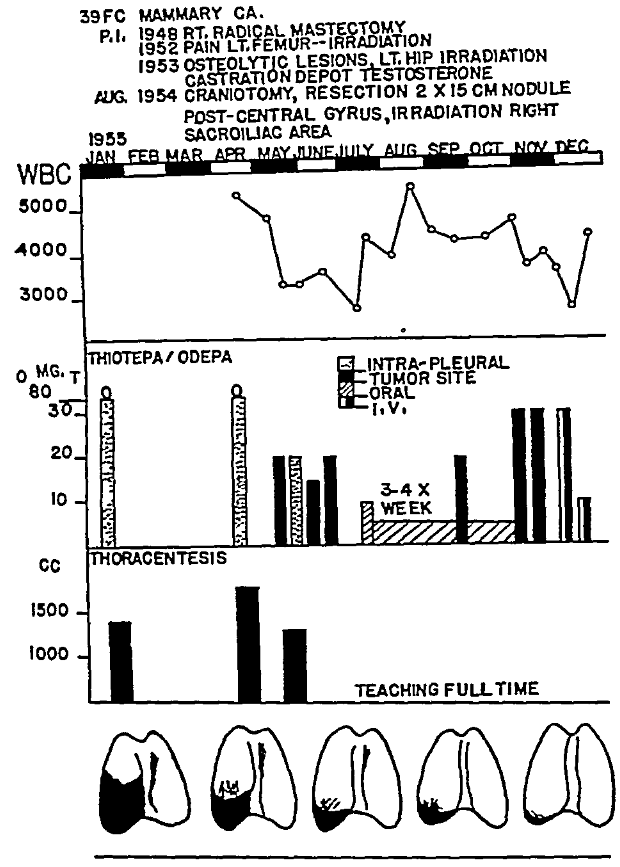

Fig 2.—Laboratory data on patient (case 1) with pleural effusion treated with oxapentamethylene initially and then with triethylenethiophosphoramide.

Enough data are not available to substantiate an impression that prolonged therapy with the phosphoramides will have a castrating effect. There is evidence, however, that suggests such an effect occurs. Two patients purportedly castrated by irradiation a substantial period prior to initiation of chemotherapy developed marked vasomotor and psychic menopausal-type symptoms after several months of therapy. One 23-year-old female treated for a primary spinal cord tumor and therefore not included in this series developed signs and symptoms of menopause after receiving triethylenethiophosphoramide by the intravenous route for 12 months.

Skin changes somewhat resembling late irradiation pigmentation were observed. They were limited to epidermis overlying tumor infiltrates. A buffy or brownish coloring was characteristic. Epilation such as was seen following regional intra-arterial injections of mechlorethamine[7] was not observed. On the other hand, beginning new hair growth at the site of a large, smooth scalp nodule treated by local injections of triethylenethiophosphoramide occurred in one patient. Just as tumor response could not be correlated with age or previous therapy, neither could it not be correlated with cell type. Nor is an explanation apparent why some mammary tumors failed to respond. Dense fibrous tumors appeared to regress appreciably more slowly than did very vascular tumors. More study is needed on this point.

Triethylenethiophosphoramide is much preferable to oxapentamethylene for prolonged therapy. The latter drug is an effective and useful agent for short periods of therapy, but periods extending to two to three months may be attended by a sudden severe anemia and thrombopenia. Triethylenethiophosphoramide is a valuable agent because of ease of administration and lack of clinical toxicity. Accumulation of fluid can be cared for and treated in a clinic or office. Conditions of patients with extensive disease can be maintained on an outpatient basis, which is not only an economic but also a psychological advantage.

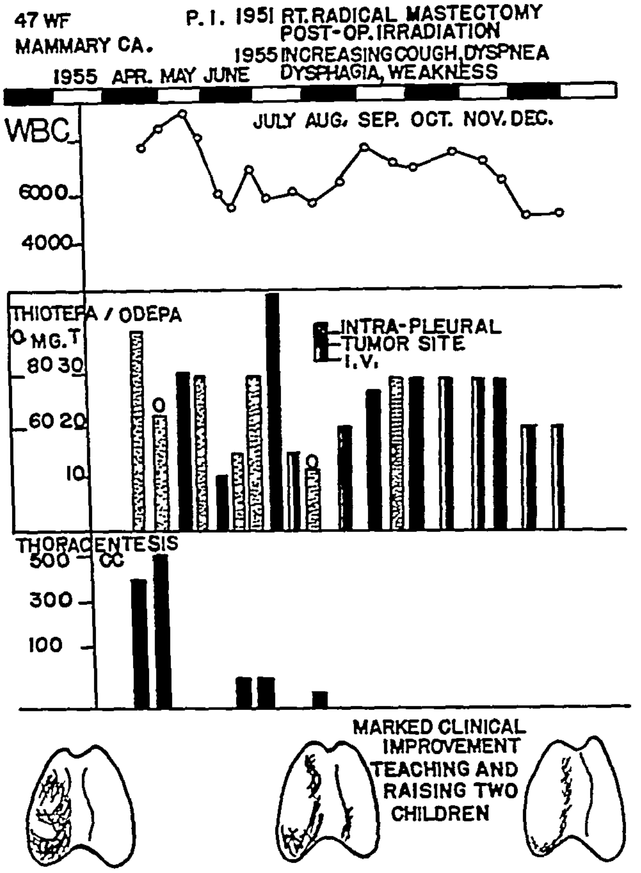

Fig. 3.—Laboratory data on patient (case 2) with pleural effusion treated with triethylenethiophosphoramide.

Report of Cases

Case 1.—A 39-year-old woman (fig. 2) had a radical mastectomy in 1948, received irradiation for osseous metastases in 1952, was castrated by irradiation and was given testosterone for recurrent osseous metastases in 1953, and had a craniotomy for a cerebral metastasis and another course of irradiation to the hip in August, 1954. In January, 1955, she developed progressive dyspnea due to pleural effusion. One tap followed by injection of 80 mg. of oxapentamethylene controlled the effusion for three months. Thoracentesis with injection of the drug was done two more times in the following two months. Subsequently intravenously given or locally injected triethylenethiophosphoramide was administered for maintenance at one-week to four-week intervals, except for a short period of oral administration of the drug. There was no further accumulation of pleural fluid. Thirteen months after the first tap, the patient was asymptomatic except for mild postcraniotomy clumsiness of the right hand and was teaching school full time.

Case 2.—A 47-year-old woman (fig. 3) had a radical mastectomy in 1951 followed by postoperative irradiation. She was dyspneic, weak, and apprehensive when first seen in April, 1955. Several chest taps were performed, and triethylenethiophosphoramide was instilled into the pleural space. Only a few cubic centimeters of fluid were obtained after the first two taps. Triethylenethiophosphoramide was subsequently administered intravenously or into a thickened area in the left supraclavicular region at one-week to three-week intervals. The pulmonary lesion had largely cleared and accumulation of pleural fluid was controlled 10 months after institution of therapy. The patient was not only teaching school but keeping house for her husband and two children.

Case 3.—A 49-year-old female (fig. 4) had had a radical mastectomy on the left in 1949, followed by yearly recurrences treated surgically or by irradiation. When she was seen in March, 1954, there were two large masses on the left anterior chest wall and rapidly recurring bloody pleural effusion containing cancer cells. The patient was treated with one intrapleural and three intratumor injections of triethylenethiophosphoramide during the following month. She was then lost to follow-up and was not seen again for 21 months. During this time the lesions apparently completely regressed. A small recurrent tumor on the left anterior chest wall (fig. 4B) in an area of marked telangiectasia and recurrent dyspnea caused the patient to return for more therapy. Again bloody fluid was obtained from the left pleural space. Triethylenethiophosphoramide was injected on two occasions (50 mg. and 40 mg. one week apart). The skin lesion was subsequently injected with 10 and 15 mg. at two-week intervals. Two months after the beginning of this second course of therapy, the chest was clear and the skin nodule had disappeared.

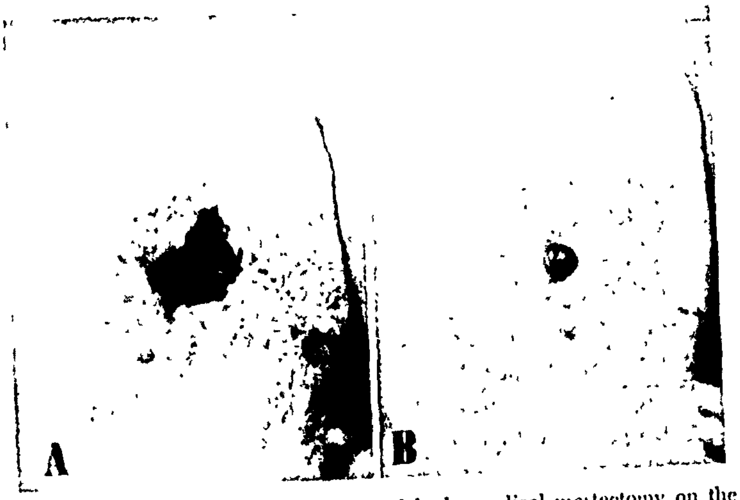

Fig. 4.—*A*, patient (case 3) who had had a radical mastectomy on the left and who had recurrences. Two large masses were on the left anterior chest wall, and there were rapidly recurring bloody pleural effusions. Patient was treated with triethylenethiophosphoramide for one month. *B*, when patient was next seen, after 21 months, lesions had completely regressed, although patient had small recurrent tumor on left anterior chest wall, recurrent dyspnea, and pleural effusion.

Summary and Conclusions

A total of 122 patients with mammary carcinoma were treated with N, N′, N″-triethylenethiophosphoramide and/or N-(3-oxapentamethylene)-N′, N″-diethylenephosphoramide for periods ranging from 1 to 24 months. Of these, 117 patients had extensive primary or recurrent disease. Five patients received oral chemotherapy after a radical mastectomy that revealed multiple metastatic axillary nodes. Chemotherapy was administered by intramuscular, intravenous, intrapleural, intraperitoneal, intrapericardial, intratumor, and oral routes. Except with the last-mentioned route, therapy was given with few exceptions at one-week to three-week intervals on outpatient basis.

Prior treatment in this group included surgery, irradiation, and use of various types of hormones. Type of previous therapy did not seem to alter response to chemotherapy significantly. Responses to phosphoramides included healing of ulceration, regression of soft tissue masses, control of serous cavity effusions, recalcification of bone lesions, and control of signs and symptoms of central nervous system metastases. The phosphoramides are useful agents in the prolonged palliation of advanced mammary carcinoma. Because of a more predictable hematological response, triethylenethiophosphoramide is preferable to oxapentamethylene.

1816 R St. N. W. (9) (Dr. Bateman).

This study was aided by a grant from the Lederle Laboratories Division of the American Cyanamid Company, Pearl River, N. Y., which also supplied the N, N′, N″-triethylenethiophosphoramide and the N-(3-oxapentamethylene)-N′, N″-diethylenephosphoramide.

Cervical Carcinoma.—The finding of two types of carcinoma, an epidermoid carcinoma, and an adenocarcinoma, comes as no surprise in an organ such as the cervix, which has both squamous and columnar epithelium. It is natural to conclude that epidermoid carcinoma would arise from the stratified squamous epithelium of the exocervix and that adenocarcinoma would arise from the columnar epithelium of the endocervix. There is evidence which seemingly strongly corroborates this viewpoint. For many centuries cervical carcinomas have been known to involve that portion of the cervix which could be seen or felt with ease—the exocervix. In recent years the recognition of intraepithelial carcinoma and the various grades of basal-cell hyperplasias of the squamous epithelium has provided the apparently intermediate stages between normal squamous epithelium and epidermoid carcinoma. This has resulted in widespread acceptance of this mode of origin of epidermoid carcinoma of the cervix. Despite this, however, a number of investigators have implicated an additional source of origin of epidermoid carcinoma of the cervix in the endocervical epithelium, either in the subcylindrical basal cells or in metaplastic cells.—M. Marsh, M.D., Original Site of Cervical Carcinoma, *Obstetrics and Gynecology*, April, 1956.

TUMORS OF THE SPINAL CORD

OCCURRENCE IN PATIENTS WITH PERNICIOUS ANEMIA AND SUBACUTE COMBINED SCLEROSIS

David G. Hanlon, M.D., Henry W. Dodge Jr., M.D., Robert G. Siekert, M.D.
and
Frances E. Bull, M.D., Rochester, Minn.

The neurological changes that may accompany pernicious anemia are well known. The lesions usually develop in both the posterior and lateral columns of the spinal cord. In addition, definite alterations may be observed in the peripheral nerves, and in a few instances cerebral involvement with mental symptoms occurs.

Most physicians experienced in the care of patients afflicted with pernicious anemia hold that both the hematological and neurological manifestations of the disease can be treated effectively with adequate amounts of either a potent liver extract or cyanocobalamin, if these preparations are given intramuscularly. Common experience also indicates that the progress of the neurological symptoms that result from alterations in the spinal cord can be arrested in most, if not all, patients by such optimal parenteral therapy. Varying degrees of recovery from the neurological manifestations will occur with adequate treatment, although complete recovery may not follow when irreversible damage to the spinal cord has already taken place. The degree of improvement that will follow adequate treatment is inversely related to the length of time that the neurological abnormalities have been present rather than to the severity of the neurological abnormalities existing at the time treatment is first instituted. The greatest improvement in the neurological signs usually occurs between the third and sixth months after the start of appropriate therapy, and maximal improvement almost always will occur within one year. The usefulness of supplementary physical therapy and coordinated muscle-training exercises has been observed repeatedly.

Up to the present time we have not observed progression of the signs of subacute combined sclerosis in patients who have received adequate maintenance treatment for pernicious anemia. The regular administration by the intramuscular route of either a potent liver extract or cyanocobalamin in adequate dosage has seemed virtually a guarantee against further progression of the neurological symptoms. However, we recently observed two patients with pernicious anemia who showed initial improvement and later progression in their neurological difficulties, although they were following adequate maintenance programs. The results of the neurological examinations suggested the presence of focal lesions in the spinal cord. Both patients had tumors of the spinal canal. These cases are being reported because they illustrate certain problems in the diagnosis and management of patients who had pernicious anemia with subacute combined sclerosis and tumors of the spinal cord.

• *The diagnosis of pernicious anemia with dorsolateral spinal degeneration was made in two patients, and the progress of the neurological symptoms was halted by treatment with cyanocobalamin. Both patients, however, suffered exacerbations of these symptoms after a lapse of time, which was 13 months in one case and six years in the other. Neither responded to intensified medical treatment. In the first case, an extramedullary, intradural psammomatous meningioma at the 10th thoracic level was found at operation, and removal of the tumor was followed by marked improvement. In the second case, the lesion proved to be an extradural neurofibroma. In both, the initial diagnosis of pernicious anemia was corroborated by a test depending on the absorption of cyanocobalamin labeled with radioactive cobalt. These experiences illustrated the usefulness of the cyanocobalamin-absorption test, the response of patients with pernicious anemia to cyanocobalamin therapy, and the possibility that two unrelated causes of neurological symptoms may coexist in a single patient.*

Report of Cases

Case 1.—A 65-year-old woman was first examined at the Mayo Clinic in September, 1955; her chief complaint was increasing difficulty in walking. She always had enjoyed good health until the summer of 1953, when she first noticed gradually increasing unsteadiness in gait and numbness of the legs. She soon began to stagger and to fall easily when walking alone. Simultaneously she had upper abdominal fulness and bloating and soreness of her tongue. The diagnosis of pernicious anemia was made at that time.

Histamine-resistant achlorhydria was present, and examination of a peripheral blood smear revealed the morphological features of pernicious anemia. Therapy with parenterally given cyanocobalamin was begun, and the patient received 1,000 mcg. daily for one week, then twice a week for a few weeks; subsequently she followed a continuous maintenance program of cyanocobalamin given intramuscularly twice a month. Within two weeks after treatment was started, she could walk normally without assistance and the soreness of her tongue had disappeared. The patient remained well until about November, 1954. At that time numbness, which she believed was more noticeable in the left leg, developed in her legs and gradually became worse. Soon thereafter the legs became weak, and within a short period she again needed support while walking. She also had to watch her feet to be certain where they were. Abdominal bloating reappeared, but soreness of the tongue did not.

In January, 1955, the dosage of cyanocobalamin was increased to 1,000 mcg. intramuscularly two times a week. In spite of this, the neurological symptoms worsened. In May, 1955, 500 units of crude liver extract every other day was prescribed in addition to an increased amount of cyanocobalamin given parenterally. The neurological symptoms continued to increase. About this time intermittent vesical and rectal incontinence developed. Physical examination on admission to the clinic revealed normal findings except for the neurological abnormalities. Her gait was broad based, ataxic, and spastic to such a degree that she could walk only when aided. The unsteadiness was present on standing and

---

From the Mayo Clinic (Drs. Hanlon, Dodge, and Siekert) and the Mayo Foundation, Graduate School, University of Minnesota (Drs. Hanlon, Dodge, Siekert, and Bull).

was worse when her eyes were closed (positive Romberg's sign). Muscular reflexes were slightly overactive and equal in the upper limbs, markedly enhanced at the knees, where the left was more active, and absent at the ankles. Extensor plantar reflexes were present bilaterally and were more marked on the left. The epigastric skin reflex was normal on the right and depressed on the left. The midabdominal, hypogastric, and anal skin reflexes were absent bilaterally. Tests for coordination and diadochokinesia were well performed in the upper limbs. A sensory type of ataxia was seen on heel-to-knee tests, and alternate motion rate was slowed at the ankles. Slight weakness of the muscles of the lower extremities was observed, more apparent distally, and more on the left. The tone of the anal sphincter was decreased.

Vibratory sensibility was absent at ankles and knees and at the left iliac crest and was decreased though present at the right iliac crest. Joint sensibility was absent at the toes and depressed at both ankles, but more so on the left. Light touch sensibility was minimally decreased in the lower limbs, particularly over the feet; the decrease was greater on the left than on the right; a sensory level was noted at the 11th thoracic dermatome on the left and at the 3rd lumbar on the right. Pain and thermal sensibilities were markedly depressed on the right side below the level of the 12th thoracic dermatome posteriorly and the 10th thoracic anteriorly and only slightly depressed on the left below the level of the 5th lumbar dermatome posteriorly and the inguinal ligament anteriorly.

Clinically there could have been made a neurological diagnosis of combined sclerosis with peripheral neuritis, but submerged and altered by an incomplete Brown-Séquard type of lesion at the level of the 10th thoracic segment of the spinal cord on the left.

Urinalysis yielded normal results. The value for hemoglobin was 13.5 gm. per 100 ml. of blood; the erythrocyte count was 4,720,000 and the leukocyte count 4,200 per cubic millimeter. The sedimentation rate of erythrocytes was 13 mm. in one hour (Westergren method), and a serologic test for syphilis gave negative results. The peripheral blood showed no morphological evidence of pernicious anemia. The value for urea was recorded as 30 mg. per 100 ml. of blood. Histamine-refractory achlorhydria was present. The roentgenogram of the thorax showed thickened pleura in the left costophrenic angle. A roentgenogram of the stomach showed normal conditions. Roentgenograms of the spinal column revealed a narrowed sixth cervical interspace and mild generalized osteoporosis.

A cyanocobalamin-absorption test was done utilizing the Schilling[1] technique of oral administration of 0.5 mcg. of cyanocobalamin labeled with radioactive cobalt (Co^{60}) followed in two hours by the parenteral injection of 1,000 mcg. of inert cyanocobalamin and then by measurement of the radioactivity of the subsequent 24-hour specimen of urine. The 24-hour specimen of urine contained the equivalent of 3.4% of the oral dose (range in pernicious anemia, 0 to 3.5%). Repetition of the test dose with gastric juice as a source of intrinsic factor resulted in the excretion of 16.4% of the oral dose (normal range, 8.5 to 38%). The clinical impression of pernicious anemia, therefore, was confirmed.

Examination of the cerebrospinal fluid revealed 45 mg. of protein per 100 ml. of fluid, and myelography with iophendylate injection (Pantopaque) demonstrated partial obstruction to the cephalad flow of iophendylate at the level between the 9th and 10th thoracic vertebrae. Laminectomy was performed, and at the level of the 10th thoracic segment the spinal cord was found to be markedly compressed, severely thinned, and pushed posteriorly and to the right by an extramedullary, intradural tumor. The tumor was attached in the region of the dentate ligament on the left side and was about the size of a small plum. Microscopically, it proved to be a psammomatous meningioma.

The patient convalesced well. A maintenance program of 30 mcg. of cynanocobalamin a week given parenterally was recommended. The patient also was instructed in a program of physical therapy. The patient was reexamined in January, 1956. She stated that in all ways she had made excellent progress. Muscle strength in her legs had steadily improved, and three weeks prior to this examination she was able to walk without the aid of a walker. Her sense of balance was better, and subjectively the sensation in her legs was nearly normal. Vesical and rectal sphincters functioned normally.

Objectively the central nervous system was much improved. A moderate amount of ataxia and spasticity was seen in the gait, but she walked easily without aid. Slight Rombergism was noted. The quadriceps reflexes were increased slightly on both sides, although more on the left. The left plantar reflex was equivocally extensor. No muscular weakness was noted in the right lower limb and only a slight amount in the left. Vibratory sensibility was as before operation. Position sense was now normal at the ankles, only moderately depressed on the right toe and still absent in the left toe. Slight hypesthesia was present over the feet. Pain and thermal sensibilities were moderately decreased on both feet but more on the right. Alternate motion rate of the left foot was slowed. Tone of the anal sphincter was normal.

Case 2.—A 58-year-old woman was first examined at the clinic in June, 1955. She had always enjoyed good health until 1949, when anorexia, easy fatigability, numbness and tingling in the fingers of both hands, and weakness of the right leg developed. A diagnosis of pernicious anemia was made in 1949. Erythrocytes then numbered 2,300,000, and gastric achlorhydria was noted. Large amounts of cyanocobalamin and liver extract were given parenterally; within two months the erythrocyte level had risen to 4,800,000 and the numbness and weakness had disappeared. A maintenance dosage of 1 cc. of cyanocobalamin and 1 cc. of liver extract every three weeks was recommended. The patient followed this program faithfully.

In 1951 the patient first became aware of dull pain and muscle cramping over the right scapular area. This occurred intermittently, was usually worse on arising, was aggravated by coughing, sneezing, and straining at stool, and could always be relieved by aspirin. Phenylbutazone (Butazolodin) and cortisone had been administered for these symptoms in the fall of 1952. She continued to have intermittent aching in the right scapular region until admission, although it never was incapacitating and actually caused her little concern.

In January, 1955, after an emotional upset, the peculiar sensations in her legs returned, and her husband noticed that her gait was unsteady at times. In March, 1955, she awakened one morning unable to use her legs satisfactorily, and the numbness, which had been present only in her feet and legs, now extended to the waist. Her gait was unsteady. The dosage of cyanocobalamin was increased, and vitamin B complex was given intravenously. Over the next two or three weeks the numbness lessened, but her legs still felt stiff and her gait remained ataxic.

General physical examination on admission to the clinic revealed normal findings. Neurological examination disclosed a markedly spastic gait, sensory ataxia of the lower limbs, and Rombergism. The patient could not stand or hop on either foot. Muscular reflexes were overactive in the lower limbs, and extensor plantar reflexes were seen bilaterally. No clear-cut muscular weakness could be demonstrated. Abdominal reflexes were absent. Joint and vibratory sensibilities were depressed in the toes and ankles, more so on the right. Rectal tone was normal. Superficial sensation was subjectively depressed in the lower limbs, but this could not be clearly demonstrated objectively. Neurologically, it was felt that subacute combined sclerosis of the cord could have been present in 1949. The recent myelopathy with sudden exacerbation five months before admission and with marked spasticity was considered to be the result of a mass in the upper thoracic portion of the spinal canal.

Urinalysis yielded normal results. The erythrocyte count was 4,670,000, the leukocyte count 6,300, and the value for hemoglobin 12.6 gm. The serologic test was negative for syphilis. The peripheral blood showed no morphological features of pernicious anemia. Histamine-refractory achlorhydria was present. An electrocardiogram showed normal conditions. Roentgenogram of the chest was negative; roentgenogram of the spinal column revealed mild diffuse osteoporosis and minimal hypertrophic changes at the lower cervical and midthoracic levels.

A cyanocobalamin-absorption test, with the same technique used as in the preceding case, revealed urinary excretion of 0.5% of the oral dose of radioactive cyanocobalamin. Repetition of the test, using intrinsic factor with the oral dose, resulted in excretion of 9.5% of the oral dose. The clinical impression of pernicious anemia, therefore, was confirmed.

Observations at lumbar puncture revealed evidence of a partial block. The cerebrospinal fluid removed contained 1,058 mg. of protein per 100 ml. Myelography with iophendylate injection disclosed an obstruction to the cephalad flow of mediums at the level of the third thoracic vertebra. Laminectomy was performed, and a large extradural neurofibroma was removed.

Comment

These cases were of interest to us because two diverse etiological mechanisms could be responsible for the neurological findings. Historically, at least, the original neurological difficulties in both patients appeared to be the result of pernicious anemia. Their prompt disappearance with appropriate therapy certainly supports this contention.

However, since it is unusual for the neurological status of a patient to worsen while he is following an adequate maintenance program of therapy with parenterally given cyanocobalamin or liver, it seemed likely that some cause other than pernicious anemia must be responsible for the recurrent neurological symptoms and findings. This was further suggested in case 1 by the neurological examination, which disclosed evidence of an incomplete Brown-Séquard syndrome. This syndrome may be observed in cases in which lesions are compressing the spinal cord. A meningioma was removed at operation. In case 2 the clinical course with rather sudden reappearance of numbness and poor use of the legs, with marked spasticity in the legs, and root pain suggested a rootlet mass lesion pressing on the spinal cord. An elevated value for protein in the spinal fluid was found. At exploration a neurofibroma was discovered.

Tests with cyanocobalamin labeled with Co ^{60} helped confirm the existence of pernicious anemia, since without this test only a presumptive diagnosis would have been warranted. This test is helpful to the clinician in establishing a diagnosis of pernicious anemia at a time when the disease is in remission because it has been modified by previous parenteral therapy with either cyanocobalamin or liver extract. In our opinion, in addition to careful neurological examination, study of the spinal fluid and often myelography should be considered in all cases of pernicious anemia when progression of the neurological dysfunction is evident in the face of adequate parenteral therapy with cyanocobalamin or liver extract.

Summary

In two reported cases pernicious anemia and tumors of the spinal cord coexisted. In both, the history was compatible with a diagnosis of subacute combined sclerosis of the cord with improvement on adequate therapy. It is emphasized that the progress of subacute combined degeneration in pernicious anemia can be arrested in every case by adequate parenteral therapy with either cyanocobalamin or a potent liver extract.

If, in spite of an adequate maintenance program with these agents, the number and severity of the neurological symptoms or signs increase, or if the neurological symptoms recur after initial improvement in spite of continuous adequate therapy, some cause other than pernicious anemia should be suspected. Neurological and neurosurgical consultation should be obtained in all such cases and appropriate studies should be carried out. The test with radioactive cobalt–labeled cyanocobalamin is useful in confirming the diagnosis of pernicious anemia in cases in remission due to previous parenteral therapy with liver extract or cyanocobalamin.

FOLLOW-UP REPORT ON RESECTION OF THE ANGINAL PATHWAY IN THIRTY-THREE PATIENTS

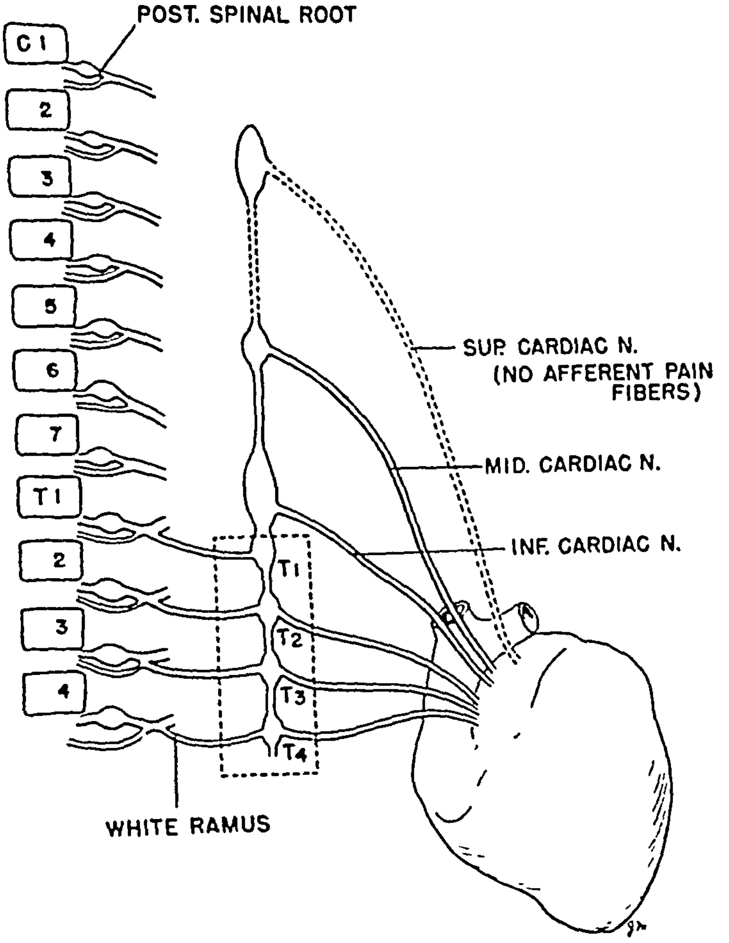
Clem F. Burnett Jr., M.D.
and
James A. Evans, M.D., Boston

• *The results of surgical treatment were studied in 33 patients who had angina with or without hypertension. The cases were severe and included four with angina decubitus and one with status anginosus preoperatively. The operations, designed to interrupt the nervous pathways transmitting the pain, consisted of unilateral or bilateral sympathectomies at various levels from the third lumbar to the inferior cervical ganglion. There were three operative deaths; six additional deaths occurred during the ensuing 16 to 84 months of observation. The tabulated details of these cases show a wide variety of responses, some dramatic, some definite but temporary. Occasionally the unilateral operation gave relief; in one patient, the unilateral operation did not give relief but the subsequent contralateral resection did. Of the 30 patients who survived the operation, 18 had complete relief from anginal pain for one to 11 years.*

In spite of recent advances in medical science, angina pectoris remains one of the serious problems for the cardiologist. Use of glyceryl trinitrate (nitroglycerin) offers relief for the patient with moderate angina of effort, but in some patients there seems to be an overalarm mechanism (that is, the provocation of pain is out of proportion to the need for protection of the heart), producing severe anginal pain on the slightest effort or during rest. One such patient was unable to turn over in bed or feed herself without severe angina. In a search for a method to help these unfortunate patients, various surgical procedures have been devised. This communication will deal with only one of these procedures, resection of the anginal pathway, the first to the fourth thoracic ganglions on both sides (see figure).

From the Lahey Clinic. Dr. Burnett is now in Mayfield, Ky.

In 1953, Evans and Poppen [1] followed a procedure for resection of the anginal pathway, advocated and best described by White,[2] and reported on 16 patients who were treated in this manner. We now have further follow-up studies on these patients and have added 17 new patients to the series. Table 1 records the results of the operation in each case. The first 16 patients constituted Evans and Poppen's original series. Sixteen of the 33 patients were operated on for hypertension with angina; the remaining 17 were operated on primarily for intractable angina. There were three operative deaths in the entire series, or an operative mortality of 9%; one of these deaths occurred on induction of anesthesia.



The cardiac afferent pain pathway. Note how the anginal pathway is funneled through the first, second, third, and fourth thoracic ganglions

Six patients who survived the immediate postoperative period have since died, 16 months to seven years after operation. The patient in case 1 (see table 1), whose left anginal pathway only was resected, continued to have angina in her right arm until her death three years after operation. The patient in case 2 died of congestive failure five years after operation. She had had no recurrence of angina during these years. The patient in case 6 remained virtually free of pain for three years after operation and then died of a cerebrovascular accident. The patient in case 16 had been free of pain for about one year, when pain characteristic of a myocardial infarction developed, but his electrocardiogram revealed no change. A Beck operation was performed elsewhere, and he died after operation. The patient in case 25 died of an unknown cause after five years of freedom from anginal pain after operation. The patient in case 27, with hypertension, died of a cerebrovascular accident. She never had had freedom from anginal pain for the seven years that she lived after operation. She was a patient operated on early in the series, however, who in 1944 had had only the left first and second thoracic ganglions resected.

Of the 24 surviving patients, 14 (58.3%) have had no anginal pain, 7 (29.2%) have had occasional discomfort on exertion, and 3 (12.5%) have continued to have severe anginal pain. The follow-up period on these living patients is 1 to 11 years. The percentage of good results among those living (87.5%) remains about the same as when those who have died are included—26 (86.6%) of the series of 30 obtained adequate relief for 1 to 11 years, whether or not they later died. Of all 30, 18 (60%) obtained complete relief, while 8 (26.6%) experienced mild exertional discomfort. Two patients obtained adequate relief, one completely so until an infarction occurred, when anginal pain on effort returned. Four patients (13.3%) experienced no relief.

Of the 30 patients who survived operation, 10, or 77% of the 13 patients without hypertension, were relieved of pain, while 16, or 94% of the 17 with associated hypertension, obtained relief. Preexisting myocardial infarction was noted in five patients, and four, or 80% of them, obtained fair to complete relief of angina. Four patients with severe angina decubitus had remarkable relief and were restored to reasonable activity (cases 5, 18, 22 and 29).

An attempt was made to account for failure of the surgical procedure to relieve pain in some of the patients (table 2). In the first patient in the series, the anginal pathway was not resected on the right side, and pain persisted only on that side. The necessity for resecting both sides, as borne out in this patient, is again emphasized. This was also noted in the patient in case 7, who obtained no relief from the first procedure when the first, second, and third thoracic ganglions were not resected on the right. This patient was again operated on six years later, and the remaining right anginal pathway was resected, with complete relief. Another patient (case 17) had a resection of the right side only, for pain in the right chest and shoulder, temporary relief having been obtained by procaine block of the first through the fourth thoracic ganglions. He now has pain occasionally in the left shoulder, which is relieved by glyceryl trinitrate. It was noted, however, that three patients (cases 5, 9 and 10) had little or no angina, although the complete pathway was not resected on the right side. Inadequate resection of the left side only (first and second thoracic ganglions) resulted in no relief in the patient in case 27, the patient operated on early in the series and mentioned above.

The patient in case 12 had an adequate resection of the anginal pathway and was relieved of pain for four months. She then had a myocardial infarction, and after this severe angina decubitus developed. A sweat test showed sympathetic activity, indicating regrowth of sympathetic fibers. The patient in case 16 had a similar experience, pain being relieved for about a year, when he probably had a myocardial infarction, followed by recurrence of angina.

Patients in whom the emotional component predominated did not obtain much relief from surgical intervention. The patient in case 20 had a severe emotional overlay and was subject to frequent asthmatic attacks. She described her postoperative attacks as mild and occurring only two or three times a week. Before operation she had had anginal attacks while dressing or cooking In spite of the apparent difference in her symptoms, she repeatedly wrote letters to us stating that she was no better. The patient in case 23 had atypical pain, but it was dramatically relieved by sympathetic block. She was operated on, although there was considerable apprehension about the outcome. Temporary relief was obtained, but she noted a gradual return of the pain, and severe angina decubitus developed. A "talc" operation was performed else-

TABLE 1.—*Results of Resection of Anginal Pathway in Thirty-Three Patients with Angina Pectoris*

			Ganglionic Level of Sympathectomy			
Case	Age and Sex	Preoperative Status	Left	Right	Follow Up Period, Yr	Result
1	42 F	Grade 3 hypertension; angina	T 2 to L 2, 8/20/46	T-6 to L 2 9/3/46	3	Died, coronary occlusion; had angina in right arm until death
2	46 F	Grade 2 hypertension; angina	T-1 to L-2 1/8/47	T-3 to L 3, 1/20/47	5	Angina relieved; died 1/19/52 congestive failure
3	47 F	Grade 2 hypertension; angina	T-2 to L 2, 4/5/47	T-2 to L 2, 4/14/47	7½	Occasional exertional pain, but glyceryl trinitrate not used
4	42 M	Grade 3 hypertension; angina	T-2 to L 2, 4/12/47	T-2 to L 2, 4/21/47	7½	No angina; had cerebrovascular accident with partial recovery; fundi 2; blood pressure 210/100 mm Hg
5	49 F	Grade 3 hypertension; diabetes mellitus, angina decubitus; unable to feed self in bed	T-1 to L 2, 12/1/47	T-4 to L 2, 12/11/47	2	No pain; no use of glyceryl trinitrate; blood pressure 140/100 mm Hg
6	42 M	Grade 2 hypertension, angina	T-7 to L 2, 1943; T-1 to T-12, 2/12/48	T-7 to L 2, 1943; T-1 to T-6, 2/26/48	3	Died of cerebrovascular accident 2/18/51; rare anginal pain in throat after resection of anginal pathway in 1948 until death (glyceryl trinitrate three times in 7 mo)
7	50 F	Grade 2 hypertension; old myocardial infarct; angina, obesity	T 2 to L 2, 8/21/48; T 1 to T 4, 9/24/54	T-4 to L 2, 8/30/48; T-1 to T-4, 9/24/54	6½ 1¼	Little relief from first procedure; complete relief from second; much postural hypotension; recent nonfatal coronary infarct
8	54 F	Grade 3 hypertension; angina, severe postprandial	T 1 to L-2, 10/27/48	T-1 to L 2, 11/8/48	7	No angina; two cerebrovascular accidents, in 1952 and 1955; nonfatal coronary infarct in 1956
9	45 M	Grade 2 hypertension; Dupuytren's contracture; angina	T 3 to L-3, 7/5/49	T-3 to L 2 7/14/49	5	No angina; blood pressure 140/90 mm Hg; contracture improved
10	44 F	Grade 3 hypertension; angina; cardiac enlargement, left ventricular strain	T-1 to L-2, 9/25/49	T-4 to L 2, 9/28/49	5½	Blood pressure 120/76 mm Hg; no chest pain except when walking rapidly uphill; rarely takes glyceryl trinitrate
11	46 M	Grade 2 hypertension; angina of effort and emotion, psoriasis	T 1 to T 12, June, 1950	T-1 to T 12, June, 1950	4½	No angina; Master's test negative; blood pressure 135/85 mm Hg
12	54 F	Grade 2 hypertension, angina 4 yr, 10 glyceryl trinitrate tablets per day; diabetes	T 1 to T-12, September, 1950	T-1 to T 12, September, 1950	4	Relieved about 4 mo, then had myocardial infarct with severe angina decubitus; glyceryl trinitrate 124 times per month
13	44 M	Grade 2 hypertension; cerebrovascular accident, angina; obesity	T 2 to T 12, 10/24/50	T-1 to L 1, 11/7/50	4½	Myocardial infarct (?) postoperatively with temporary heart block; no angina; mows lawn without pain
14	34 M	Grade 2 hypertension; angina; positive exercise tolerance test	T 1 to T 12, 5/17/51	T-1 to T 12, 5/26/51	3½	Occasional angina but can walk up two flights of stairs; still has positive Master's tolerance test
15	38 F	Angina, congenital syphilis	T 1 to T-4, April, 1951	T-1 to T 4 April, 1951	3	No angina
16	40 M	Angina myocardial infarction	T 1 to T 4, November, 1951	T 1 to T-4, November, 1951	1⅓	Died; pain relieved for 1 yr, until probable fresh infarct, although electrocardiogram and sedimentation rate negative; Beck operation for third infarct, with postoperative death
17	52 M	Anterior and posterior myocardial infarct, angina, 1949	0	T 1 to T-6	5¾	Rare angina—remarkably relieved from status anginosus; pain in left shoulder; relieved by glyceryl trinitrate
18	44 M	Angina decubitus	T 1 to T-4 6/23/53	T-1 to T 4, 6/23/53	2	No angina; nocturnal dyspnea relieved by glyceryl trinitrate
19	57 F	Angina 9 years, diabetes	T 1 to T 3 November, 1943	T 1 to T 3, September, 1944	11	No angina
20	42 F	Angina, asthma, pain while dressing or cooking; obesity	T 1 to T-4, 1/23/52	T 1 to T-4, 1/23/52	2½	Angina, mild; glyceryl trinitrate two to three times a week
21	44 F	Severe angina	T 1 to T 3, February, 1949	0	Died	Died 10 min after operation
22	40 F	Angina decubitus, incapacitated	T 1 to T-4, 1/29/53	T 1 to T 4, 1/29/53	2½	No angina
23	47 F	Angina; myocardial infarct (2 yr ago); relieved by sympathetic block	T 1 to T 4, 4/18/53	T 1 to T 4, 4/18/53	1½	Temporary relief; then again had angina decubitus with positive exercise tolerance test; "talc" operation elsewhere in June, 1954—no relief
24	54 M	Intractable angina 10 yr, electrocardiogram showed infarct		..	Died on table	Died during induction of anesthesia
25	54 F	Scleroderma; angina, Raynaud's disease	T 2 to T 3 1947	T-2 to T 3, 1948	5	No angina until before death, Jan 7, 1954
26	52 M	Angina (?), diagnosis never certain	T 1 to T 3, 9/16/50, inferior cervical ganglions	T-1 to T 3, 9/26/50	4½	Relieved for 6 mo; then pain returned; addiction to meperidine hydrochloride; pain relieved only by meperidine hydrochloride
27	60 F	Angina, grade 2 hypertension	T 1 to T 2, 8/1/44	0	7	Relieved for 2 wk; then had pain in jaw and precordium; died 9/2/51, cerebrovascular accident
28	38 F	Angina 2 yr; peripheral arterial insufficiency, angina when eating	T 1 to T 4 July 1954	T 1 to T 4, July 1954	4 mo	Much improved; no pain on eating
29	60 M	Angina decubitus esophageal hernia	T 1 to T 3	0	4½	No pain, occasional sensation of pressure in right shoulder
30	57 M	Angina	T-1 to T-4 October, 1953	T 1 to T 4 December, 1953	1	No angina; severe pain in scars; not working
31	49 M	Angina, 40 glyceryl trinitrate tablets a day	T 3 to T-4 and thoracic branches of stellate		2 wk	Died 2 wk after operation, congestive failure
32	39 F	Grade-3 hypertension; angina	T 2 to L-2, January, 1949	T 2 to L 2, January, 1949	5½	Rarely has angina; occasionally uses glyceryl trinitrate
33	43 M	Grade 3 hypertension; angina	T 2 to L-2, 1/8/51	T 1 to L-1, 1/17/51	4	Blood pressure 120/75 mm Hg; no angina; normal activities

where, with no relief. Addiction to meperidine hydrochloride was an important factor in the patient in case 26, and we were never quite sure of the diagnosis of angina. Operation resulted in relief of pain for six months; then the pain returned and was "relieved" only by meperidine hydrochloride.

Five patients had subsequent coronary infarctions, one fatal. In two patients severe angina returned. One of the five patients had myocardial infarction four months after discharge with return of anginal pain. She had demonstrable regrowth of sympathetic fibers by the sweat test. Another had complete relief for one year until infarction occurred. Regrowth of sympathetic fibers was demonstrated by the sweat test. The patient died after a Beck operation. A subsequent infarction did not affect a third patient, and in a fourth the infarction is too recent to know the result.

TABLE 2.—*Reasons for Failure of Eight Patients to Obtain Relief*

	Patients, No
Failure to resect right side (resection on right later done in 1 patient, with complete relief)	2
Only ganglions at T-1 and T-2 on left resected	1
Regrowth of sympathetic fibers	1*
Recurrence of angina after subsequent infarctions	2
Emotional overlay (1 with addiction to meperidine hydrochloride)	3

* This patient also had a subsequent infarction.

Summary and Conclusions

Thirty-three patients with severe disabling angina pectoris were subjected to resection of the anginal pathway. Three patients, or 9%, died of the operative procedure. Of the 30 patients surviving the operation, 18 had complete relief of anginal pain for one to 11 years, 8 noted mild exertional discomfort but were considered to have satisfactory results, and 4 obtained no relief from the procedure for a period of up to four months.

Failure to obtain immediate or permanent adequate relief was noted in eight patients. Two of these eight however, had complete relief for several months until infarction recurred. A third patient later obtained complete relief by a second more complete resection of the pathway. Two of these eight patients did not have both sides of the pathway resected; one of them had the other side resected later, with complete relief. A third had only the first and second thoracic ganglions on the left resected. There was regrowth of sympathetic fibers in one. Three failures were marked by an emotional overlay. In two of these the diagnosis of true angina was questionable. Five patients had subsequent coronary infarctions, one of which was fatal.

Although resection of the anginal pathway is not the final answer to the problem of disabling angina pectoris, it does offer relief to certain carefully selected patients. Probably the best results are obtained in patients with angina with hypertension, especially when the procedure is combined with extensive sympathectomy and splanchnicectomy. It is also of benefit to the patient with the overalarm type of anginal pain, provided a strong emotional overlay can be eliminated, admittedly a difficult calculation. This overalarm type of angina pectoris seems to bear some resemblance to reflex sympathetic dystrophy, which may account for the higher degree of response to sympathectomy. The operation may offer great relief to patients with angina decubitus who have not had a recent coronary occlusion or a great functional overlay.

PROMETHAZINE IN SURGERY

PRELIMINARY REPORT

Max S. Sadove, M.D., Chicago

• *Clinical impressions based on more than 1,000 administrations of promethazine in surgical patients showed that this drug is useful in anesthesiology as a sedative preoperatively, as a supplement to the milder anesthetics in producing the lighter planes of anesthesia and the hypothermic state, as a means of combating emesis and hiccups, and as a sedative postoperatively. The recommended procedure for premedication in the average case includes the intramuscular injection of 50 mg. of promethazine 120 minutes before induction, intramuscular injection of 50 mg. of meperidine 60 to 45 minutes before induction, and 0.4 mg. of either scopolamine or atropine 30 minutes before induction. The drug, with or without meperidine, has been used with excellent effect in children, and few side-effects have occurred when it has been given in usual dosages.*

Since the initial description of promethazine hydrochloride [N-(2-dimethylaminopropyl) phenothiazine hydrochloride], an antihistaminic derivative of phenothiazine originally designated as compound RP 3277,[1] a great many experimental studies of the pharmacological action of this and other phenothiazine derivatives have been carried out. Halpern and Ducrot showed that promethazine possesses the antihistaminic and antianaphylactic properties of other antihistamines and exerts a somewhat more prolonged effect than most of the other compounds of the phenothiazine group.[2]

The anticholinergic action of promethazine was described by Danielopolu.[3] Halpern and co-workers[4] demonstrated that promethazine exerts a local anes-

---

From the Department of Surgery, Division of Anesthesia, of the University of Illinois College of Medicine.

thetic action three times that of cocaine. Winter[5] showed that promethazine prolongs the hypnotic effect of barbiturates by about 40%. Laborit[6] described routine use of promethazine as a sedative the night before operation and at the time of the procedure to reduce the amount of anesthesia required. Numerous workers have demonstrated the antiemetic properties of promethazine in various situations associated with nausea and vomiting. Jacquenod and Mercier[7] reported reduction in postanesthetic vomiting by giving patients 50.0 mg. of promethazine in combination with 0.2 mg of scopolamine hydrobromide and 6.0 mg. of morphine administered subcutaneously before operation.

Promethazine resembles, in some respects, but is milder in action than, chlorpromazine hydrochloride, another phenothiazine compound that has been used, in conjunction with chlorpromazine and meperidine hydrochloride, for preoperative sedation in a small series of patients subjected to gynecologic surgery.[8] Laborit and co-workers[9] showed that administration of promethazine in combination with chlorpromazine and meperidine, under the proper circumstances, reduced body temperature and metabolism so that in some instances radical operations could be performed on elderly patients and on patients who were poor surgical risks.

At the present time promethazine appears to be a valuable part of the surgical armamentarium. Although there is little in the current literature on the usefulness of the drug in surgery, and further clinical trial will be required, it is felt at this time that a preliminary summary of clinical experiences is justified, on the basis of accumulating cases and increasingly stronger and more vivid clinical impressions. It is hoped that other workers in the surgical field who have access to laboratory facilities and sufficient clinical material will initiate studies to evaluate further, in a truly controlled manner, these clinical impressions based on more than 1,000 administrations of the drug.

A clinical trial was devised, during which promethazine was used in the following ways: (1) for preoperative sedation, alone and as a supplement to the commonly used agents; (2) as a supplement to the milder anesthetics, for production of the lighter planes of anesthesia and the hypothermic state, popularly known and loosely termed "artificial hibernation"; (3) as an antiemetic in patients experiencing nausea and vomiting or hiccups during general, spinal, or regional anesthesia; and (4) for postoperative sedation.

Preoperative Sedation

As emphasized in an earlier paper,[10] psychological preparation of the patient for any type of surgery is extremely important. Medication to relieve tension and dread on the day of operation is essential to the patient's emotional and physical well-being, so that he will arrive in the operating room in a calmer, more relaxed, and more cooperative frame of mind. In the immediate preoperative period, sedation should be adequate to allay anxiety and fear. The desired quieting effect should be achieved without depressing the medullary[10] and/or vital functions. Promethazine, in a dose of approximately 50 mg. orally, exerts a mild sedative action similar to that of the barbituates in the dosage generally recommended for preanesthetic medication in the average adult. However, if promethazine is used alone for preoperative sedation, much larger doses are required to produce a really satisfactory effect. Therefore, it was decided to try a combination of promethazine and meperidine, and this combination was used in a large number of adult patients subjected to cardiac, vascular, abdominal, and other major surgery.

Work sheets were prepared and completed on over 700 unselected patients. The drug was made available to the resident and attending staff at the University of Illinois Research and Educational Hospitals and to the residents and staff at St. Luke's Hospital. Work sheets were frequently incomplete and in many instances were not utilized at all, so that only impressions were available in at least another 500 cases. On review of the work sheet, it was felt that the data should not be tabulated here in the absence of specific controlled studies. Impressions, even though statistically significant, are, in the last analysis, only impressions. However, it is interesting that all who used the drug in the manner described agree with the over-all conclusions. Controlled studies are being done to evaluate these initial clinical impressions.

The following routine is now employed: 50 mg. of promethazine is injected intramuscularly two hours before administration of the anesthetic. An intramuscular injection of meperidine, usually in a dose of 50 mg., is then given 45 minutes to one hour before the anesthetic and scopolamine or atropine (0.4 mg., or 1/150 grain) one-half hour prior to induction of anesthesia. For preoperative sedation this combination is considered almost ideal, since a desirable calming effect is produced. The patient, while not actually asleep, lies in a state of tranquility, without interest in his environment and unaffected by external stimuli but with the ability to respond readily to questions.

Supplement to Anesthetics

Evidence is accumulating that seems to indicate that the amount of anesthetic needed can be reduced by supplementation with promethazine. If one uses certain of the other more potent phenothiazine derivatives to supplement the usual premedicaments and then adds to the procedure the usual induction with pentothal sodium or other depressant agents, one frequently sees an undesirable fall in blood pressure and tachycardia prior to induction. These conditions are aggravated by induction of anesthesia. With promethazine, however, the hazards of hypotension and tachycardia are materially lessened. Fall in blood pressure has not been noticeable in patients treated under this routine.

At present it is believed that in using promethazine there is little need, in the average case, to exceed a total dosage of about 80 mg., including the dose given for preoperative sedation. Promethazine can easily be administered by intravenous injection, as required, in divided doses of approximately 20 mg. Rarely is it necessary to administer a total dose of more than 100 mg. A satisfactory working basis for the dosage of promethazine used to supplement the anesthetic would be the administration of 15 to 25 mg. of a diluted solution in an early phase of anesthesia and, if necessary, an additional 5 or 10 mg. later in the procedure. The dosage should be determined by bioassay of the patient rather than by rule of thumb.

It has been observed that if one inadvertently gives a dose of promethazine that is larger than usual there is rarely an untoward reaction. One rarely sees the tachycardia, fall in blood pressure, and other evidences of overdosage that occur with more potent phenothiazine compounds. In a number of neurosurgical and general surgical procedures performed with the patient under local anesthesia, 25 to 50 mg. of promethazine has been administered before operation, with or without addition of scopolamine. Patients who were uncooperative and troublesome to the neurosurgeon or the general surgeon utilizing a local anesthetic soon became tranquil and tractable when increments of 10 mg. of meperidine and 10 mg. of promethazine were intermittently administered intravenously. The peak of action was present in 10 to 15 minutes.

Antiemetic Action

Also of interest to surgeons is the observation that, on several occasions when nausea and vomiting began to develop during spinal and regional anesthesia, promethazine controlled the disturbance and provided excellent sedation. In such instances, administration of even as little as 20 mg. will produce a surprising response in 10 to 12 minutes; all evidences of nausea and the threat of vomiting will frequently disappear. In one case, the antiemetic effect of the first dose wore off in approximately 15 to 20 minutes; an additional dose of 10 mg. again produced an excellent effect in depressing the tendency to emesis. In two patients who had hiccups during spinal anesthesia, 20 mg. of promethazine administered intravenously on two separate occasions gave excellent results in quieting the hiccups. This response may, of course, have been purely coincidental, but it is worthy of further investigation and utilization.

Postoperative Sedation

As a tranquilizing agent in the postoperative period, promethazine has a great deal to offer the patient. It has been my impression that there is less complaint of pain. Under the influence of this agent when it is combined with an analgesic, patients seem detached from their discomfort. They rest tranquilly, with rather stable blood pressure, pulse, and respiration; but they respond readily to any stimulus. Postoperative sedation with promethazine thus seems to lack many of the undesirable side-effects seen with the common sedatives and also seems to smooth out the effects of many of the narcotics. A small amount of promethazine given intramuscularly three times a day in the postoperative period will reduce the amount of meperidine or other analgesic required. The combination provides essentially the same amount of pain relief as larger doses of narcotics alone, with less depression of vital functions. It must be emphasized, however, that, when promethazine is used as a supplement in the postoperative period, narcotics should be given in smaller doses than those ordinarily used; that is, as little as one-sixth to one-half of the usual amount.

Comment

Promethazine, a phenothiazine derivative apparently capable of influencing the central nervous system in a rather benign and predictable fashion, lends itself well to the anesthetic techniques commonly used in surgery. The compound acts rapidly and produces an excellent degree of sedation of fairly prolonged duration. There is little or no sign of interference with the medullary functions; no flushing and no respiratory or cardiovascular depression are seen. A mild hypotension may occur when promethazine is used with atropine or a heavy dosage of meperidine or morphine. The pulse tends to be slow and strong rather than rapid. There is also a distinct impression that this compound affords protection against stress, as do chlorpromazine and other similar nervous system depressants. Future experience should provide more adequate evidence to support this impression.

Few side-effects have occurred when promethazine is used in the usual clinical dosage. It is the clinical impression at this time that the drug is extremely safe. Since children tolerate the compound well, it is often given to them for sedation. It is useful also for elderly patients, who seem to experience less confusion with the use of promethazine than with many other sedatives. This observation should be of interest to those who are called on to treat children and patients in the older age group.

In children who need only slight sedation, 0.25 mg. to 0.5 mg. per pound of body weight has been found to work well. This dosage is usually combined with administration of atropine or scopolamine. When there is extreme fright or pain, or when actual sleep is desired, this same dosage of promethazine may be combined with an equal dosage of meperidine. This combination has been used with excellent effect in many debilitated children. When the combination is used, the dosage of both drugs tends to be closer to 0.25 mg. per pound; to this is added the atropine or scopolamine. In the adult, the best sedation is probably gained by a combination of promethazine and a narcotic, reinforced either by scopolamine or atropine.

From this preliminary survey, it is concluded that this compound is a valuable agent for use with spinal and regional anesthesia. Production of basal anesthesia with promethazine is one of the safest techniques available. Further investigation is indicated to confirm these observations.

840 S. Wood St. (12).

The promethazine used in this study was supplied as Phenergan by Wyeth Laboratories, Philadelphia.

BREATHLESSNESS IN COAL MINERS

Joseph E. Martin Jr., M.D., Elkins, W. Va.

- *Of 230 soft-coal miners who presented some form of cardiorespiratory symptoms, over half were found to have x-ray evidence of coal workers' pneumonoconiosis. These findings, over a one-year period, and repeated in the following year, showed the incidence of this condition represented almost 31% of a total hospital population of coal miners. This deposition of coal dust and fibrosis, which can cause disability and even death, is significantly different from classic silicosis therapeutically and prognostically.*

Chest x-rays alone, while presenting characteristic lesions, do not necessarily indicate the degree of disability. Vital capacity, timed vital capacity, and maximal breathing capacity, expressed as a percentage of the estimated normal, appear to demonstrate disability inversely proportional to the decrease in maximal breathing capacity. Miners who had less than 35% of the estimated normal could do little more than walk slowly on a level plane. The studies seem to indicate that this condition poses a significant hazard to those in the coal industry.

During the year of 1954, 230 soft-coal miners, in a 100-bed general hospital in the soft-coal fields of West Virginia, were studied with particular reference to their cardiopulmonary systems. Attention was directed to their chests either by symptoms or by abnormal chest x-rays. The most common symptoms were exertional dyspnea, coughing, wheezing, and chest pain. Of the 230 miners, slightly less than 20% were found to have significant cardiovascular abnormality other than strain or hypertrophy of the right side of the heart. Five were found to have open pulmonary tuberculosis; four had carcinoma of the lung. In roughly three-fourths of the miners no causes were found for symptoms or chest x-ray abnormalities other than those referable to the respiratory system. One hundred thirty-four, or 58%, had chest x-rays showing coal workers' pneumonoconiosis.

Coal workers' pneumonoconiosis is defined as a chronic respiratory disease that may cause disability and death. It is caused by the inhalation of coal dust and has characteristic x-ray and pathological patterns. Much of the investigation in establishing the specific x-ray and pathological findings in this disease has been done by British workers, particularly those of the Pneumoconiosis Research Unit of the Medical Research Council.

Forms of Pneumonoconiosis

Pathologically, coal workers' pneumonoconiosis occurs in two separate but related forms: simple pneumonoconiosis and infective or complicated pneumonoconiosis, or progressive massive fibrosis. Microscopically, the essential lesion of this disease is focal deposition of coal dust and a little fibrosis about the respiratory bronchioles and their accompanying blood vessels. In early lesions the dust occurs in phagocytes enmeshed in a little reticulin fibrosis. As the lesion progresses, the outline of the phagocytic cells disappears and a few collagen fibers, occasionally arranged in bundles, may be seen. This deposition of dust is primarily interstitial, but it does extend into surrounding alveoli and alveolar walls. A little of it collects around some of the venules underneath the pleura. To the naked eye the coal dust appears as black spots (coal macules) measuring from 0.5 to 7.0 mm. or slightly larger and having a stellate or "Medusa-head" outline. These are rather sharply defined and are fairly uniformly distributed throughout the lungs. The bronchioles in cross section are insheathed by deposits of coal dust and fibrosis. As a result of a dilatation of these coal-insheathed bronchioles, small emphysematous areas are clearly visible. This emphysema, called focal emphysema, is a striking feature of many cases of coal workers' pneumonoconiosis and always occurs in relation to the coal macules. Further progression is characterized by an increases in the number of small coal macules and, to a much lesser extent, by an increase in the size of the individual macules. They occur earliest and most frequently in the midlung fields.[1]

The second form of the disease, infective or complicated pneumonoconiosis, or progressive massive fibrosis, shows rounded or elongated masses of dense black tissue frequently occupying the whole or greater portion of a lobe. Microscopically, these masses consist of dense collagen fibers in bundles that tend to be

Read before the Section on Preventive and Industrial Medicine and Public Health at the 105th Annual Meeting of the American Medical Association, Chicago, June 13, 1956

arranged in a parallel of radial fashion rather than in whorls as in classic silicosis. There are varying amounts of coal dust and inflammatory cells enmeshed in these fibers. These masses are found most frequently in the upper and midportion of the lungs. Further progression of the disease leads to gross distortion of the lungs, with elevation of the hili and formation of bullous emphysema in the bases. Rather characteristic changes in blood vessels have been described.[2] Changes in arteries due to aging are usually more marked, even in cases of simple pneumonoconiosis, than in comparable age groups. Invasion of various layers of blood vessels by fibrosis, cells, and coal dust causes obliteration of capillaries, arterioles, venules, and larger blood vessels. Thrombosis of larger vessels may occur.

Simple Pneumonoconiosis.—Simple pneumonoconiosis is caused by retention of coal dust in the lungs. The exact fraction of coal dust that causes it is unknown, but silica is not thought to be the most important.[3] With exposure to dust of varying silica contents, lesions with varying amounts of fibrosis may be seen. With higher silica contents, the lesions may approach those of classic silicosis in appearance. Thus, there may be a whole spectrum of lesions, with simple pneumonoconiosis, characterized by much dust and little fibrosis, at one end and classic silicosis, characterized by much fibrosis and little dust, at the other.

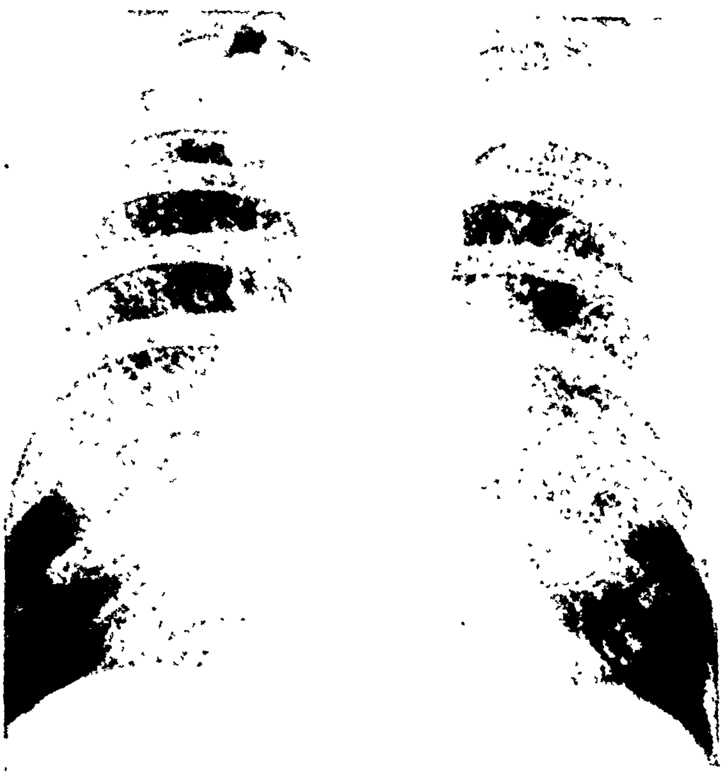

Fig. 1.—Chest x-ray of a 53-year-old soft-coal miner who worked underground 20 years, showing coal miners' pneumonoconiosis, category 3/-/-. (For explanation of code see Fletcher.[6])

Progressive Massive Fibrosis.—After sufficient dust has been deposited to cause simple pneumonoconiosis, the lungs are liable to an infectious process that produces the appearances of progressive massive fibrosis. There is much pathological, bacteriological, and epidemiological evidence to indicate that this infection frequently is tuberculosis. However, reaction of the body to tuberculosis is modified by coal dust so that the manifestations are usually those of mechanical interference with the flow of blood and air rather than toxic effects. Occasionally ordinary pulmonary tuberculosis is seen.[4] Simple pneumonoconiosis progresses only with continuing exposure to dust; progressive massive fibrosis may worsen whether or not there is further exposure to dust. It must be emphasized that progressive massive fibrosis, though thought to be due in part to infection, occurs only in those lungs that already have retained sufficient dust.

X-Ray Findings and Classification

The characteristic x-ray lesion of coal workers' pneumonoconiosis is a small, more or less circular density.[5] These opacities are less circular, less dense, and more poorly defined than those caused by silica. They measure 0.5 to 4.0 mm. in diameter and occasionally somewhat larger. By aggregation of these small masses, granular densities up to 5 mm. in diameter may occur. These densities usually occur in groups of contiguous opacities that may be joined by fine linear opacities, resulting in a lace-like or reticular pattern. These opacities are fairly uniformly distributed in both lung fields but tend to occur earlier and in greater numbers in the midportions of the lung, more frequently on the right. Progression of the disease causes an increase in the number of opacities rather than an increase in their size.

The appearance of rather poorly defined densities of more than 1 cm. in diameter marks the beginning of progressive massive fibrosis. In the early stage of the disease, these masses are more poorly defined than the smaller opacities. They commonly occur in the posterior lateral segments of the upper lobe and the apical portion of the lower lobe. These opacities may increase in size, density, and homogeneity until they occupy a whole lobe. With shrinkage of these lesions, gross distortion of the architecture of the lung and the production of bullous emphysema may be seen.

A classification of coal workers' pneumonoconiosis based solely on the x-ray appearance of the chest has been proposed by the Pneumoconiosis Research Unit.[6] There are two main divisions: simple pneumonoconiosis, characterized by the appearance of small discrete opacities, and progressive massive fibrosis, characterized by the appearance of large densities measuring more than 1 cm. in diameter. Simple pneumonoconiosis is then divided into three categories: 1, 2, and 3, according to the number and extent of characteristic lesions and, to a lesser degree, according to the obliteration of normal lung markings. In category 1, the characteristic lesions are seen over an area of at least 1 sq. cm. in each of two or more intercostal spaces. In category 2, the opacities are more numerous and distributed throughout the lung fields, except in the peripheral thirds, where they are sparse or absent. Vascular markings are still visible, but less clearly than in category 1. In category 3, the lungs appear to be packed full of these opacities and only an occasional large vessel is seen.

Progressive massive fibrosis is divided into four categories: A, B, C, and D. In the earliest stage, category A, one or more larger, more homogeneous opacities than those characteristic of simple pneumonoconiosis are seen. These measure at least 1 cm. in diameter. In category B, one or more of the characteristic shadows, more homogeneous than those of category A, but still of uneven density and covering less than three anterior intercostal spaces, are present. In category C, the opacities cover more than three anterior rib interspaces. When gross alteration of the lung, in addition to one of the above lesions, has occurred, category D has been reached.

For accurate diagnosis and categorization of coal workers' pneumonoconiosis, x-ray films of adequate quality are necessary. The exposure should be not more than one-tenth of a second, and there should be a high degree of contrast. The vertebral column, but not the intervertebral disks, should be just visible through the heart shadow. Considerable experience in reading of x-rays is necessary for correct interpretation, both as to the presence of characteristic opacities and as to the categorization of the films. It has been found that two readers viewing the films together and comparing them with standard films, procurable from the Pneumoconiosis Research Unit, will produce a higher degree of accuracy than one reader working alone.[7] There is a marked tendency among those starting to use this classification to overread. However, with experience and adequate x-ray technique, consistent and reproducible readings are possible. We have found that the vast majority of chest x-rays in soft-coal miners in our area readily fall into this classification.

Disabilities Caused by Pneumonoconiosis

Pathological changes of increased fibrosis, space-occupying lesions, and alteration and obliteration of air and blood pathways, as well as frequently accompanying bronchospasm and infection, may contribute to the symptoms and abnormal physiology. Among the abnormalities caused by pneumonoconiosis are decreased total lung volume, decreased vital capacity, decreased timed vital capacity, decreased maximal breathing capacity, increased residual volume, impaired intrapulmonary mixing of gas, and alteration of blood flow. Motley,[8] working in the United States, has implicated the distribution factor as being the major cause of disability in this disease. There is little evidence of interference of gas exchange across the alveolar-capillary membrane. Rather, the difficulty is in getting air with sufficient oxygen to alveoli with adequate blood flow. It is thought that in many cases of simple pneumonoconiosis the accompanying focal emphysema may cause enough increase in the dead space to contribute significantly to the dyspnea frequently observed. These abnormalities may result in increased work of breathing, decreased oxygen content of the blood, increased carbon dioxide content of the blood, and increased pressure in the pulmonary circuit. These changes may produce dyspnea, at first only with exertion but later even at rest. In the latter stages of the disease, congestive failure due to failure of the right side of the heart may occur. In one group of 136 autopsies on coal miners with progressive massive fibrosis, it was found that 57 had died of cor pulmonale without any other cardiac lesions. In 81 cases of simple pneumonoconiosis, four patients had died of cor pulmonale due to dust lesions alone.[9]

Frequency of Grades of Maximal Breathing Capacity in Various X-Ray Categories of Coal Workers' Pneumonoconiosis

	% of Estimated Normal Capacity					
X-Ray Categories	90+	89-80	79-55	54-35	<35	Total
<1	4	1	9	7	9	30
1	13	4	9	8	2	36
2	12	9	12	17	3	53
3	10	1	5	3	3	22
Progressive massive fibrosis	1	4	10	8	4	27
Total	40	19	45	43	21	168

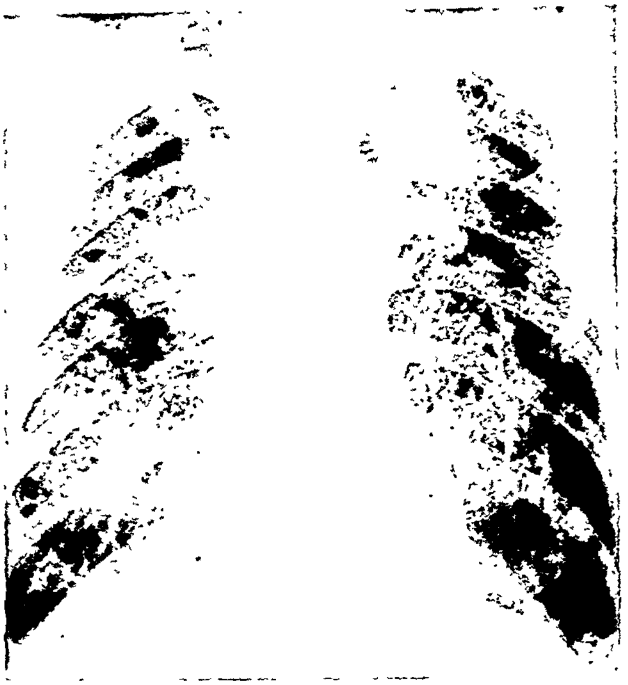

Fig. 2.—Chest x-ray of a 60-year-old soft-coal miner who had worked underground 33 years, showing coal miners' pneumonoconiosis, category 3/D/4-3.

During 1955, approximately 480 miners were patients in our hospital. Of these, 168, or slightly less than 31%, showed x-ray evidence of pneumonoconiosis. This sample is highly selected, in that all the miners had symptoms (not necessarily respiratory) or x-ray changes severe enough to cause them to seek hospitalization. All these patients had determinations of maximal breathing capacity, vital capacity, and timed vital capacity measured on a 13-liter Collins recording respirometer. Since maximal breathing capacity in normal persons varies with body surface area and decreases with age, a formula based on these factors was used to estimate the normal for each individual patient.[10] For convenience in handling figures, the maximal breathing capacity is expressed as a percentage of the estimated normal.

The table shows the number of patients with pneumonoconiosis in various x-ray categories and the maximal breathing capacity found in these. In the vertical column labeled "Total" is given the number found in each category. Thirty patients, or 17.9%, had definite lesions of pneumonoconiosis that were of insufficient extent to be classified as category 1. Thirty-six, or 21.4%, had lesions classified in category 1; 53, or 31.5%, in category 2; and 22, or 13.1%, in category 3. Twenty-seven, or 16.1%, showed progressive massive fibrosis. Across the top of the table are groups of maximal breathing capacities expressed as a percentage of the estimated normal, indicating, roughly, grades of disability as proposed by Motley.[10] Values of more than 80% are considered to show little or no evidence of disability. Disability increases with decrease in maximal breathing capacity, so that the values of less than 35% are considered to indicate far-advanced disability. As a matter of fact, those miners we studied who had a maximal breathing capacity of less than 35% of the estimated normal were usually able to do little more than walk slowly on a level plane.

Inspection of the table shows that all grades of respiratory disability were found in all categories of pneumonoconiosis. Thus 26, or 39.4%, of the 66 patients showing pneumonoconiosis classified as less than category 2 had a maximal breathing capacity less than 55%. In contrast, 5, or 18.5%, of the 27 patients with progressive massive fibrosis had maximal breathing capacity of more than 79%. This suggests that chest x-rays do not necessarily indicate the degree of disability.

Prevalence of Disease

Pneumonoconiosis.—There are no adequate statistics on pneumonoconiosis in the United States, but good statistics concerning the prevalence of the disease in Great Britain are available. Prior to 1952, nearly 30,000 cases of pneumonoconiosis in South Wales and more than 7,000 in the rest of Great Britain had been certified.[3c] Comprehensive surveys of various mines in Great Britain, in which from 75 to more than 99% of the working, disabled, and retired miners were x-rayed, showed pneumonoconiosis had occurred in from 26.0 to 61.8% of the miners. Progressive massive fibrosis was found in from 2 to 13% of the miners.[11] The incidence of x-ray evidence of pneumonoconiosis increased with both the age of the patient and the length of his exposure to dust. Thus, of the miners between the ages of 26 and 35 years, nearly 8% had pneumonoconiosis classified as category 2 or above; whereas in the age group of 36 to 45 years, 31% had disease so classified. After 1 to 10 years' exposure to coal dust, 12% had pneumonoconiosis classified category 2 or above; after 11 to 20 years the proportion was 42%. A survey of four coal mines in northern England showed that 32% of the miners had evidence of pneumonoconiosis and that 22% suffered from disease classified as category 2 or above.[12]

Early studies of relatively limited numbers of miners in the United States showed that x-ray changes did occur and that respiratory disorders seemed to be unusually common. Heppleston,[3d] after studying pathological specimens of the lungs of 50 American coal miners, considered the disease process to be identical with that found elsewhere in the world. Chest x-ray films of miners in soft-coal regions in West Virginia, Pennsylvania, Maryland, and Ohio have been viewed by three British workers and one French worker in this field. They have agreed that the lung changes are similar to or identical with those seen in other countries. That the incidence of pneumonoconiosis in the United States is not insignificant would seem to be indicated by our finding of 134 persons in 1954 and 168 in 1955 with x-ray evidence of this disease. This represents slightly less than 31% of the miners in a total hospital population.

Silicosis.—In Pennsylvania, during the period 1950 through 1952, compensation was given for 1,115 cases of anthracosilicosis. In West Virginia, 1,923 claims for "silicosis" were processed during 22 months in 1953 and 1954.[13] Coal miners' pneumonoconiosis is not yet recognized legally as distinct from silicosis in West Virginia. Silicosis is defined, for legal purposes, as a nodular disease of the lungs resulting from exposure to dust containing silica. Stages are determined by x-ray change and clinical evidence of disability due to respiratory insufficiency. More than 90% of the claims for "silicosis" are from coal miners. During the 23 months from July, 1954, to June, 1956, 1,752 claims for "silicosis" were processed in West Virginia. Compensation was granted in 1,412. In 29 cases death was considered to be due to "silicosis." Compensation for silicosis, stage 1 (x-ray evidence of disease with little or no clinical disability), was granted in 1,383 cases; for silicosis, stage 2 (x-ray evidence with moderate clinical disability), in 277 cases; and for silicosis, stage 3 (x-ray evidence with total and permanent disability), in 45 cases.

Chronic Bronchitis and/or Pulmonary Emphysema.—Evidence is accumulating, both abroad and in the United States, that chronic bronchitis and/or pulmonary emphysema are more prevalent in coal miners than in workers in many other occupations. Pemberton[14] studied three groups of men between the ages of 45 and 64 years in the United States. Two hundred forty-two of them were soft-coal miners, 238 lived in a rural area and were employed in agriculture or nondusty trades, and 141 lived in an industrial city and were employed in a modern factory, where there was very little dust. A history of chronic cough, bouts of raising of yellow sputum, wheezing, and the finding of reduced timed vital capacity was, in the absence of other causes, considered to indicate the presence of chronic bronchitis and/or pulmonary emphysema. Chronic bronchitis and/or pulmonary emphysema was nine times more frequent in coal miners than in rural workers and four and one-half times more frequent in rural workers than in workers in nondusty industries.

In the group of 26 coal miners in our 1955 study who showed advanced respiratory disability as indicated by a maximal breathing capacity of less than 55% and little x-ray change (pneumonoconiosis of a category less than 2), 22 had quit working because of shortness of breath. Fifteen of these 22 were found to have chronic bronchitis and/or pulmonary emphysema as defined above. Their maximal breathing capacity ranged from 18 to 54% of the estimated normal. Their three-second timed vital capacity ranged from 60 to 77%.

Summary and Conclusions

Coal miners, just as many nonminers, may have chronic breathlessness caused by such disorders as hypertensive or arteriosclerotic cardiovascular disease, pulmonary tuberculosis, or lung cancer. There is no evidence of an increased incidence of these in coal miners. In addition to these causes, it appears that coal miners, because of their working environment, may develop chronic breathlessness due to coal workers' pneumonoconiosis or chronic bronchitis and/or pulmonary emphysema. Coal miners' pneumonoconiosis occurs in the United States. It is significantly different from classic silicosis and has very different prognostic, therapeutic, and socioeconomic implications. We have only inadequate data as to the frequency of its occurrence in the United States, but the evidence would seem to indicate that it poses significant hazard in the coal industry. There is less certainty as to the problems of chronic bronchitis and pulmonary emphysema in coal miners. Again, the fragmentary evidence that we have would seem to indicate that it too is significant. It is quite evident that much more comprehensive and systematic study of these disorders is urgently needed in the United States.

COMMUNITY PROGRAM TO PROVIDE HEARING SERVICES

Helen M. Wallace, M.D., John F. Daly, M.D., Robert Hui, M.D., Margaret A. Losty, R.N.
and
Donald Markle, M.Ed., New York

• *A survey of 24 agencies that provide services for patients with hearing problems was carried out in New York City for the purpose of determining what personnel, facilities, and programs would be considered adequate for complete, integrated service. Some of these agencies were rather limited as to the facilities available or specialized as to the type of patient served. For maximum usefulness, a rehabilitation center for the hard of hearing needs both medical supervision supplied by otologists and pediatricians and paramedical skills supplied by such personnel as audiologists, speech therapists, nurses, social workers, and psychologists. The physical facilities should include sound-treated areas for diagnosis and therapy, reception and observation rooms, ear mold and electronics laboratories, and other areas adding up to about 2,500 sq. ft. (230 sq. m.) of floor space. There are advantages in locating the hearing center in a large general hospital connected with a medical school. A hearing program is costly; the general community must be prepared to assist in financing it*

Scientific and technical progress in the field of hearing has occurred so rapidly during the last 10 years that a new field of study has resulted. The task of making these advances available for the conservation of hearing and rehabilitation of patients with impaired hearing constitutes the next logical step. Although much can be accomplished by the individual otologist —in uncomplicated hearing problems—there remains a large number of patients requiring not one or two specialists, but many, in order to reach the fullest degree of rehabilitation. The team approach has been the natural outgrowth and will be the determining factor in the quality of patient care. The large number of patients requiring these services in the community and the cost of developing and operating such services have made this a responsibility of the community. This has been realized by many communities that are now actively engaged in developing hearing conservation programs This paper is the report of the steps taken in New York City since 1952 to promote a program for patients with hearing impairment.

Extent of the Problem

There are no accurate statistics on the number of acoustically handicapped persons in the United States. Estimates of the number of persons who have a hearing loss (ranging from a slight loss to almost total deafness) range from 7 million to 14 million, while an estimated 800,000 persons wear hearing aids as compared with an estimated 1,600,000 who need them.[1] Estimates of the number of children with hearing impairment range from 2 to 12% of the population up to a figure of 3 million. The Office of Vocational Rehabilitation has estimated that there are at least 33,000 deaf civilians and 206,000 who are hard-of-hearing who are eligible for services from state vocational rehabilitation

---

From the Bureau for Handicapped Children, New York City Department of Health, and the Department of Otolaryngology, New York University-Bellevue Medical Center. Dr. Wallace is now at the University of Minnesota School of Public Health, Minneapolis agencies. In New York City, it is estimated that 30,000 to 40,000 children of school age have a hearing loss requiring a careful evaluation. The number of preschool children and adults so affected is unknown.

Steps Taken in Development of New York City Program

Over the past three years, a series of steps has been taken to develop new services and strengthen existing ones for children and adults with hearing problems. These steps include the formation of an advisory committee of experts drawn from the fields of otolaryngology, pediatrics, audiology, speech therapy, social service, education, and vocational rehabilitation; a recommendation by the advisory committee that a number of hearing centers be developed in the larger general and teaching hospitals in the community; the establishment of recommended standards for hospital hearing centers by the advisory committee;[1A] a survey of all known existing services in the community; assistance to interested hospitals in developing hearing centers; payment for care by the official health agency; and strengthening case-finding in school children by providing additional modern audiometric testing equipment for use by the local school system.

Survey Findings

During 1953 and 1954, a survey of 24 facilities within New York City was performed by a team composed of the consulting otologist and the hospital nursing consultant to the bureau for handicapped children of the New York City Department of Health. These 24 facilities were selected because there was some evidence that they were providing some services for patients with hearing problems. The 24 facilities were located in 14 general hospitals, 6 specialty hospitals, and in 4 detached services (public school for the deaf, voluntary hearing agency, private school for the deaf, and one specialty outpatient hospital). Of the 24 facilities, 22 cared for both children and adults and 2 cared for children only. In general, those facilities caring for both children and adults dealt chiefly with adults, with only a small proportion of children among their patients. These facilities were analyzed according to physical plant, personnel, and policies and procedures.

Physical Plant.—Four of the 24 facilities had some degree of an integrated unit for the diagnosis, treatment, and rehabilitation of patients with hearing impairment. None of these four, however, was completely integrated in the strict sense, as each lacked one or more services in the unit proper. All the four units presenting some degree of integration were located in general hospital facilities offering all consultation services on request.

Eleven of the 24 facilities provided sound-treated areas. Treatment for sound attenuation was not adequate, and in only four facilities was the sound treatment considered adequate. Twenty-one of the 24 facilities provided at least one audiometric testing room. The audiometric testing rooms varied from the use of a corner in the general hospital laboratory to completely sound-treated areas. Although pure tone screening audiometers were in almost all the units, critical testing was available in only the four adequately sound-treated facilities. Six facilities provided auditory training rooms, but in only four were they adequately sound-treated. Only one-third of the facilities provided space for speech therapy. Two of the facilities provided an otological examination room within the unit proper; the other facilities used the general ear, nose, and throat clinics that were usually adjacent or in another area of the hospital. None of the facilities provided space for general pediatric examination within the unit proper.

One facility took ear impressions and made ear molds; four other facilities took ear impressions only. Most referred patients to commercial companies for ear impressions and ear molds. Electronic workshops were found in two, with most of the facilities engaging the services of an outside commercial electronic technician. Offices for a social worker and a psychologist were not provided in any unit.

Personnel.—Each of the 24 facilities had a designated director of the hearing service. In 19 the director was a part-time otolaryngologist, in two an audiologist, in two an educator, and in one a psychiatrist. Five had a full-time director. All except four had an otologist on their staff. Part-time otologists spend from one half-day to three half-day sessions in the clinics. Medical consultants in the fields of pediatrics, medicine, surgery, neurology, orthopedic surgery, psychiatry, and plastic surgery were available in two-thirds of the facilities. Diagnostic x-ray facilities were available in all except three. The medical and surgical consultation services were readily available only in those units associated with a large general hospital. In the units requiring outside medical consultations, no established channel of liaison was evident. There was also much chance of loss of contact and integration of planning of therapy for individual patients.

Eight provided one or more qualified audiologists; of these, three were advanced audiologists qualified according to standards.[2] In other units, the audiologic personnel either had participated or were participating in a program leading to basic certification. Lack of sufficient qualified personnel reflects a lack of proper care in most units. Nine provided one or more qualified audiometric technicians.[2] Frequently, audiometric technicians were trained by the audiologist in charge or in some instances by the otologist. Such personnel might be satisfactory for pure tone audiometric screening procedures, but advanced audiometry would require more highly trained personnel. Twelve provided one or more qualified speech therapists,[2] and nine provided one or more qualified hearing therapists.[2] Ten facilities had a psychologist available, although none had a psychologist specifically assigned to the hearing unit. The most important gap in this area was the need for the available psychologists to have had some previous training and experience with children, particularly children who are handicapped in communication disorders. Six facilities provided a qualified social worker, and one provided a social worker who was not qualified; no hearing unit had a full-time social worker assigned. Usually the available social worker was shared with several other services, so that limited time was available to patients in the hearing unit. No unit had a nurse assigned to it; 15 facilities had a nurse assigned to an adjacent area, usually the ear, nose, and throat clinic, and available on call. Three facilities had an electronics technician.

Twelve facilities were approved by the American Medical Association Council on Medical Education and Hospitals for residency training in otolaryngology, 12 in pediatrics, and 5 in physical medicine and rehabilitation. Few facilities offered a program of instruction in audiology for members of the medical house staff. The others approved for residency training in otolaryngology usually limited their instruction to the technique of audiometric testing.

Policies and Procedures in Services.—Pediatric examinations, although not provided directly within any hearing unit, were routinely provided by the hospitals in six instances. The other facilities had a stated policy of referral of children to an outside pediatric clinic or to a private pediatrician on an indicated basis. The frequency of such referrals is unknown, but the general impression gained was that it was rare.

Otological examinations were available in the unit or adjacent ear, nose, and throat clinics in all except one facility. Pure tone audiometric testing was available in every facility. Advanced audiometry, such as in speech reception, discrimination recruitment, psychogalvanic skin testing, and malingerer testing, was limited to the units in large hospitals. It was the opinion of the survey team that children could be adequately tested in seven of the facilities surveyed. Psychological evaluations were performed in 10 agencies but none in the hearing units. Patients were referred to psychologists in adjacent medical services. Speech evaluation and speech therapy were performed in 13 facilities.

Selection and fitting of hearing aids and auditory training were performed in nine facilities. They were performed in the units capable of doing speech audiometry and therefore in the larger units. There were seven units that were performing evaluations of hearing aids using an objective scoring method; there were two others using a subjective method that is not generally considered adequate. Some facilities referred patients to hearing aid dealers for selection.

Vocational guidance procedures were delegated to the social service staff; since in most facilities the social service staff was limited, the emphasis placed on this aspect of the patient's rehabilitation was likewise limited. Only two facilities held regular audiology or hearing conferences for discussion of diagnosis, treatment, and rehabilitation of the patients.

Nine facilities had a unit system of records. The unit system of records was the only mechanism for integration of reports from various consultation services and was found only in the large general medical facilities. Twelve facilities stated they routinely sent back reports to the school of referral, and nine stated they routinely sent reports to the referring practicing physician. Fourteen facilities had a system for seeing patients on an appointment basis, and 10 had a method of follow-up of broken appointments.

Evaluation.—Physical plants were inadequate for the complete care of a child handicapped with a hearing or speech defect, from the viewpoint of both diagnosis and rehabilitation. A general lack of space and inadequate sound treatment was found. Most of the facilities surveyed could perform pure tone testing only. A second major need was for qualified personnel. Such a need ranged from the position of director with sufficient time to organize and develop the service down through the various skills necessary in complete evaluation and rehabilitation of the patient. The staffs of many facilities surveyed were genuinely interested in improving their services but were hampered largely by lack of space, lack of personnel, and lack of funds.

Development and Functions of Community Hearing Centers

It is our opinion that a hearing center, to be adequate, should perform the following functions: (1) It should provide complete services for the diagnosis, treatment, and rehabilitation of children and adults who have or are suspected of having a hearing impairment. (2) It should care for not only patients usually known to the hospital but also patients referred to it by practicing physicians, community agencies, school health and child health services, and industry. (3) It should provide interpretation and guidance to the patient and his family and should assist the patient and his family in making the necessary plans for the patient's total maximum rehabilitation. (4) It should be a training center for professional personnel of all types, both at the undergraduate and postgraduate levels. (5) It should perform research. With these functions in mind, what should a hearing center provide?[1A]

Medical Direction and Supervision.—Medical direction of the center's activities is essential, because the investigation and recommendations are based upon medical findings. It is probably not practical to have a full-time medical director. It is natural to look to the otolaryngologist for this type of medical direction. Weekly staff conferences should be conducted by the medical director. In order to maintain a high quality of service and coordination, a full-time coordinator or supervisor of the center is necessary. This responsibility can be best assumed by the audiologist with advanced certification in hearing and speech or its equivalent.

Medical supervision by qualified otolaryngologists and pediatricians is necessary for the initial evaluation of the patient and for continuing medical treatment and rehabilitation. Ideally, at least one otolaryngologist and one pediatrician should be assigned to the center staff to participate in direct patient care, to function as a member of the center team, and to attend the center's staff conferences. In addition to these two essential medical services, consultation should be readily available from all of the related medical fields such as neurology, psychiatry, radiology, plastic surgery, orthopedic surgery, and orthodontia.

In addition, it is highly [illegible] that [illegible] of the house staff [illegible] services be [illegible] change in focus from the diagnosis and treatment of disease to the diagnosis and treatment of the total individual. Scientific clinical *medicine with its* patient-centered concept of the total individual was not accepted easily, nor without battle. For many years the bacteriologists, anatomists, and pathologists argued vehemently that the individual was not an entity but only an aggregate of atoms, electrons, cells, and segments and that one could not "diagnose" an individual; one could only diagnose disease, bacteria, pathology; one could not treat the whole individual but only broken bones, ulcers, and diseased members, and only in so doing could the individual gain health. It was a long, hard battle that has not as yet been completely won, because, after acceptance of the *physical entity* of the individual, along came the psychiatrists who insisted upon the physical and mental oneness of the individual—psychosomatic *medicine. Later, the recognition of the* importance of social medical factors in the health of the whole patient necessitated a knowledge of the family and community impact upon the health of the individual. Scientific clinical medicine today does believe and teach that the whole patient—physical, mental, and social—must be the focal point of medical practice.

Evolutionary development of medical and health science.

Era of Community Health

The third profound change has developed in recent *years, and the era* of community health is emerging. The change is fundamentally a change from diagnosis and treatment of the individual to the diagnosis and treatment of the health needs and status of the community as an entity—the scientific diagnosis and treatment of the body politic. Here, too, the major issue is not new gadgets or new functions but a new approach, a new focus, a new science, and a new profession. In scientific public health, we no longer treat the individual—the segment of the community—but the total body politic—mental, physical, social, and economic. We no longer treat individuals who have communicable diseases, but we prevent, control, or eradicate the disease in the body politic. The total patient is our responsibility and not the individuals who are a part of it. Our patient is more than a mere aggregation of individuals, just as the individual is more than an *aggregation of cells* or segments. This does not mean that we ignore the individual any more than the physician ignores the ulcer or the segment or the disease germ in the individual. The doctor treats the broken hip but only incidentally to the treatment of the individual. He may not, on occasion, even attempt to set the broken hip, because the total health of *the individual* is more important, but if he does set the hip he *does it only for the* purpose of functionally curing the individual. The day has passed when we can *say the* operation was successful but the patient died.

Similarly, public health will have to continue to do many things for individuals that society demands. The health officer may have to be the county coroner, or jail physician, until a proper medical examiner system is adopted, or until other private physicians can be persuaded to assume the duties of individual medical care for the inmates of the penal *institutions. But the health officer is not* doing public health when he does these things. He is doing, I hope, scientific practice of medicine, and I hope he will be relieved of these duties shortly because that is not the best use of his new skill and knowledges. The health department may have to continue to conduct such services as well-child conferences and immunization clinics for individuals, indigent or otherwise, until organized medicine finds a better way to maintain community immunity. The purpose of these clinics should be better protection for the health of the total body politic, not *for the health of any individual* in that body politic.

This profound change, as in the past, has been and will be bitterly opposed by many eminent scientists. Their argument has a familiar ring: "The community is not an entity but only an aggregate of individuals, and in curing individuals the ills of the community will be cured." Fortunately the advances in health science and social science clearly indicate the fallacy of their argument. Most people recognize that the community is an entity, not merely an aggregate of people, an entity different from every other community as every *individual is different from his* neighbor. It is different in its physical make-up, geographical and demographic limitation, social structure, power structure, governmental and legal structure, mental and emotional patterns, ethnic groups, mores, religious and nutritional patterns, educational procedures, institutions, and community organization. However, the community is an entity with pride and prejudice, with wealth and poverty, with needs and accomplishment, with lacks and superfluity, with ignorance and wisdom, and with weakness *and power,* in illness and in health. This is our patient. This is the patient for whom we must learn the art and the science of public health; upon whom we must practice the most modern and scientific diagnosis; and in whose interest we must improve our methods, measure and evaluate our techniques, and foster basic and applied research. This is the patient whose confidence, understanding, cooperation, and participation must be gained in each step and throughout the whole procedure.

This concept involves profound changes and advances that are more readily understood and grasped by medical men because of their experience in the evolution and developments of the past hundred years and because the medical terms and analogy of diagnosis and treatment are so helpful in determining wise policy and procedure and in answering the many problems that face them in the years ahead.

Knowledge of Community to Diagnose Ills

If we accept the community as our patient, we must recognize that the areas shown in the figure are not watertight compartments. Even though they are distinctive areas, with distinctive skills, a distinctive body of knowledge, and a distinctive competence, they are mutually supportive. Knowledge and information in one area are helpful to every other area; discovery in basic science aids clinical science and community health science and vice versa. The clinician is not a bacteriologist, but he frequently needs the aid of bacteriologists. Neither is the clinician a public health man.

We must recognize the important and equal part that other professions and other scientists must play in diagnosing and treating the "community patient." The community is much more complicated than an individual, just as the individual is more complicated than a bacterium. To diagnose community ills we must have knowledge of community economy—the distinctive skills of the economist, a knowledge of the social structure of the community, and a knowledge of the cultural patterns of the different groups of the community and the impact upon their health practices of nutritional patterns or recreational, religious, moral, and ethical patterns. Frequently this knowledge is necessary for varying groups within a community, and knowledge of the effect of these groups upon others in the community is needed.

We must have knowledge concerning community organization, power structure of the community, political structure, health laws and regulations, and attitudes that determine acceptance or rejection of change and development. We must have sophisticated knowledge of education and educational methods and of mores and morals that affect the growth and development of community consciousness and community action. These are not just words; they are the vast accumulation of knowledge of the social sciences. We must have knowledge of community measurements, of the demographic characteristics of our patient—the age, sex, racial distribution—and intricate ways in which this affects our patient's health; of the biostatistical techniques of collection and analysis of the data that can determine mass phenomena of disease and health; and of the geographical base that determines isolation, transportation, and resource. We must have the knowledge of sanitary science, technical skills that can determine oxygen demand or biological balance under widely varying circumstances. We must know the epidemiology of the mental health of the community and develop techniques to assess the early symptoms of community illness, physical or mental. We must have the knowledge of mass nutrition, mass disease, and epidemic phenomena that provides a scientific prognosis and plan of treatment or evaluation of the past or present programs aimed at control.

All of this is nothing more or less than a scientific approach to the diagnosis and treatment of the body politic—the history, physical examination, tests, analysis, clinical judgment, and prescription for treatment. The doctor has much to add to this team, because his knowledge of and approach to the individual are excellent background for this further training and experience upon the much more complex organism he now faces; but the doctor's supremacy is gone. A democratic team of individuals of diverse backgrounds and skills forms the profession of public health that must cope with a different kind of patient. The advances of health science and social science, not medical science alone, have shown us the way to immeasurably lift the health and wealth of our patient. But we must be free to develop and practice that science upon our patient, the community.

Concept of Public Health

If we accept this concept, we must recognize how profoundly this may affect public health practice. The first criterion of scientific versus empirical practice is a careful and complete history of the patient. What do you think of the doctor who does not take a history or does not ask what your trouble is or where your pain is but just gives you a pill? He is a quack or, if we feel charitable, he is too busy practicing medicine, "but not on us." Now, let us take a look at our health department. Do any or all of the team, that is the doctor of the body politic, have a complete history of the patient? Seldom, in a great many studies and surveys of local health departments and other health agencies, have I been able to obtain even an incomplete history of their patient. You may know how many immunizations you did, but do you know what percentage of the body politic under age 2 is protected against diphtheria, whooping cough, tetanus, or smallpox? Do you know what percentage of pregnant women are getting good, adequate medical supervision? We are full of data upon the indigent, upon this group, and upon that group, but we do not have a complete history. We do not even attempt to make it; we do not have the time.

Vital statistics is only a pitifully small segment of the health history of the individual or the body politic. We too frequently do not even know what other agencies, public and private, are doing for our patient—the community. Have you asked your patient what he thinks his chief complaint is? Does your patient have a way or means of expressing himself to you concerning his health? Your patient is all the people, not just the doctors, bankers, businessmen, or politicians. We must maintain and develop means of getting grass-roots answers, representative community opinion. If we are honest with ourselves, we will admit that a complete history of the health of the body politic is not available in most health departments, and certainly it cannot be had at a state or national level when it is not available at the local level.

The second criterion is a thorough examination of the whole patient. What do you think of the doctor who does *not* strip the baby for examination? Well, we do not take *our* children to him. With the health department it is hardly necessary to tell you that we do not examine the whole patient and seldom even a part of him. We have a good excuse—we do not have time; it would offend the medical profession if, for example, we determined the percentage of mothers getting poor prenatal care. So we cannot do that. The cold facts are a pretty bitter pill to swallow. We are responsible for the health of the body politic and we have never once examined the patient completely and thoroughly.

Along with this examination by the physician go certain laboratory tests, the third criterion. Advances in medical science provide new and essential tests for the individual constantly. This is one of the reasons for the increased cost of medical care. The advances in health science provide for new and essential tests upon the body politic to aid in determining community needs and lacks, a community diagnosis. Special tests on a mass basis are extremely expensive. Ingenuity reduces this expense; for example, from the large x-ray to the microphotograph, from $10 to 50 cents per person. We have done pretty well with this test, but we still have taken chest x-rays of only a part of our patient, unfortunately too often the most unlikely part. In many communities mass screening has been directed at the young adult population 15 to 35 years of age, where, following childhood, pulmonary tuberculosis is at its lowest incidence, and those over 55 years of age, who have six times as much active tuberculosis, are missed. Routine screening of all hospital inpatients and outpatients is still not generally done, although this is 10 times as productive a case-finding area as screening workers in industry. We have chosen to screen the Negro population in the United States instead of white population, despite the known greater prevalence rates of active tuberculosis in the white population at any one time. We have concentrated our efforts upon the 10% source of new cases and done nothing about the 90% source of new cases each year in most of tuberculosis control programs. If the doctor took x-rays of the long bones to discover tuberculosis, this would be more sensible than the mass screening that has so often been done by health departments, apparently avoiding the very segments of the body politic in which the disease is most common and prevalent.

This concept of public health requires a change of some other cherished, traditional ideas. We must recognize the existence of a distinctive profession of public health with a distinctive competence and body of knowledge, a profession requiring within its team structure the background skills and knowledges of many professions and sciences—natural sciences, physical sciences, and social sciences. We cannot continue to consider public health as a specialty of medicine, dentistry, engineering, statistics, nursing, education, or nutrition. It would be as logical for physicians to consider themselves primarily bacteriologists, biochemists, or physiologists specializing in clinical medicine. The focus is different; the patient is different. It is this difference in focus that has made the profession and provided it with distinctive skills, knowledge, and competence.

Practical Definition

Acceptance of this concept, then, clearly defines in a practical way what public health is and where it is going. It eliminates much of the fear and distrust of the medical profession, with all its ramifications. Fear and distrust are associated with a lack of knowledge of our objectives and goals—where we are going and whether in so going we will infringe upon the field of "their" professional eminence—the health of individuals. This definition not only says where we are going but it defines our areas of competence. It also accepts the physician's eminence and leadership in the field of individual health. It says to the physician, in essence, your job is to diagnose and treat the community, to determine its health needs—a field in which you are not qualified by your patient-centered training.

We will work on individuals only for the purpose of community health, except as the community demands that we as public servants do medical care of individuals. And this we will do under protest—that it is not our function, not public health, and as soon as it can be taken over by those whose responsibility is *individual* health, we wish to be relieved of it. We expect the right to examine our patient as you have the right to examine yours. If that examination reveals community need, say a low community immunity against diphtheria, we will assist the private physician in every way we can to do immunizations of individuals and will resort to health department clinics only as a stopgap, if the community immunity levels cannot be otherwise raised to a safe level. This is nothing new; we just have not said it clearly before and have left in the minds of the physicians the idea that we were going into the immunization business and other patient-centered business, which, unfortunately, too many health departments have done. By this answer we say clearly and firmly that public health is not the administration of medical care to individuals, indigent or otherwise, but we cannot avoid determining the need and adequacy of medical-care programs originating and functioning through the medical society and individual private physicians or government agencies. It is the fear that public health plans to take over individual health that makes medicine rightly suspicious of the whole public health program.

Acceptance of this concept will change the whole face of our primary problem of public health—the recruitment and training of public health personnel. Let us take, for example, one type of personnel, our greatest lack and shortage, the trained and qualified health officer. It has been wisely said that nothing is as important in recruitment of any profession as a challenge. I know the excuses, good excuses, of poor employment practice, inadequate compensation, and lack of professional recognition. They all play a part, but the reason we are not recruiting the cream of young physicians is that we have offered no challenge, no stimulating and daring future. Administration—paper work—does not appeal to a man faced with opportunity of service to the sick. The challenge of diagnosis is the real drawing card, the focusing all of his attention and his talents upon the discovery of disease and diagnosis of illness and its cure. If we could go to such young men and say, "Here is a new patient, infinitely more complex than the individual you will be working on, a science in its infancy compared with medical science, a patient needing diagnosis that demands all of your diagnostic acumen and then some, these are relatively unchartered seas with opportunities for human service and good much greater than anything you have dreamed of, here is a specialty that is dangerous because you will enter it with no 'God-given authority' and 'supremacy,' you will earn your leadership if you have it in you, here your successes and failures are not counted in scores but in thousands and hundreds of thousands"—by this kind of challenge we could begin to skim the cream from the top instead of scraping unsuccessfully the bottom of the barrel. But we dare not, in good faith, make this challenge until we accept this answer that clearly places us in the limited specialty position, with responsibility for the diagnosis and treatment of the body politic. The smart young men of medicine will not be sucked in by the glittering generalities that public health is everything, or the reverse, that it is limited to administrative boredom.

Comment

It is high time public health grew up and defined clearly its objective, purpose, function, competence, and distinctive skills and body of knowledge in terms that can be clearly understood by itself, other professions, and the public. This concept of public health as the scientific diagnosis and treatment of community health needs and status, this concept of the community as the patient of public health, does just that. The growing and rapid acceptance of this concept within the public health profession augurs well for everyone concerned. Let us, however, remember that it took at least 50 years for complete acceptance of each of the profound changes of health science in the past. We must not expect a miraculous acceptance of this last profound change.

The emerging science of public health demands daring leadership that is not afraid to come forth from the basic professions from which it came into the new profession of public health—leadership that is challenged by the difficulties of education in a new profession, that is challenged by virgin territory of community research opening up before us—leadership that can direct, through competence in public health, the team of professional equals that is the doctor of the body politic. Medical men must either accept this challenge or see others take over the leadership that could have been our own.

CLINICAL NOTES

SPONTANEOUS HEMORRHAGES CAUSED BY PLASMA-THROMBOPLASTIN-ANTECEDENT DEFICIENCY

REPORT OF A CASE

Edward I. Henry, M.D.
Robert L. Rosenthal, M.D.
and
Irwin Hoffman, M.D., New York

An increasing number of hereditary hemorrhagic diseases caused by deficiencies in plasma clotting factors has been recognized in recent years. In addition to classic hemophilia or antihemophilic globulin deficiency, two other similar diseases have been described: plasma-thromboplastin-component deficiency, or Christmas disease,[1] and plasma-thromboplastin-antecedent deficiency.[2] In comparison with antihemophelic-globulin and plasma-thromboplastin-component deficiencies, hemorrhagic manifestations have been generally less severe in plasma-thromboplastin-antecedent deficiency. Spontaneous hemorrhage has been rare.

Table 1.—*Coagulation Studies in Patient with Plasma-Thromboplastin-Antecedent Deficiency*

Study	Finding	Normal Values
Bleeding time, min	0	0 — 3
Tourniquet test	Very slightly positive	......
Coagulation time, min	9	5 — 11
Heparin clotting time, min	26	20 — 35
Clot retraction	Present	......
Prothrombin time, sec	14	14 (control)
Serum prothrombin time, sec	8	Over 24
Platelet count, per cu mm	180,000	150,000 — 300,000

This paper presents an unusual case of plasma-thromboplastin-antecedent deficiency in which spontaneous cerebral hemorrhage produced bizarre neurological symptoms. The prompt disappearance of symptoms after the administration of plasma emphasized the importance of establishing the diagnosis of plasma-thromboplastin-antecedent deficiency.

A 38-year-old housewife had an extensive history of abnormal bleeding. At the age of 17, she had had severe postpartum bleeding. At the age of 28, she required five blood transfusions for hemorrhage after mastoid surgery Three years before the present studies, she bled profusely for three days after a tooth extraction and was reprimanded by her dentist for "not telling me you are a bleeder." For one year she had noted large subcutaneous ecchymoses appearing spontaneously or after slight trauma, and for several months her menstrual periods had been unusually heavy. There had been no history of epistaxis, hematuria, gastrointestinal bleeding, or hemarthrosis.

Routine physical examination, complete blood cell count, urinalysis, chest x-ray, and electrocardiogram were all normal. Blood coagulation studies, shown in table 1, revealed normal values except for an abnormal serum prothrombin time, indicative of a clotting defect. In order to elucidate this defect, further match-

---

From the Department of Medicine, the Long Island Jewish Hospital (Drs. Henry and Hoffman), and the Beth Israel Hospital, Levy Foundation (Dr. Rosenthal).

ing studies were performed as shown in table 2. These revealed that the clotting defect was corrected by plasma deficient in antihemophilic globulin and plasma thromboplastin component, by normal serum, and by plasma and serum treated with barium sulfate. It was not corrected by plasma deficient in plasma thromboplastin antecedent. In addition, the patient's plasma after storage at −15 C for three months provided only minimal correction of blood deficient in plasma thromboplastin antecedent. These studies established the diagnosis of this deficiency, and the patient was told she had a clotting abnormality.

TABLE 2.—*Blood-Matching Studies on Patient with Plasma-Thromboplastin-Antecedent Deficiency*

1 Cc. Patient's Blood Plus 0.1 Cc. of	Clotting Time, Min.	Serum Prothrombin Time, Sec. 2 Hr.	Serum Prothrombin Time, Sec. 24-Hr.	Correction*
0.85% sodium chloride	9	8	17	0
Plasma deficient in antihemophilic globulin	5	23	32	++
Plasma deficient in plasma thromboplastin component	5	20	26	++
Plasma deficient in plasma thromboplastin antecedent	7	10	18	0
Normal barium sulfate-treated plasma	7	18	29	++
Normal barium sulfate-treated serum	5	25	42	+++
Normal serum	6	28	42	+++

In August, 1955, two weeks after an unusually heavy menstrual period, she was admitted to Long Island Jewish Hospital because of ataxia, vertigo, and diplopia of five days' duration accompanied by nausea and vomiting. There had been no headache, fainting spells, convulsions, paresthesias, motor weakness, or sphincteric disturbance. Physical examination revealed the following positive findings: temperature 100.4 F (38 C); pulse rate 74 per minute and regular; and blood pressure 120/80 mm. Hg. Weakness of conjugate gaze in the right eye was greater in looking to the right and weakness in conjugate gaze in the left eye was greater in looking to the left, with unsustained horizontal nystagmus in both. There was unsustained vertical nystagmus on upward gaze, with none on downward gaze. Convergence was good. Diplopia was present in all fields, including direct-forward gaze. The impression was of a bilateral sixth cranial nerve paresis with paretic nystagmus. Peripheral and central visual fields were normal. There was an unsteady broad-based gait. Deep tendon reflexes in the upper extremities were hyperactive and equal; knee and ankle jerks were depressed to absent. An equivocal Babinski's sign was found bilaterally. The function of the remaining cranial nerves was intact. No motor weakness or incoordination of the extremities was demonstrated. Sensation was intact. Injecting cold water into the right ear produced slight vertigo with no past pointing or change in nystagmus; a similar injection into the left ear caused moderate vertigo with past pointing to the right and accentuation of the nystagmus on gazing to the left. A lumbar puncture was performed. No cells were present, the protein level was 22 mg. per 100 cc., and the spinal fluid pressure was 120 mm. H_2O. The urine and a hemogram were normal

In view of the possibility of cerebral hemorrhage, the patient was given 400 cc. of type-specific (A_1 Rh-positive) bank plasma on the day following admission. Large doses of vitamins B and C were also administered because of a moderate alcoholic background. Within a few hours, the ataxia, diplopia, and vertigo, as well as the extraocular muscle palsy, had dramatically disappeared, with only unsustained nystagmoid movements remaining. There was no change in reflexes of the lower extremities. The patient remained well and was discharged within a few days.

After discharge from the hospital, the patient was observed frequently, and oral and parenteral therapy with vitamins was continued. She remained well and free of ecchymoses for about one month, until her next menses. At this point, spontaneous subcutaneous ecchymoses appeared and her menstrual period was still heavy after a 10-day flow. She was readmitted to Long Island Jewish Hospital for transfusions. On that admission, the coagulation time and the Rumple-Leede phenomenon (minute subcutaneous hemorrhages) were normal. The day after the administration of 1,000 cc. of whole blood the vaginal bleeding ceased and the patient was discharged. The decision was then made to administer 1 unit of plasma monthly a week before her expected menses in order to prevent further dangerous bleeding Four menses have passed without incident on this regimen

Comment

Bleeding in patients with hereditary hemorrhagic diseases caused by plasma-protein deficiencies is usually related to trauma. This is particularly true in plasma-thromboplastin-antecedent deficiency, in which the bleeding manifestations have been relatively mild in comparison with those in antihemophilic-globulin and plasma-thromboplastin-component deficiencies The patient reported here presented episodes of bizarre cerebral symptoms and ecchymoses that responded dramatically to treatment with plasma. In addition, the patient had frequent menorrhagia that could be prevented by plasma infusions. These patterns of bleeding have been unusual in our experience with plasma-thromboplastin-antecedent deficiency, based upon 35 cases.[3] Because of its mildness and mode of inheritance as an autosomal dominant characteristic, it is expected that plasma-thromboplastin-antecedent deficiency will become a relatively frequent finding.

It must be emphasized that in the mild to moderate degree of plasma-thromboplastin-antecedent deficiency, the routine bleeding and clotting test are normal. The serum prothrombin time or prothrombin-consumption test may be the only demonstrabl abnormality. This test sensitively reflects abnorma blood thromboplastin formation from its precursor with subsequent diminished conversion of prothrombin to thrombin. The formation of a firm clot, a measured by the clotting time, is not a sensitive test because it requires only minute amounts of thrombin A shortened serum prothrombin time thus indicates incomplete prothrombin consumption during clot formation.[4] Matching studies are necessary in order to identify the exact deficiency. This is possible because of the different properties of antihemophilic globulin, plasma thromboplastin component, and plasma thromboplastin antecedent.[5] These tests measure correction of the defect as shown in table 3.

TABLE 3.—*Correction of Deficiency States*

Deficiency	Corrected by: Normal Serum	Absorbed Barium Sulfate Plasma	Plasma Deficient in Antihemophilic Globulin	Plasma Deficient in Thromboplastin Antecedent	Plasma Deficient in Thromboplastin Component
Antihemophilic globulin	No	Yes	No	Yes	Yes
Plasma thromboplastin antecedent *	Yes	Yes	Yes	No	Yes
Plasma thromboplastin component	Yes	No	Yes	Yes	No

* This deficiency was found in our patient

Treatment depends upon the specific deficiency. In antihemophilic-globulin deficiency, administration of fresh plasma or blood, if anemia has developed, is essential. However, in plasma-thromboplastin-component and plasma-thromboplastin-antecedent deficiencies, stored plasma or blood is satisfactory and possibly preferable. In the present case, stored bank blood and plasma were effective in both stopping and preventing hemorrhage.

Summary

In a case of plasma-thromboplastin-antecedent deficiency with unusual features of brain-stem bleeding, cutaneous ecchymoses, and recurrent menorrhagia, successful therapy of the acute bleeding and prevention of further episodes were accomplished with administration of stored plasma and bank blood.

Addendum

In February, 1956, after receiving one unit of banked plasma, the patient underwent extraction of three teeth without operative or postoperative bleeding.

This study was supported by a grant from the National Institutes of Health, U. S. Public Health Service.

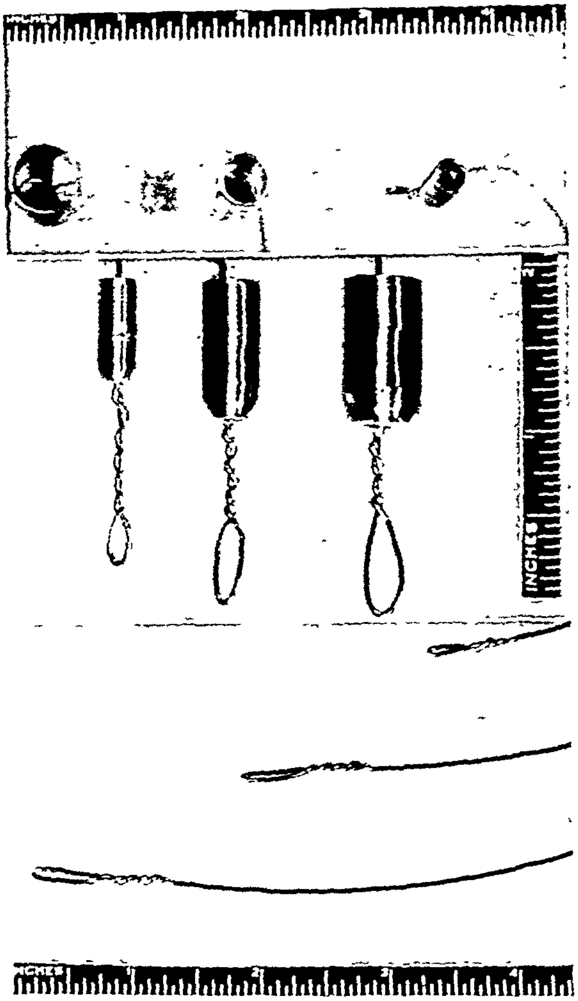
Prophylactic Use of Antibiotics.—There is no justification for prophylactic antibiotic therapy in patients with clean, uncontaminated wounds resulting from elective surgery, i. e., breast biopsy or herniorrhaphy. Every surgeon should be honest enough with himself to realize that more wound infections occur in wounds because of rough handling of tissues, indiscreet use of suture material and the failure to remove devitalized tissue, than from the lack of specific supportive and antibacterial therapy.

Certain dangers are associated with the use of the antibiotics. The indiscriminate use of antibiotics is unnecessarily sensitizing an alarmingly large number of patients. A patient may later develop a serious infection and he may be denied a specific and possibly a life-saving antibiotic because he became sensitive to that antibiotic used by a physician who wanted to demonstrate that he was doing everything possible to prevent infection, in spite of the lack of any evidence to indicate the usefulness of an antibiotic in *such a situation.* Indiscriminate use of antibiotics (more than half of hospitalized patients now receive antibiotics) also tends to increase antibiotic resistance of the bacteria of our environment. For instance, the average of reported incidences of penicillin-resistant virulent streptococci has increased 1,640 per cent in the past 12 years—from 4 per cent to 65.5 per cent.—H. A. Zintel, M.D., Asepsis and Antisepsis, *The Surgical Clinics of North America,* April, 1956.

IMPROVED VEIN STRIPPER

Frederick G. Stoesser, M.D., Buffalo

Experience over the past 24 years with some 3,000 vein operations has led me to the conclusion that vein stripping is far superior to single or multiple vein ligations in the treatment or eradication of varicose veins. However, the available vein strippers have several disadvantages; namely, (1) the necessity of using a large bulb in order to obviate the tendency for the vein to turn inside out and tear during the procedure, (2) the necessity of ligating the vein to the stripper to prevent inversion, and (3) the time required to remove the vein from the stripper. In an attempt to overcome these disadvantages, the vein stripper to be described here was devised. I used this type of stripper on over 100 vein operations between February, 1955, and March, 1956, and found that it makes the procedure of vein stripping not only less tedious but also more complete.



Vein stripper. *Top,* strand of tempered stainless steel wire is passed through hole drilled in solid metal cup. *Center,* wider loop of wire is placed against the solid end of the cup. *Bottom,* narrower loop becomes probing end of wire.

The stripper end consists of a metal cup or bucket constructed from stainless steel shaft material. Three different-sized shafts are used: ¼ in. in diameter by ⅝ in. long, ⅜ in. in diameter by ¾ in. long, and ½ in. in

---

From the Department of Surgery, Millard Fillmore Hospital.

diameter by ⅞ in. long. The cup is formed by drilling out the center of the shaft one-half of its length, using a 3/16-in. drill for the smallest cup, a 5/16-inch drill for the medium-sized cup, and a 7/16-inch drill for the largest size. This leaves a rim to the cup that is 1/32 in. in thickness. A hole 0.058 in. in diameter is then drilled through the center of the remaining solid metal, through which a strand of tempered stainless steel wire 0.037-in. in diameter is passed (see figure, *top*). Each end of the wire is doubled on itself and tightly twisted to form a loop, the loops being ⅛ and ¼ in. in diameter respectively. The wider loop is placed against the solid end of the cup (see figure, *center*), and the narrower loop becomes the probing end of the wire (see figure, *bottom*). This type of tip construction facilitates the passage of the stripper into and through smaller veins. A 14-in. wire is used for the small cup and a 34-in. wire for the two larger cups. The solid end of the cup is rounded off (see figure, *center*).

Procedure

An oblique incision is made over the fossa ovalis, and the saphenous vein and its branches are isolated, transected, and ligated close to the femoral junction, care being taken to avoid drawing a portion of the anterior wall of the femoral vein up into the ligature. A clamp is left on the distal severed end of the long saphenous vein, and this area is temporarily covered with a sponge. A transverse incision, 1 in. long, is then made just anterior to the medial malleolus. The long saphenous vein is transected at this point and the distal end tied. The edges of the proximal end of the vein are grasped with two mosquito hemostat forceps, and the wire of the medium or large stripper is passed into the lumen of the vein. The large size is used only on unusually large veins.

Frequently the stripper can be passed all the way from the malleolus to the groin, passage being facilitated by rotating the wire to change the direction of its curve, thus bypassing pockets, or sacculations. The clamp is removed from the proximal end of the saphenous vein, and, when the stripper wire projects from the open end of the vein, the wire is grasped with a Kocher clamp and drawn cephalad. This causes the proximal end of the saphenous vein to fall into the cup and pucker on the wire, thereby preventing inversion of the vein and also effecting its complete removal.

If the stripper fails to pass the entire length of the long saphenous vein it is usually because there has been a previous phlebitis in this area. In these instances one or two additional incisions are made at the midthigh, knee, or midcalf level. Additional varicosed branches are also removed through such incisions. The short saphenous vein is always removed to prevent the likelihood of recurrences, two incisions being made for this purpose—one over the popliteal area and the other just posterior to the lateral malleolus. The small stripper with its short wire is used, and the vein is usually extracted toward the foot.

Care must be taken to assure that the proper end of the stripper wire is passed into the vein, so that the cup and not the rounded end of the stripper will gather the vein as it is removed. If this is not done the vein will have a tendency to stretch and slide over the stripper, which often occurs with other types of strippers. Removal of the stripped vein from the instrument is then easily accomplished by passing the cup to the opposite end of the wire, thus causing the stripped vein to drop off into the specimen dish.

The operation is done with the patient under general anesthesia. The operating table is tilted slightly in a modified Trendelenburg position in order to decrease the venous pressure in the legs and minimize blood loss. The wounds are closed with interrupted cotton sutures, and, after dressings have been applied, the leg is wrapped from toe to upper thigh with an elastic bandage. When the patient is transferred to the recovery room and later to bed, his feet are elevated 15 to 18 in. and kept in this position until the following morning. On the first postoperative day the foot of the bed is leveled and the patient is allowed to be up and about. The elastic bandages together with the sutures are removed at the end of a week.

Summary

From February, 1955, to March 1956, over 100 vein operations have been done using a new type of vein stripper. This stripper has been found to be more efficient than instruments previously used because of the following advantages: 1. It prevents the stripped vein from inverting on itself and breaking. 2. The edge of the cup tends to shear off the perforating veins rather than tearing them from their attachment to the deep veins. 3. The stripped vein is removed easily and quickly from this instrument. 4. The stripper and technique described have materially shortened the operating time and given more satisfactory results.

Cystitis Emphysematosa.—Vesicles of gas within the urinary bladder wall are infrequently seen. Eisenlohr in 1888, first described this condition as an autopsy finding. Mills in 1930, based on a series of 12 cases, expressed the belief that this is not only a postmortem phenomenon but one that occurs during life. Ravich and Katzen in 1932, proved him to be correct. An emergency cystotomy in a fifty-six year old male revealed the vesicles within the bladder wall. Since then 22 other cases have been recognized during life and reported, the most recent by Faingold, Hansen and Rigler, Wheeler, and Packard, Beazlie and Creecy. About one-half of these were diagnosed roentgenographically. The cause of cystitis emphysematosa is a gas producing organism, Escherichia coli being found frequently, and Clostridium welchii occasionally. The condition occurs in both sexes, predominantly in adults; one case has been reported in infancy. More than one-half of the patients reported in the literature had had diabetes, which apparently is a predisposing factor. The most common symptoms of cystitis emphysematosa are frequent urination and dysuria, and occasionally hematuria and pneumaturia; however, in some cases no symptoms referable to the urinary bladder were present. —P. Francke Jr., M.D., and J. W. Lane, M.D., Cystitis Emphysematosa, *The American Journal of Roentgenology, Radium Therapy and Nuclear Medicine*, May, 1956.

COUNCIL ON PHARMACY AND CHEMISTRY

NEW AND NONOFFICIAL REMEDIES

Monographs and supplemental statements on drugs that appear in this column have been authorized by the Council for publication and inclusion in New and Nonofficial Remedies. They are based upon the evaluation of available scientific data and reports of investigations.
H. D. Kautz, M.D., *Secretary*

Decamethonium Bromide.—Decamethylenebis (trimethylammonium bromide).—The structural formula of decamethonium bromide may be represented as follows:

$$(CH_3)_3\overset{+}{N}-(CH_2)_{10}\overset{+}{N}(CH_3)_3 \qquad 2Br^-$$

Actions and Uses.—Decamethonium bromide, a synthetic quaternary ammonium compound, is a potent skeletal muscle relaxant. Like tubocurarine, it blocks motor impulses at the myoneural junction but is about three times as potent in this respect as equal amounts of tubocurarine. After intravenous administration, muscle relaxation becomes apparent within 1 minute and is maximal at 3 to 4 minutes. Muscle activity begins to return after 8 to 10 minutes and has usually returned to normal after 20 to 30 minutes. Thus, the duration of action of decamethonium is intermediate between that of tubocurarine and succinylcholine, being more fleeting than that of the former but more persistent than that of the latter. Unlike tubocurarine, the drug does not produce histamine-like effects (bronchospasm and laryngospasm), nor does it cause ganglionic blockade. Any effects on pulse and blood pressure are not due to decamethonium per se but develop secondarily as a result of inadequate ventilation during respiratory depression or apnea. Decamethonium does not potentiate or act synergistically with ether or any of the commonly employed anesthetic agents. No cumulative effects are noted after repeated administration; on the contrary, tachyphylaxis (decreased effectiveness with repeated administration of the same dose) has been observed.

Decamethonium bromide effectively produces muscle relaxation during surgical procedures carried out with the patient under general anesthesia. The drug also is useful for facilitating endotracheal intubation or as an adjunct in electroconvulsive therapy.

Respiratory depression, which can occur after the administration of all myoneural blocking agents, is also a potential danger with decamethonium, especially in the deeper planes of anesthesia. Current evidence indicates that both the morbidity and mortality associated with the use of decamethonium and tubocurarine are identical. The anticholinesterases and edrophonium chloride are of no value as antagonists to overdosage; therefore, it is essential that facilities for controlled respiration and oxygen administration be immediately available when the drug is used.

Dosage.—Decamethonium bromide is administered by single intravenous injection, which may be repeated as necessary. Since the drug is miscible with thiopental sodium, it is sometimes administered in combination with this agent for the induction of anesthesia. The response to decamethonium varies greatly from patient to patient. Doses that are suboptimal for some may cause respiratory depression in others; therefore, dosage must be individually determined. The usual dose varies from 0.5 to 3 mg., depending on the individual response and the degree of relaxation desired. The response to the drug is quite reproducible in a given patient from day to day.

Preparations for use as stated for the foregoing drug are marketed under the following name: Syncurine.

Burroughs Wellcome & Co., Inc., cooperated by furnishing scientific data to aid in the evaluation of decamethonium bromide.

Use of Bethanechol Chloride for Paralytic Ileus and Urinary Retention After Ganglionic Blockade

The Council has evaluated the additional use of the parasympathomimetic (cholinergic) agent bethanechol chloride for the treatment of paralytic ileus and urinary retention caused by the parasympatholytic action of certain ganglionic blocking agents used in the treatment of hypertension. These complications can result from hypersensitivity to the drugs, overdosage, or, in the case of ileus, inadequate dietary and/or laxative management. Bethanechol previously has been described as useful for the treatment of postoperative abdominal distention and paralytic ileus, and also for neurogenic atony of the urinary bladder with retention. On the basis of currently available information, the Council further concluded that it is helpful in aborting or relieving intestinal stasis and urinary retention caused by ganglionic blockade. The blocking agents against which it is useful include the salts of hexamethonium and mecamylamine hydrochloride. Whenever possible, cholinergic therapy with bethanechol chloride should be initiated before the appearance of acute symptoms.

For these indications, bethanechol chloride may be administered orally, sublingually, or subcutaneously (never intramuscularly or intravenously), the oral or sublingual route being preferred unless symptoms are unusually severe. Dosage must be individualized according to severity of symptoms and degree of response. The administration of 10 mg. orally or sublingually three times daily appears to be the most commonly employed dosage. The usual subcutaneous dose is 5 mg.; however, since some patients may experience side-effects and respond to as little as 2.5 mg., the latter should be used as an initial parenteral dose and the minimum effective dose determined for each patient by observing the response to injections at intervals of 15 to 30 minutes.

The Council voted to amend New and Nonofficial Remedies to describe this additional use of bethanechol chloride.

Merck Sharp & Dohme, Division of Merck & Co., Inc., cooperated by furnishing scientific data to aid in the evaluation of the use of bethanechol chloride for paralytic ileus and urinary retention after ganglionic blockade.

PRURITUS ANI

Although often considered a minor ailment, especially by those not afflicted with it, pruritus ani is at best a source of great annoyance and embarrassment and at worst may become so distracting as to result in suicide. Because the perianal skin is rich in sensory nerve endings, it is particularly liable to itching. If the itching is persistent, progressive skin changes leading to lichenification occur. According to Fromer,[1] pruritus is a modified sensation of pain and, although produced by a weaker stimulus than pain, it may be more intolerable than the pain produced by a stronger stimulus. This is the basis for scratching, which by denuding the skin substitutes tolerable pain for itching. There is some question as to whether an idiopathic form of pruritus ani exists or whether all perianal itching is secondary to some cause that in the idiopathic case is not readily discoverable. Copland[2] has classified the known causes as intestinal parasites; fungi; psychosomatic conditions associated with nervous tension; digestive disorders; vitamin deficiency; menopause; diabetes; local diseases of the anus, rectum, vagina, and vulva; and allergy. Food allergies and direct contact with various irritants are hard to rule out. Sulfonamides, antibiotics, and local anesthetics of the "caine" type are highly sensitizing in some patients. Psychosomatic influences may be contributory, but Fromer does not believe they are directly causal.

Before any rational treatment can be prescribed, a thorough search should be made for the cause. When a local anorectal disease such as a draining sinus, hemorrhoidal prolapse, or anal fissure appears to be the cause, surgical intervention is indicated. Scratching and the previous application of various drugs often confuse the picture and make this more difficult. Rath[3] recommends avoiding soap (except castile), cleansing the area with clear water, and drying with soft tissue. Frykman[4] advocates applying petroleum jelly before bathing to prevent maceration of the skin. After a bowel movement soft tissue should be used. If the patient is forced at times to use hard or rough toilet paper, he should rumple it thoroughly and moisten it before using. Better yet, he should carry soft tissue with him. Although all authorities admonish patients against scratching, this is exceedingly difficult in practice; even if the patient controls the impulse to scratch when he is awake, there is no assurance that he will not scratch during sleep. Keeping the fingernails clean and short will help to prevent infection and undue trauma. Tight clothing should be avoided, especially in hot weather, as anything that inhibits free evaporation of perspiration may aggravate the condition. Fromer states that direct relief of itching is difficult but that relief may be obtained indirectly by substituting a sensation of pain, heat, or cold. For therapeutic purposes cold is best and may be effected through the use of wet dressings. Care must be taken, however, to avoid using them to the point of macerating the skin. Leifer[5] states that if the itching has been aggravated by inept or injudicious treatment the physician must forget the cause of the itching and treat the skin until the dermatitis is under control.

It is important also to consider the state of mind of the patient, because this disease may destroy morale and produce profound depression or drive the patient into complete seclusion. It may be necessary to prescribe salicylates or barbiturates. Morphine should be avoided, but if the patient's morale is low one of the new tranquilizers may help. Spiced foods and alcohol should be avoided, and Frykman[4] advocates taking buttermilk, cottage cheese, and acidophilus tablets. Various local applications have been used with moderate success, notably 0.5% menthol and/or 0.5% phenol in a lotion or greaseless cream. Local application of local anesthetics has no effect, because these drugs do not penetrate the unbroken skin. Antihistamines likewise are of no value when applied locally. With the discovery of hydrocortisone a great advance was made in the treatment of this condition. After the patient obtains initial relief from the application of a 1 or 2% hydrocortisone ointment, this treatment should be continued for about 10 days. Apparently a few patients can taper off such treatment and have no recurrence, but in most patients the treatment is an effective means of symptomatic relief rather than a cure[6] and in a few the effectiveness of the treatment is quickly dissipated. The effect is sometimes enhanced by giving corticotropin or cortisone by mouth. Frank and Stritzler[7] observed that the results with the topical application of a 0.25% prednisolone ointment were good but inferior to those with hydrocortisone. According to Turell,[6] steroid hormones suppress itching if it is accompanied by cutaneous changes but not if it is caused by diarrhea, antibiotic treatment, or irritating anorectal discharges. When other methods of local treatment have failed, irradiation with grenz rays may be tried. These rays are not so likely to harm the reproductive cells as are x-rays. Although some physicians still advocate alcohol injection with or without an undercutting operation (neurotomy) in the treatment of obstinate cases, others have abandoned such procedures because they have found the results to be temporary and recurrence the rule.

WELCOME TO SEATTLE

Seattle has been said to be the most beautiful city in America and the largest city of its age (87 years) in the world. These complimentary statements are especially inviting to physicians and their families to attend the Clinical Session of the American Medical Association Nov. 27-30. The beauty of Seattle stems in part from its location on a series of hills overlooking a wealth of waterways, creating superb scenic drives, while the nearby sprawling forest provides a pleasant fragrance of Douglas fir. Here is a labyrinth of lakes, bays, canals, bridges, and beaches. About the city is a majestic natural framework of mountains, lakes, bays, and beaches. To the south is Mount Rainier, whose white glaciers shimmer in the distance the year around. To the north and east are the Cascade mountains and towering Mount Baker, and to the west are the snow-capped Olympics silhouetted by the setting sun. Truly, nature's splendor here has reached its height.

Seattle, which has been called the "City on Water," lies between the salt waters of Puget Sound and the 24-mile long fresh waters of Lake Washington, and these two great bodies of water are linked by Lake Union and the ship canal. Salt water and fresh water beaches beckon on every hand, while pleasure boats go by. As Seattle has more small-craft ownership per capita than any other city, sailing regattas and boating thrill skippers and spectators alike. To those who love the sea, Seattle offers enchanted hours. Ships from many nations unload cargoes from faraway ports. Ferryboats fan out in all directions. Elliott Bay, the natural harbor, is just 125 miles from the Pacific Ocean and is the closest large American port to Alaska and to the markets of the Orient. Seattle is 111 miles south of the Canadian border, 692 miles from San Francisco, and 1,753 miles from Chicago. Its outer and inner harbors total 197 miles of water front.

Educational and Cultural Institutions

The 600-acre campus of the University of Washington in Seattle, in a setting on the shore of Lake Washington and Lake Union, is one of the largest in the United States. The new university buildings and those of the medical school blend with these beautiful surroundings. In the Seattle Art Museum are outstanding collections, including European and American art and priceless Chinese jades. The Washington State Museum features Northwest Indian art and culture, animals, and a world-renowned rock collection. The Henry Art Gallery shows frequently changing exhibits of contemporary paintings, sculpture, printmaking, and the crafts. The Arboretum is a unique park of 267 acres with more than 2,000 species of trees, shrubs, and plants from all over the world. There is also the Frye Art Museum.

The Seattle Symphony Orchestra, which brings the best in music to local schools and to families through neighborhood concerts, has received national recognition through radio and television broadcasts. Interest in music is widespread in Seattle, and leading artists present concerts sponsored by various groups throughout the year. Amateur theatricals flourish, and the university's Penthouse and Show Boat Theatres provide opportunities for professional training and contribute to the entertainment offered by the legitimate theaters.

Seattle's Public Library has almost a million books and is close to the everyday life of the citizens. In addition to the central library downtown, there are 15 branch libraries, 2 mobile branches, a library for the blind, and 9 deposit stations. About 3,420,000 volumes circulate during the year for home reading. Seattle is a city of home owners, with 70% owner-occupied dwellings, many with beautiful gardens.

Churches and Hotels

Seattle has 428 churches including all major denominations. Recently a great church-building boom has given the city many handsome new edifices. There are 425 hotels and motels where the rates charged are suited to every budget. Experts are said to rate Seattle in the top ten restaurant cities. Specialty eating places offer a variety of culinary attractions. Fresh seafood and the fresh fruits, vegetables, and dairy products produced in this area aid in this high rating.

Transportation Facilities

Four transcontinental railroads—the Union Pacific, the Northern Pacific, the Great Northern, and the Chicago, Milwaukee, and St. Paul—serve Seattle, as do more than 100 motor freight lines and two motor coach lines. Seattle is easily accessible by automobile; U. S. 88, the Pacific Coast Highway, and U. S. 10, the main North-West highway, pass through the city; and ferries connect it with many islands in Puget Sound and Victoria, B. C., Canada. The largest floating structure in the world, Lake Washington's floating bridge, spans the lake from Seattle to Mercer Island, and preliminary surveys are under way for a floating bridge across Puget Sound. Plans are being drawn for a second floating bridge across Lake Washington.

Climate

The summers are cool, the winters mild, and the air is clear, clean, and healthy. The average summer temperature is about 64 degrees and the average winter temperature about 43 degrees. The average annual rainfall is 32 in., which is 10 less than that of New York City, 6 less than that of St. Louis, and 31 less than that of New Orleans. Most of Seattle's rain falls in December and the least in July. Lying between two mountain ranges, Seattle is protected against climatic extremes, and it is close enough to the Pacific Ocean to enjoy the warm sea breezes. An author is said to have written that "Seattle's climate is air-conditioned, blending the air of mountain, sea, and forest."

THE CLINICAL MEETING

AMERICAN MEDICAL ASSOCIATION

Seattle, Nov. 27-30, 1956

OFFICIAL CALL

TO THE OFFICERS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The Clinical Meeting of the American Medical Association will be held in Seattle, Nov. 27-30, 1956.

The House of Delegates will convene at 10 a. m., Tuesday, Nov. 27, in the Spanish Ballroom of the Olympic Hotel. In the House the representation of the various constituent associations for the clinical meeting in 1956 is as follows:

Alabama	2	Maine	1
Alaska	1	Maryland	2
Arizona	1	Massachusetts	6
Arkansas	2	Michigan	6
California	14	Minnesota	4
Colorado	2	Mississippi	2
Connecticut	3	Missouri	4
Delaware	1	Montana	1
District of Columbia	2	Nebraska	2
Florida	3	Nevada	1
Georgia	3	New Hampshire	1
Hawaii	1	New Jersey	6
Idaho	1	New Mexico	1
Illinois	10	New York	18
Indiana	4	North Carolina	3
Iowa	3	North Dakota	1
Isthmian Canal Zone	1	Ohio	8
Kansas	2	Oklahoma	2
Kentucky	2	Oregon	2
Lousiana	2		

Pennsylvania	11	Utah	1
Puerto Rico	1	Vermont	1
Rhode Island	1	Virginia	2
South Carolina	2	Washington	3
South Dakota	1	West Virginia	2
Tennessee	3	Wisconsin	4
Texas	7	Wyoming	1

The scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy, the Medical Corps of the Air Force, the Public Health Service, and the Veterans Administration are entitled to one delegate each.

The scientific meetings and the scientific and technical exhibits will be held in the Civic Auditorium.

The Opening General Assembly will start at 9:30 a. m., Tuesday, Nov. 27.

The Scientific Program will open Tuesday, Nov. 27, starting at 10:30 a. m., and will continue throughout the afternoon of that day. The program will continue on Wednesday and Thursday mornings and afternoons, Nov. 28 and 29, and on Friday morning, Nov. 30, closing at 12 noon.

The Registration Bureau, which will be located in the Civic Auditorium, will be open from 8:00 a. m. until 5:30 p. m., Tuesday, Nov. 27, from 8:30 a. m., to 5:30 p. m., Wednesday, and Thursday, Nov. 28 and 29, and from 8:30 a. m. to 12:00 noon, Friday, Nov. 30.

Dwight H. Murray, President.
E. Vincent Askey, Speaker, House of Delegates.
George F. Lull, Secretary.

OFFICERS OF THE AMERICAN MEDICAL ASSOCIATION, 1956-1957

President—Dwight H. Murray, Napa, Calif.

President-Elect—David B. Allman, Atlantic City, N. J.

Vice President—F. S. Crockett, West Lafayette, Ind.

Secretary and General Manager—George F. Lull, Chicago.

Assistant Secretary—Ernest B. Howard, Chicago.

Treasurer—J. J. Moore, Chicago.

Speaker, House of Delegates—E. Vincent Askey, Los Angeles.

Vice Speaker, House of Delegates—Louis M. Orr, Orlando, Fla.

Editor—Austin Smith, Chicago.

Business Manager—Mr. Thomas R. Gardiner, Chicago.

Board of Trustees—J. R. Reuling, Windermere,
Fla., 1957; J. R. McVay, Kansas City, Mo.,
1957; E. S. Hamilton, Kankakee, Ill., 1958; G.
Gundersen, Chairman, La Crosse, Wis., 1958;
H. H. Hussey, Washington, D. C., 1959; F. J.
L. Blasingame, Wharton, Texas, 1959; L. W.
Larson, Bismarck, N. D., 1960; T. P. Murdock,
Meriden, Conn., 1960; J. P. Price, Florence,
S. C., 1961, the President; the President-Elect;
and, ex officio, the Vice President, Treasurer,
Speaker and Vice Speaker of the House of
Delegates.

STANDING COMMITTEES OF THE HOUSE OF DELEGATES

Judicial Council—H. L. Pearson Jr., Chairman,
Miami, Fla., 1957; G. A. Woodhouse, Pleasant
Hill, Ohio, 1958; J. M. Hutcheson, Richmond,
Va., 1959; L. A. Buie, Rochester, Minn., 1960;
R. Ward, San Francisco, 1961; G. F. Lull,
Secretary, Chicago.

Council on Medical Education and Hospi-
tals—F. D. Murphy, Lawrence, Kan., 1957;
H. G. Weiskotten, Chairman, Skaneateles,
N. Y., 1957; V. Johnson, Rochester, Minn.,
1958; L. S. McKettrick, Brookline, Mass.,
1958; C. T. Stone Sr., Galveston, Texas, 1959;
W. A. Bunten, Cheyenne, Wyo., 1959; J. M.
Faulkner, Cambridge, Mass., 1960; H. English,
Danville, Ill., 1960; G. A. Caldwell, New
Orleans, 1961; J. W. Cline, San Francisco,
1961; E. L. Turner, Secretary, Chicago.

Council on Medical Service—R. L. Novy, De-
troit, 1957; R. B. Chrisman Jr., Coral Gables,
Fla., 1958; J. F. Burton, Oklahoma City, 1958;
J. D. McCarthy, Chairman, Omaha, 1959; J.
Lafe Ludwig, Los Angeles, 1959; H. B. Mul-
holland, Charlottesville, Va., 1960; R. M. Mc-
Keown, Coos Bay, Ore., 1960; C. E. Wertz,
Buffalo, 1961; T. J. Danaher, Torrington,
Conn., 1961; Mr. T. A. Hendricks, Secretary,
Chicago.

Council on Constitution and Bylaws—W. W.
Furey, Chicago, 1957; S. H. Osborn, Hart-
ford, Conn., 1958; F. S. Winslow, Rochester,
N. Y., 1959; B. S. Pickett Sr., Chairman, Car-
rizo Springs, Texas, 1960; Walter E. Vest,
Huntington, W. Va., 1961; the President, and
the Speaker and Vice Speaker of the House of
Delegates.

STANDING COMMITTEES OF THE BOARD OF TRUSTEES

Council on Pharmacy and Chemistry—E. M.
K. Geiling, Chicago, 1956; E. M. Nelson,
Washington, D. C., 1956; H. K. Beecher, Bos-
ton, 1956; T. Sollmann, Chairman, Cleveland,
1957; J. P. Leake, Washington, D. C., 1957;
A. C. Curtis, Ann Arbor, Mich., 1957; W. C.
Cutting, San Francisco, 1958; O. O. Meyer,
Madison, Wis., 1958; M. H. Seevers, Ann
Arbor, Mich., 1958; T. M. Brown, Washing-
ton, D. C., 1958; J. Stokes Jr., Philadelphia,
1959; P. H. Long, Brooklyn, 1959; W. G.
Workman, Bethesda, Md., 1959; H. Eagle,
Bethesda, Md., 1959; C. A. Dragstedt, Chi-
cago, 1960; I. Starr, Philadelphia, 1960; J. M.
Hayman, Boston, 1960; H. D. Kautz, Secretary,
Chicago.

Council on Scientific Assembly—M. E. De-
Bakey, Houston, Texas, 1956; S. P. Newman,
Denver, 1957; J. R. McVay, Kansas City, Mo.,
1957; H. R. Viets, Brookline, Mass., 1958; C.
H. Phifer, Chicago, 1958; S. P. Reimann,
Philadelphia, 1959; A. McMahon, Chairman,
St. Louis, 1959; L. W. Larson, Bismarck,
N. D., 1960; C. A. Lincke, Carrollton, Ohio,
1960; T. G. Hull, Secretary, Chicago.

Council on Medical Physics—F. H. Krusen,
Chairman, Rochester, Minn.; H. H. Reese,
Madison, Wis.; G. J. Thomas, Pittsburgh; A.
Blalock, Baltimore; R. H. Chamberlain, Phila-
delphia; G. E. Wakerlin, Chicago; M. R. Mo-
bley, Florence, S. C.; W. B. Allan, Baltimore;
F. C. Bost, San Francisco; S. Warren, Boston;
D. Vail, Chicago; A. C. Cipollaro, New York;
O. Glasser, Cleveland; R. E. DeForest, Secre-
tary, Chicago.

Council on Foods and Nutrition—R. Jackson,
Columbia, Mo., 1956; G. R. Cowgill, Hamden,
Conn, 1956; W. H. Griffith, Los Angeles,
1957; W. J. Darby, Nashville, Tenn., 1958;
C. A. Elvehjem, Madison, Wis., 1958; J. B.
Youmans, Nashville, Tenn., 1958; L. A. May-
nard, Ithaca, N. Y., 1959; C. A. Goldsmith,
New Orleans, 1959; C. S. Davidson, Chairman,
Boston, 1959; C. A. Smith, Boston, 1960; D. B.
Hand, Geneva, N. Y., 1960; P. L. White, Sec-
retary, Chicago.

Council on Industrial Health—W. P. Shep-
ard, Chairman, New York, 1956; M. N. New-
quist, New York, 1956; P. S. Richards, Salt
Lake City, 1957; J. H. Sterner, Rochester,
N. Y., 1957; R. T. Johnstone, Los Angeles,

1958; L. C. McGee, Wilmington, Del., 1958; C. F. Shook, Toledo, Ohio, 1958; J. N. Gallivan, East Hartford, Conn., 1959; V. C. Baird, Houston, Texas, 1959; O. A. Sander, Milwaukee, 1959; R. A. Kehoe, Cincinnati, 1960; E. S. Jones, Hammond, Ind., 1960; B. D. Holland, Secretary, Chicago.

Council on National Defense—S. L. Warren, Los Angeles, 1956; H. B. Wright, Cleveland, 1956, R. A. Benson, Bremerton, Wash., 1957; P. H. Long, Brooklyn, 1957; R. L. Sensenich, South Bend, Ind., 1958; H. C. Lueth, Evanston, Ill., 1958; H. S. Diehl, Chairman, Minneapolis, 1959; R. L. Meiling, Columbus, Ohio, 1959; C. P. Hungate, Kansas City, Mo., 1960, W. B. Martin, Norfolk, Va., 1960; Mr. F. W. Barton, Secretary, Chicago.

Council on Rural Health—A. T. Stewart, Lubbock, Texas, 1956; C. B. Andrews, Sonoma, Calif., 1956; W. J. Weese, Ontario, Ore., 1957; W. A. Wright, Williston, N. D., 1957; F. S. Crockett, Chairman, Lafayette, Ind., 1958; G. F. Bond, Bat Cave, N. C., 1958; C. S. Mundy, Toledo, Ohio, 1959, C. R. Henry, Little Rock, Ark., 1959; F. A. Humphrey, Ft. Collins, Colo., 1960; N. H. Gardner, E. Hampton, Conn., 1960; Mrs. A. Hibbard, Secretary, Chicago.

Council on Mental Health—H. T. Carmichael, Chicago, 1956; M. R. Kaufman, New York, 1957; L. H. Bartemeier, Chairman, Baltimore, 1958; W. H. Baer, Peoria, Ill., 1958; F. J. Gerty, Chicago, 1958, L. H. Smith, Philadelphia, 1959; G. E. Gardner, Boston, 1959; F. M. Forster, Washington, D. C., 1960; R. J. Plunkett, Secretary, Chicago.

Committee on Legislation—J. R. Reuling, Chairman, Windermere, Fla., 1956; M. L. Phelps, Denver, 1956; F. C. Coleman, Des Moines, Iowa, 1957; J. E. McDonald, Tulsa, Okla., 1957; D. G. Smith, Nashua, N. H., 1958; H. English, Danville, Ill., 1958; C. Bailey, Harlan, Ky., 1959; C. L. Palmer, Harrisburg, Pa., 1959; R. B. Chrisman Jr., Coral Gables, Fla., 1960; J. L. Ludwig, Los Angeles, 1960; J. R. McVay, Kansas City, Mo.; Mr. R. G. Van Buskirk, Secretary, Chicago.

The Secretary, Assistant Secretary and Editor are ex officio members of all Standing Committees.

REGISTRATION

The Registration Bureau will be located at the main entrance to the Civic Auditorium on Third Avenue, North, and will be open all day Tuesday, Wednesday, and Thursday, Nov. 27, 28, and 29, and until noon on Friday, Nov. 30.

An information bureau will be operated in connection with the Registration Bureau.

Who May Register

Members—Active, Affiliate, Associate, Service, and Honorary—and invited guests may register for attendance at meetings.

Active members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrollment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations and who have paid their annual American Medical Association membership dues, which this year are $25, to be paid through their constituent medical associations.

Residents, interns, senior medical students, and registered nurses will find special registration cards to fill in on tables near the registration windows. These should be presented, at the window indicated, together with a card or letter signed by the superintendent of the hospital where they are located, or the dean of the medical school they attend.

Register Early

The Registration Bureau will be open at 8:00 a. m., on Tuesday, Nov. 27. Members are urged to take advantage of this early opening.

The names and Seattle addresses of those who register will be included in the *Daily Bulletin*, and this will enable visiting physicians to find friends who have registered.

Suggestions That Will Facilitate Registration

Members who have Advance Registration Cards with pocket cards can be registered with little or no delay. They should fill in the following information on the cards prior to their registration:

Hotel, number of guests, and signature.

Present filled in card with your American Medical Association Membership pocket card at windows marked "Advance Registration." Your pocket card will be returned to you, and you will receive a badge and a copy of the Official Program.

Members without Advance Registration Cards will be given blank cards to fill out, and clerks will be on hand to direct them to the proper windows for registering. They will receive a badge and a copy of the Official Program.

Registration for General Officers and Delegates at the Olympic Hotel

General officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly at the entrance to the Spanish Ballroom at the Olympic Hotel. This arrangement is made for the convenience of members of the House of Delegates, which will convene on Tuesday morning at 10 o'clock in the Spanish Ballroom of the *Olympic Hotel. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Registration* of delegates for the Scientific Assembly will begin at 8 o'clock Tuesday morning, Nov. 27, and delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House.

If any delegate or officer is in Seattle on Sunday or Monday, Nov. 25 or 26, he may register for the Scientific Assembly in the Secretary's Office.

Registration for Lay Executive Secretaries

Lay executive secretaries of component and constituent associations may register any time Sunday or Monday, Nov. 26 or 27, or any time *after 12 noon* Tuesday, Nov. 27, during the week of the session in the Secretary's Office.

TRANSPORTATION

Railroad or Air Travel

It is suggested that those physicians who contemplate traveling to Seattle to attend the Clinical Meeting of the Association secure information concerning railroad and airplane travel directly from their local ticket agents, who are in position to give them information regarding train or plane schedules and fares. Since the meeting is being held close to the Thanksgiving holiday, when travel by all means of transportation will be heavy, reservations should be made promptly.

POST-CONVENTION TOURS

Two post-convention tours to Hawaii are being offered. Complete information concerning these may be obtained from the following persons: Mr. William J. Glennon, Glennon-Kirkland & Associates, 30 North LaSalle, Room 1105, Chicago, Illinois, and Mr. Ralph Neill, Washington State Medical Association, 1309 Seventh Avenue, Suite 201, Seattle 1, Washington.

SEATTLE HOTELS

If hotel reservations have not yet been secured by physicians other than delegates or officers of the Association who expect to attend the Seattle meeting, it is suggested that such physicians fill in and send directly to Chairman, A. M. A. Housing Committee, 40 Seattle Hotel Association, 315 Seneca St., Seattle, Wash., the application form which may be found on advertising page 153 of this issue of The Journal. Please do *not* send applications for hotel reservations to the American Medical Association offices in Chicago. The Seattle Hotel Association is assisting the Housing Committee of the Local Committee on Arrangements.

MEETING PLACES

(See the map of Seattle on advertising page 153 in this issue of The Journal.*)*

General Headquarters, Registration Bureau, Scientific Exhibit, Technical Exhibits, and Information Bureau: Civic Auditorium.

House of Delegates: Spanish Ballroom, Olympic Hotel.
Scientific Meetings: Civic Auditorium.

The Civic Auditorium is located at Third Avenue, North, and Mercer Street.

A. G. Young

Subcommittee on Publicity

Eric R. Sanderson, Chairman

HOUSE OF DELEGATES

The House of Delegates will meet at 10 a. m. Tuesday, Nov. 27, 1956, in the Spanish Ballroom of the Olympic Hotel.

The Reference Committee on Credentials will meet near the entrance to the Spanish Ballroom at 8:30 a. m., Tuesday, Nov. 27, 1956. Credentials should be presented to the Reference Committee on Credentials as early as possible, so that the official roll of the House may be made up and so that the House of Delegates may organize promptly and proceed with its business. The Reference Committee on Credentials will also meet preceding each subsequent meeting of the House of Delegates.

Each delegate should present properly executed credentials signed by the president or secretary of the constituent association or by the chairman or secretary of the section he represents. Alternates presenting credentials should see that the delegates whose places they are to take have signed the alternate authorization.

Each delegate, *before* registering with the Reference Committee on Credentials, should register for the Scientific Assembly at a desk near the entrance to the Spanish Ballroom. Rooms have been provided for the use of committees of the House of Delegates. Reference committees must have their meetings in these rooms and announce the time of their meetings, so that any who are interested in referred matters may be able to appear before the committees.

Typists will be at the service of the members of the House of Delegates for preparing official reports, resolutions, and motions in the Secretary's Office, which will be in Rooms 1 and 2 on the floor below the Spanish Ballroom.

REFERENCE COMMITTEES OF THE HOUSE OF DELEGATES

The Speaker of the House of Delegates, Dr. E. Vincent Askey, California, has appointed delegates to serve on the reference committees of the House at the Seattle meeting as follows.

Amendments to the Constitution and Bylaws

Laurence S. Nelson Sr., *Chairman*, Kansas
Clifford C. Sherburne, Ohio
Leopold H. Fraser, California
Peter M. Murray, New York

Board of Trustees and Secretary, Reports of

John Flack Burton, *Chairman*, Oklahoma
Charles G Hayden, Massachusetts
Wyman D. Barrett, Michigan
R. J. Azzari, New York
Reuben A Benson, Washington

Credentials

R. T. Johnstone, *Chairman*, Section on Preventive Medicine
Arthur A. Lampert, South Dakota
Spencer A. Kirkland, Georgia
Edward B. Tuohy, Section on Anesthesiology

Executive Session

William D. Stovall, *Chairman*, Wisconsin
Milford O. Rouse, Texas
Vincent W. Archer, Virginia
Paul A. Davis, Ohio
Charles L. Shafer, Pennsylvania

Hygiene, Public Health, and Industrial Health

Paul D. Foster, *Chairman*, California
John N. Gallivan, Connecticut
Raymond T. Holden, Washington, D. C.
Edgar V. Allen, Section on Experimental Medicine and Therapeutics
Lall G. Montgomery, Section on Pathology and Physiology

Insurance and Medical Service

George A. Earl, *Chairman*, Minnesota
James P. Hammond, Vermont
J. Mather Pfeiffenberger, Illinois
J. Wallace Hurff, New Jersey
William F. Brennan, Pennsylvania

Medical Education and Hospitals

William A. Hyland, *Chairman*, Michigan
Thomas J. Danaher, Connecticut
James Z. Appel, Pennsylvania
Gerald D. Dorman, New York
Byrl R. Kirklin, Section on Radiology

Medical Military Affairs

Philip S. Foisie, *Chairman*, Massachusetts
Wesley W. Hall, Nevada
Archie O. Pitman, Oregon
H. Relton McCarroll, Section on Orthopedic Surgery
Frank J. Holroyd, West Virginia

Miscellaneous Business

Peter J. DiNatale, *Chairman,* New York
Carll S. Mundy, Ohio
Thomas W. McCreary, Pennsylvania
Robert R. Kierland, Section on Dermatology
Bruce E. Bradley, United States Navy

Reports of Officers

Millard D. Hill, *Chairman,* North Carolina
Robert N. Larimer, Iowa
Durward G. Hall, Missouri
Aldrich C. Crowe, New Jersey
Roy A. Wolford, Veterans Administration

Rules and Order of Business

Orwood J. Campbell, *Chairman,* Minnesota
Walter P. Anderton, New York
George D. Johnson, South Carolina
Charles M. Hamilton, Tennessee
Gordon F. Harkness, Section on Laryngology, Otology, and Rhinology

Sections and Section Work

L. Samuel Sica, *Chairman,* New Jersey
Charles J. Ashworth, Rhode Island
Joseph B. Copeland, Texas
Charles L. Leedham, Section on Military Medicine
R. Stanley Kneeshaw, California

Tellers

John S. DeTar, *Chairman,* Michigan
Edward E. H. Munro, Colorado
Harry L. Arnold Jr., Hawaii
Walter C. Bornemeier, Illinois

Sergeants-at-Arms

H. Thomas McGuire, *Master Sergeant,* Delaware
C. Paul White, Illinois
F. Sanchez-Castano, Puerto Rico

SCIENTIFIC PROGRAM
CIVIC AUDITORIUM

The Council on Scientific Assembly, in presenting the following program of panels, lectures, color television, motion pictures, and scientific exhibits, wishes to extend its appreciation to the local committee on arrangements in Seattle for its contribution of time and energy. The General Chairman, Dr. M. Shelby Jared, together with Dr. Hale Haven and other members of the program committee, spent many months in the preparation of the program.

Room 1 is on the stage on the first floor of the Civic Auditorium, while all other scientific activities are on the lower level. The television program, of which Dr. F. A. Tucker is chairman, originates at Doctors Hospital and is presented with the cooperation of Smith, Kline & French Laboratories, Philadelphia, in Room 2 at the Civic Auditorium. The motion picture program will be conducted each afternoon in Room 4, Civic Auditorium, with a special program on Tuesday evening at the Olympic Hotel. The visiting physician will find a wide range of subjects from which to make his choice, with various features running continuously and simultaneously.

For the sake of convenience in making his selections, the physician will find the printed program grouped by morning and afternoon periods for each day. The program that begins Tuesday morning, Nov. 27, will continue until 12 noon on Friday, Nov. 30.

OPENING GENERAL ASSEMBLY: ROOM 1

Tuesday morning, Nov. 27

Chairman: M. Shelby Jared, Seattle

9:30 Welcome Addresses:
James H. Berge, Seattle, President, Washington State Medical Association.
Arthur B. Langlie, Olympia, Governor, State of Washington.
Gordon A. Clinton, Mayor, City of Seattle.
Dwight H. Murray, Napa, Calif., President, A. M. A.

9:45 The Physicians' Obligation to Society.
Elmer Hess, Erie, Pa., Past-President, A. M. A.

PANELS: ROOM 1

Tuesday morning, Nov. 27

Chairman: Quin B. DeMarsh, Seattle.

10:30 Panel on Hemolytic Anemia.
Robert S. Evans, Seattle, Moderator.
General Subject, Classification.
Dennis M. Donohue, Seattle.
Congenital Hemolytic States.
Arno G. Motulsky, Seattle.
Acquired Hemolytic States.
Eloise R. Giblett, Seattle.
Practical Approach to Diagnosis.
Alexander R. Stevens, Seattle.

ROOM 4

Tuesday morning, Nov. 27

Chairman: Robert H. Stewart, Seattle.

10:30 Panel on Management of Postpartum Problems.
Francis L. McPhail, Great Falls, Mont., Moderator.
Lactation.
Harry A. Kettering, Seattle.
Postpartum Bleeding.
Albert F. Lee, Seattle.
Infections.
Gerhard Ahnquist, Seattle.
Office Postpartum Problems.
Donald J. Thorp, Seattle.

LECTURES: ROOM 3

Tuesday morning, Nov. 27

Chairman: Siegfried F. Herrmann, Tacoma, Wash.

10:30 Treatment of Undescended Testis and Its Complications.
John R. Hand, Portland, Ore.

11:00 Early Prostatic Carcinoma: Responsibility of the General Practitioner.
Clarence V. Hodges, Theodore H. Lehman, and Curtiss A. Macfarlane, Portland, Ore.

11:30 Some Principles in the Care of Urinary Tract Injuries.
J. L. McCormack and A. W. Kretz, Seattle.

COLOR TELEVISION: ROOM 2

Tuesday morning, Nov. 27

Chairman: Paul R. Rollins, University of Washington School of Medicine, Seattle.

10:30-11:30 Wet Clinic on Cesarean Section.
Russell R. de Alvarez, University of Washing School of Medicine, Seattle, Moderator.
Participants: Paul G. Peterson, L. Bruce Donaldson, Robert M. Campbell, and R. Philip Smith, University of Washington School of Medicine, Seattle.

PANELS: ROOM 1

Tuesday afternoon, Nov. 27

Chairman: Charles S. Fine, Seattle.

1:30 Panel on Hypertension: Current Concepts of Management.
Robert L. King, Seattle, Moderator.
Participants: Edgar V. Allen, Rochester, Minn., George F. Strong, Vancouver, B. C., Edward D. Freis, Washington, D. C., and Henry B. Garrigues, Seattle.

3:00 Panel on Problems of Prenatal Care.
Alec M. Agnew, Vancouver, B. C., Moderator.

Over-Term Pregnancy as an Antenatal Problem.
John J. Young and Eugene Bradley, Fort Lewis, Wash.

RH Factor. Eloise R. Giblett, Seattle.

Early Recognition and Treatment of Preeclampsia.
Donald McIntyre, Seattle.

Evaluation of the Bony Pelvis. Glen G. Rice, Seattle.

Psychological Problems of Pregnancy.
Thomas H. Holmes, Seattle.

Nutritional Deficiencies and Anemia.
Walter S. Keifer Jr., Seattle.

LECTURES: ROOM 3

Tuesday afternoon, Nov. 27

Chairman: Alexander Barclay Jr., Coeur d'Alene, Idaho.

1:00 The Influence of a High Fluid Intake in Correcting Previously Resistant Congestive Heart Failure.
John A. Layne, Great Falls, Mont.

1:30 Normal Hemoglobin and Red Blood Count Findings in Women.
Harriet Emigh Judy and Norene Brandt Price, Spokane, Wash.

2:00 Treatment of Mild Depressions in General Office Practice. Frederick Lemere, Seattle.

2:30 Inherent Dangers in the Use of Tranquilizing Drugs in Anxiety States.
Herman A. Dickel and Henry H. Dixon, Portland, Ore.

3:00 Miltown (Meprobamate) in Premenstrual Tension.
Veronica M. Pennington, Whitfield, Miss.

3:30 Emotional Reactions to Surgical Procedures.
Norman C. Chivers, Seattle.

4:00 The Physiological Treatment of Barbiturate Poisoning.
Fred Plum and August G. Swanson, Seattle.

4:30 Newer Concepts of Management of Ulcerative Colitis.
Lucius D. Hill, Caleb S. Stone, and Clarence C. Pearson, Seattle.

COLOR TELEVISION: ROOM 2

Tuesday afternoon, Nov. 27

DRY CLINICS

2:00 Spinal Anesthesia—1956.
Participants: John J. Owen, John M. MacKinnon, Kenneth F. Eather, and George E. Wright, Seattle.

2:30 Treatment of Burns.
Participants: Donald T. Hall, Children's Orthopedic Hospital, Seattle, Henry N. Harkins, University of Washington School of Medicine, Seattle, and J. Thomas Payne, Veterans Administration Hospital, Seattle.

3:00 Amputations and Prosthetics.
Participants: Ernest M. Burgess, Veterans Administration, Children's Orthopedic and Doctors Hospitals, Seattle, R. L. Romano, King County Hospital, Seattle, and B. E. McConville, Washington Rehabilitation Center, Seattle.

3:30 Skin Clinic.
Participants: Robert A. Pommerening, Alex D. Campbell, and Robert T. Potter, University of Washington School of Medicine, Seattle.

MOTION PICTURES: ROOM 4

Tuesday afternoon, Nov. 27

1:00 Fractures of the Leg and Ankle.
William Larmon, Chicago.

1:30 Technique of Shoulder Girdle Amputation.
Robert S. Smith, Boise, Idaho.

1:40 Routine Anorectal and Sigmoidoscopic Examination with Differential Diagnosis.
Malcolm R. Hill, Los Angeles.

2:09 Technique of Proctoscopy.
Raymond J. Jackman and Edward R. Morgan, Rochester, Minn.

2:26 Carcinoma of the Stomach.
Alton Ochsner, New Orleans.

2:58 Appendectomy. Philip Thorek, Chicago.

3:21 Resuscitation for Cardiac Arrest.
Claude S. Beck, Cleveland.

3:39 Block Dissection and Pneumonectomy for Bronchogenic Carcinoma. John F. Higginson, Portland, Ore.

4:08 Grand Rounds: Diagnosis and Management of Acute Abdominal Problems.
Charles G. Child, III, Orvar Swenson, Harold F. Rheinlander, Boston, Leo G. Rigler, Owen H. Wangensteen, Minneapolis, Michael J. Lepore, New York, and Walter L. Palmer, *Chicago.*

MOTION PICTURES: OLYMPIC BOWL, OLYMPIC HOTEL

Tuesday evening Nov. 27

8:00 The Doctor as an Expert Witness.
Premiere showing of a film produced by the A. M. A. in cooperation with the William S. Merrell Company, Cincinnati.

MOTION PICTURES: SPANISH BALLROOM, OLYMPIC HOTEL

9:30 Monganga.
A special film report in color on missionary medicine in the Belgian Congo—the latest program in the March of Medicine series. Presented by Smith, Kline & French Laboratories, Philadelphia, in cooperation with the A. M. A.

PANELS: ROOM 1

Wednesday morning, Nov. 28

Chairman: Gayton S. Bailey, Seattle

9:00 Panel on Problems of Aging.
Henry B. Mulholland, Charlottesville, Va., Chairman, Committee on Aging, Council on Medical Service, A. M. A., Moderator.

Health Maintenance.
J. D. McCarthy, Omaha, Chairman, Council on Medical Service, A. M. A.

Nutrition.
Frederick C. Swartz, member, Committee on Aging, Council on Medical Service, A. M. A., Lansing, Mich.

Control of Fatigue.
Theodore G. Klumpp, member, Committee on Aging, Council on Medical Service, A. M. A., New York.

Rehabilitation and Restorative Services.
Albert L. Cooper, Seattle.

Motivation for Living.
Cecil Wittson, member, Committee on Aging, Council on Medical Service, A. M. A., Omaha.

The Oldster and His Doctor.
Wingate M. Johnson, member, Committee on Aging, Council on Medical Service, A. M. A., Winston-Salem, N. C.

Modern Attitudes on Aging.
Edward L. Bortz, member, Committee on Aging, Council on Medical Service, A. M. A., Philadelphia.

4:00 Diabetes and Pregnancy.
John W. Stephens, Portland, Ore.

4:30 Surgical Management of the Severely Burned Child.
Robert S. Smith, Boise, Idaho.

COLOR TELEVISION: ROOM 2

Thursday afternoon, Nov. 29

DRY CLINICS

2:00 Office Diagnosis of Operable Heart Disease.
Robert A. Tidwell, Children's Orthopedic Hospital and University of Washington School of Medicine, Seattle, J. C. Michel, University of Washington School of Medicine, Seattle, James L. Tucker, Children's Orthopedic Hospital, Seattle, and Robert M. Levenson, University of Washington School of Medicine, Seattle.

2:30 Erythroblastosis.
William J. Warmington, Seattle, Edwin T. MacCamy and Clement A. Finch, University of Washington School of Medicine, Seattle, and Eloise R. Giblett, King County Central Blood Bank, Seattle.

3:00 Arthritis Clinic.
Edward E. Rosenbaum and Arthur C. Jones, University of Oregon Medical School, Portland, Ore., James W. Brooke, Eugene Clinic, Eugene, Ore., and Robert E. Rinehart, Rinehart Clinic, Wheeler, Ore.

3:30 Chest Emergencies.
Fred J. Jarvis, University of Washington School of Medicine, Seattle, Robert C. Coe, Seattle, Norman Arcese, Laurel Beach Sanitarium and University of Washington School of Medicine, Seattle, and James F. Nelson, U. S. Public Health Service Hospital and University of Washington School of Medicine, Seattle.

MOTION PICTURES: ROOM 4

Thursday afternoon, Nov. 29

1:00 The Patient Is a Person.
Samuel J. Fogelson, Chicago.

1:20 Diagnosis and Office Management of the Arthritides.
William B. Rawls, New York.

1:49 Myomectomy and Myometrial Reconstruction.
A. R. Abarbanel, Los Angeles.

2:15 A Place to Live. (Problems of the Aged).
National Social Welfare Assembly, New York.

2:39 Teaching Speech After Laryngectomy.
National Cancer Institute, Washington, D. C.

3:23 Modern Concepts of Epilepsy.
Francis M. Forster and Bushnell Smith, Washington, D. C.

PANELS: ROOM 1

Friday morning, Nov. 30

Chairman: J. Lester Henderson, Seattle.

9:00 Panel on Diabetes.

The Mode of Action of Insulin.

The Present Status of Available Insulins.

Present Evaluation of the Clinical Application of the Solfonureas.

Proper Handling of Hypothetical Patients:

Beginning Treatment.

Neuropathy.

Early Nephropathy and Retinopathy.

Influences of Various Hormones Upon the Diabetic.

Lester J. Palmer, Seattle, Moderator.

Participants: Joseph H. Crampton, Seattle, Blair Holcomb, Portland, Ore., Henry Mulholland, Charlottesville, Va., Robert H. Williams, Seattle, and Edward H. Rynearson, Rochester, Minn.

10:30 Panel on Tranquilizing Drugs—Past, Present, and Future.
L. E. Hollister, Palo Alto, Calif., Moderator.

Participants: Lester H. Margolis, San Francisco, James M. Dille, Seattle, Else B. Kris, New York, and Frederick Lemere, Seattle.

PANELS: ROOM 4

Friday morning, Nov. 30

Chairman: Byron F. Francis, Seattle.

9:00 Panel on Coronary Heart Disease.
Louis E. Martin, Los Angeles, Moderator.

Herbert E. Griswold Jr. and Franklin J. Underwood, Portland, Ore., and Robert A. Bruce, Seattle.

10:30 Panel on Surgical Treatment of Pelvic Malignancies.
Russell R. de Alvarez, Seattle, Moderator.

Vulva.	Edwin T. MacCamy, Seattle.
Cervix.	R. Philip Smith, Seattle.
Uterus.	Reuben E. Nelson, Seattle.
Ovaries.	H. J. Schroeder, Seattle.

LECTURES: ROOM 3

Friday morning, Nov. 30

Chairman: Wallace W. Lindahl, Seattle.

9:00 Prevention of Blindness and the General Practitioner.
Andrew F. M. De Roetth, Spokane, Wash.

9:30 Treatment of Iron Deficiency in Childhood with Intramuscular Iron-Dextran.
Ralph O. Wallerstein and M. Silvija Hoag, San Francisco.

10:00 Hyaline Membrane Disease—Clinical and X-Ray Diagnosis for Purposes of Prognosis.
Eugene J. P. Drouillard, Kenneth J. Lampert and George H. Barmeyer Jr., Missoula, Mont.

10:30 Gastric Ulcer: A Review of a Series of Patients Followed from Two to Five Years.
Clarence C. Pearson, Richard F. Jones, and Randolph Clements, Seattle.

11:00 Clinical Approach to Steatorrhea.
Howard M. Spiro, New Haven, Conn.

11:30 Hypogammaglobulinemia and Agammaglobulinemia.
Beach Barrett and Wade Volwiler, Seattle.

COLOR TELEVISION: ROOM 2

Friday morning, Nov. 30

WET CLINICS

9:00 Vein Stripping.
Participants: Dean K. Crystal, Clyde L. Wagner, Matthew H. Evoy and Van K. Hillman, University of Washington School of Medicine, Seattle, and James L. Vadheim, Tacoma, Wash.

10:00 Inguinal Hernia.
Joel W. Baker, Mason Clinic and University of Washington School of Medicine, Seattle, Operating Surgeon.

Henry N. Harkins, Madigan General Hospital, Fort Lewis, Wash., Veterans Administration Hospital and University of Washington School of Medicine, Seattle, Moderator.

Lucius D. Hill, Mason Clinic, Seattle, Collaborator.

Participants: Frank Henry, University of Washington School of Medicine, Seattle, and Donald T. Hall, Children's Orthopedic Hospital, and University of Washington School of Medicine, Seattle.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will be located on the lower level of Civic Auditorium and will be reached by entrances from the Technical Exposition.

The Council on Scientific Assembly has arranged several features, including a group of exhibits on the history of medicine in the Northwest, the Special Exhibit on Fractures, and Manikin Demonstrations on Problems of Delivery.

The Scientific Exhibit will open Tuesday morning, Nov. 27, at 9 a.m. and will close Friday, Dec. 2, at 12 noon. On the intervening days, it will be open from 8:30 a. m. to 5:30 p. m. The office of the Council on Scientific Assembly will be located in Space 109 in the Scientific Exhibit.

MEDICINE IN THE PACIFIC NORTHWEST

A group of exhibits on the history of medicine in the Pacific Northwest will be presented, showing the contributions which physicians have made to the development of this area. Material will be shown from Oregon; British Columbia, Canada; and Washington.

William F. Goff, *Seattle*, is the chairman of these exhibits.

SPECIAL EXHIBIT ON FRACTURES

The Special Exhibit on Fractures is presented under the auspices of the following committee:

Ralph G. Carothers, Cincinnati, chairman.
Harry B. Hall, Minneapolis.
Charles V. Heck, Chicago.

Continuous demonstrations will be conducted daily from 10 a. m. to 12 noon and from 2 to 4 p. m. from Tuesday morning to Friday noon on the following subjects:

Fractures Resulting from a Fall on the Outstretched Hand.

Fractures About the Elbow.

Fracture of the Lower End of the Radius.

Basic principles will be stressed, with particular emphasis on the interest of the physician in general practice. Ample opportunity will be allowed for questions, and members of the committee will be present to discuss individual problems with visiting physicians.

A pamphlet giving the essential features of the exhibit has been prepared for distribution.

The following surgeons will assist the committee in the presentation of the exhibit:

Thomas A. Angland, Yakima, Wash.
Richard F. Berg, Portland, Ore.
Roy E. Brackin, Winnetka, Ill.
James R. Degge, Eugene, Ore.
Forrest L. Flashman, Seattle.
Robert W. Florence, Tacoma, Wash.
Paul Goetowski, Lincoln, Neb.
Kenneth T. Hubbard, Maywood, Ill.
Richard H. Jones, Minneapolis.
Edward H. Juers, Red Wing, Minn.
William J. Kisiel, Springfield, Mass.
Sydney N. Lyttle, Flint, Mich.
Andrew R. Mailer, Madison, Wis.
Roland F. Neumann Jr., St. Louis.
Theodore Norley, Columbia, S. C.
Frederick G. Rosendahl, Minneapolis.
Edmund T. Rumble Jr., Callicoon, N. Y.
S. Ralph Terhune, Birmingham, Ala.
Franklin V. Wade, Flint, Mich.

PROBLEMS OF DELIVERY—MANIKIN DEMONSTRATIONS

Manikin demonstrations on problems of delivery will be conducted at stated intervals throughout the week by outstanding obstetricians. An opportunity for questions and answers will be given after each demonstration.

H. Charles Franklin, Seattle, chairman, is in charge of the demonstrations. The following schedule will be presented:

Tuesday, Nov. 27

10:00 a.m. Persistent Occiput Posterior.
Samuel H. Davidson, Seattle.

1:00 p.m. Persistent Occiput Posterior.
Jerome F. Smersh Jr., Seattle.

4:30 p.m. Breech Delivery.
Lawrence H. Tarte, Seattle.

Wednesday, Nov. 28

10:00 a.m. Persistent Occiput Transverse.
Robert J. Lowden, Seattle.

1:00 p.m. Internal and External Podatic Version.
Karl H. Klopfenstein, Seattle.

4:30 p.m. Outlet Forceps.
David C. Figge, Seattle.

Thursday, Nov. 29

4:30 p.m. Breech Delivery.
A. Lawrence Banks, Seattle.

Friday, Nov. 30

9:30 a.m. Deep Transverse Arrest.
Joseph G. Sebren, Seattle.

The Body Fluids: Foundation Facts, Clinical Diagnosis, Therapy.
W. D. Snively Jr., M. J. Sweeney, and Martha L. Wessner, St. Mary's Hospital, Evansville, Ind.

Bedside Methods for Electrolyte Determinations.
Belding H. Scribner, J. Burnell, B. Uyeno, and A. Skinner, University of Washington School of Medicine and Veterans Administration Hospital, Seattle.

The Factors Influencing the Coronary Circulation.
Eliot Corday, Herbert Gold, and Lauro B. De Vera, Cedars of Lebanon Hospital and University of California at Los Angeles School of Medicine, Los Angeles.

Esophageal Motility: Dynamics of Deglution in Health and Disease.
C. F. Code, A. M. Olsen, F. E. Donoghue, H. A. Andersen, B. Creamer, F. E. Fyke Jr., and A. H. Bulbulian, Mayo Clinic and Mayo Foundation, Rochester, Minn.

Lymph Node Imprints.
Edwin E. Osgood, Nelson Niles, Robert D. Koler and A. J. Seaman, University of Oregon Medical School, Portland, Ore.

Hypogammaglobulinemia and Agammaglobulinemia.
Beach Barrett and Wade Volwiler, University of Washington School of Medicine, Seattle.

A Clinical Appraisal of Antiemetic Agents.
Paul K. Conner, John H. Moyer, Sam A. Kinard, and Charles Heider, Baylor University College of Medicine, Houston, Texas.

Prednisone and Prednisolone in Experimental Bacterial Infection and Toxemia.
Harry Seneca, Olga Kupyn and A. Kozar, Columbia University College of Physicians and Surgeons, New York.

Prednisolone Tertiary Butylacetate and Hexylcaine in Soft Tissues—Non-articular Injection Techniques.
Eugene G. Lipow, George Washington University School of Medicine, Washington, D.C., and Richard T. Smith, Benjamin Franklin Clinic, Philadelphia.

Evaluation of Sulfaethylthiadiazole in Pediatric Practice.
John D. Farquhar, Lankenau Hospital, Philadelphia.

Rehabilitation of the Asthmatic Child.
W. B. Steen and C. P. Neumann, The Sahuaro School, Tucson, Ariz.

Malignant Carcinoid, a New Metabolic Disorder.
Albert Sjoerdsma, Luther L. Terry, and Sidney Udenfriend, National Heart Institute, Bethesda, Md.

Lysine Needs in Nutritional Stress of the Aged.
Anthony A. Albanese, Reginald A. Higgons, and Louise A. Orto, St. Luke's Convalescent Hospital, Greenwich, Conn.

Stimulation of Appetite and Weight Gain in the Underweight Child.
Emanuel Dubow, Beekman Downtown Hospital, New York.

Weight Control.
Robert H. Barnes, University of Washington School of Medicine, Seattle.

Dyclonine: A Topical Anesthetic with Antimicrobial Properties.

P. A. Boyer Jr., H. J. Florestano, and B. E. Abreu, Pitman-Moore Company, Indianapolis.

Multiple Myeloma.

Maurice Hardgrove and Dann B. Claudon, Columbia Hospital, Milwaukee, Wis.

Cystic Fibrosis of the Pancreas, Lungs, etc.—Diagnosis and Treatment.

Gordon E. Gibbs, University of Nebraska College of Medicine, Omaha.

Rehabilitation of Poliomyelitis Patients with Respiratory Involvement.

Hart E. Van Riper, National Foundation for Infantile Paralysis, New York.

Chronic Headache—an Analysis of 1254 Cases.

Lester S. Blumenthal and Marvin Fuchs, George Washington University Hospital, Washington, D. C.

Oral Phenoxymethyl Penicillin in the Treatment of Bacterial Endocarditis.

E. L. Quinn, J. M. Colville, Frank Cox Jr., and Joseph Truant, Henry Ford Hospital, Detroit.

Diagnosis and Management of Patients with Arterial Hypertension: Evaluation of Five Year Experience with Depressor Drugs.

Joseph H. Hafkenschiel Jr., Philadelphia.

Use of Ganglionic Blocking Agents in Hypertension.

John H. Moyer, Ralph Ford, Robert McConn, Coleman Caplovitz, and Edward Dennis, Baylor University College of Medicine, Jefferson, Hermann, and Veterans Administration Hospitals, Houston, Texas.

Drug Therapy of Hypertension.

Marvin Moser, Roderick Granzen and Alice Macaulay, Grasslands Hospital, Valhalla, N. Y.

The Treatment of Ambulatory Hypertensive Patients with Chlorisondamine.

Richard A. Dunsmore, A. F. Bickford, and L. D. Dunsmore, Philadelphia General Hospital, Philadelphia.

Progress in the Treatment of Hypertension.

Garfield G. Duncan, Jerome Waldron, Robert J. Gill, and William K. Jensen, Pennsylvania Hospital, Philadelphia.

Foreign Bodies in the Eye.

Everet H. Wood, Jackson Clinic and University of Wisconsin Medical School, Madison, Wis.

Conservation of Hearing Program.

John F. Tolan, Heston L. Wilson, Jack Artz, and Warren R. Dawson, Seattle Hearing and Speech Center, Mason Clinic, Seattle.

Modern Therapy of Uveitis.

Dan M. Gordon, New York Hospital-Cornell Medical Center, New York.

Advancement in Diagnosis and Treatment of Non-Otosclerotic Middle Ear Deafness.

H. G. Kobrak, Geraldine Purcell, and Eduard Domeier, Wayne University College of Medicine, Detroit.

Glaucoma: Detection as a Prevention of Blindness.

Louis N. Hungerford Jr., Mason Clinic, and Wood Lyda, Seattle.

The Ventilatory Factor in the Symptomatology of Cardiorespiratory Conditions.

Edward Matzger, San Francisco.

Laboratory Techniques in the Diagnosis of Communicable Diseases.

R. B. Hogan, M. M. Brooke, G. R. Cooper, D. S. Martin, and M. Schaeffer, Communicable Disease Center, Public Health Service, Department of Health, Education and Welfare, Atlanta, Ga.

Treponema Pallidum Complement Fixation Test.

Harold J. Magnuson and Joseph Portnoy, Public Health Service's Venereal Disease Program, Department of Health, Education, and Welfare, Washington, D. C.

Effects of Smoking on the Bronchia Mucosa.

Kenneth P. Knudtson, Veterans Administration Hospital, and University of Washington School of Medicine, Seattle.

Cancer in the Lung and Cuban Tobacco—Experimental Works in Animals and Human Beings.

José Azel, Om Laboratory, Linner Laboratory, Finlay Institute, Havana, Cuba.

The Profession of Medical Technology.

Raymond F. Hain and Lester D. Ellerbrook, University of Washington School of Medicine, Seattle.

Useful Cytological Collection Methods for the Medical Practitioner.

H. L. Richardson and John B. Thiersch, Seattle.

Rheumatoid Arthritis: Diagnosis and Treatment.

Dwight C. Ensign and John W. Sigler, Henry Ford Hospital, Detroit, Donald F. Hill and W. Paul Holbrook, Tucson, Ariz.

Osteoarthritis.

Bernard M. Norcross and Salvatore R. LaTona, University of Buffalo School of Medicine and Buffalo General Hospital, Buffalo, N. Y.

Self-Help Devices for Arthritic Patients.

Edward W. Lowman, Institute of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center, New York.

Rheumatoid Spondylitis.

Theodore A. Potter, Robert B. Brigham Hospital, Boston.

The Painful Shoulder.

Otto Steinbrocker, Sidney Berkowitz, Mortimer Ehrlich, and Marvin Chirls, Hospital for Joint Diseases and Lenox Hill Hospital, New York.

Information about Arthritis and Rheumatism.

Russell L. Cecil and R. W. Lamont-Havers, The Arthritis and Rheumatism Foundation, New York.

REPORTS OF OFFICERS

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The following annual report of the Secretary is respectfully submitted:

Membership

The number of physicians holding membership in the American Medical Association increased by 4,509 during the fiscal year ending June 30, 1956, as compared with the same period ending June 30, 1955. A breakdown of the membership records as of June 30 indicates the following:

	1956	1955
Active Paid Members	130,606	123,462
Active Members (Dues unpaid by June 30)	3,479	7,649
Active Members exempt from dues	11,082	11,167
Associate Members	6,313	4,821
Service Members	8,544	8,402
Affiliate Members	269	282
Honorary Members	94	95
Total Membership on June 30	160,387	155,878

The income from membership dues for the first six months of 1956 was $3,217,195, which was an increase of $202,940 over the same period for 1955.

The accompanying table shows the number of physician members of state and territorial medical associations who also hold membership in the American Medical Association. Comparative figures are given as of June 30, for both 1955 and 1956.

Number of Physicians in United States and Territories and Number of Members of American Medical Association

State	No. of Physicians	Active Members		Associate Members	Total 1956	Total 1955
		Dues Paying	Dues Exempt			
Alabama	2,321	1,459	264	5	1,728	1,626
Alaska	102	79	11	42	132	67
Arizona	1,018	739	32		771	797

As of June 30, there were only 3,479 physicians whose American Medical Association membership status for the year 1956 had not been established through their constituent medical associations. The dues-delinquent physicians were asked to contact the secretaries of their respective societies in May. If the physician's eligibility for continued membership in the Association was not established by July 1, 1956, the physician was notified that he was being dropped from membership in the American Medical Association under the provisions of Chapter III, Section 5 of the Constitution and Bylaws. A copy of the suspension notice was sent to the secretary of the respective constituent association. This delinquency date for suspension of of membership will be *advanced to June 1 in 1957.* A physician cannot be reinstated for membership in the American Medical Association until his dues delinquency for the year in which he was dropped from membership is cleared through his constituent medical association.

The increased efficiency and flexibility of the IBM record system has made it possible to mail the current Membership Pocket Card to the physician within 48 hours after the membership classification status has been properly reported by the constituent association. Also, new members of the Association now receive their first copy, as well as back issues, of the publication they have chosen as a benefit of paid membership within a few days after the dues payment reaches the Membership Department.

The secretaries of constituent and component medical societies have cooperated whole-heartedly with the Membership Department, and many of them have revised their local membership regulations to conform with the standard pattern of membership classifications set by the American Medical Association Constitution and Bylaws.

Registration at Annual and Clinical Meetings

The Secretary, under the provisions of the Bylaws, is responsible for the "arrangements for annual, interim, or special sessions of the . . . Scientific Assembly", which includes the registration of general attendance at the annual and clinical meetings. The following is a tabulation of the registered attendance at the Boston Clinical Meeting and the Chicago Annual Meeting in December, 1955, and June, 1956, respectively.

The registration at the Boston Clinical Meeting and the Chicago Annual Meeting is shown in detail. The total cost of operating the Registration Bureau at the Boston meeting was $4,210. The cost of operating the Registration Bureau at the Chicago Meeting was $5,819.

REGISTRATION, BOSTON, NOV. 29-DEC. 2, 1955

Physicians	3,779
Residents	642
Interns	146
Students	780
Nurses	210
Technicians	176
Physicians' Guests	1,982
Total	7,715
Technical Exhibitors	720
Technical Exhibitors' Guests	192
Grand Total	8,637

REGISTRATION, CHICAGO, JUNE 11-15, 1956

Physicians	9,969
Residents	785
Interns	315
Students	680
Nurses	374
Technicians	357
Physicians' Guests	10,705
Total	23,185
Technical Exhibitors	3,246
Technical Exhibitors' Guests	684
Grand Total	27,115

During one morning of the Atlantic City Annual Meeting in June, 1955, admittance to the Technical and Scientific Exhibits was limited to physician members of the Association. Based on the favorable reception of this test, it was repeated for two half days at the Chicago Annual Meeting on Wednesday and Thursday mornings. Upon the recommendation of the Board of Trustees, this restricted attendance will be expanded to three half days—the mornings of Tuesday, Wednesday, and Thursday—at the New York Annual Meeting in June, 1957. This opportunity for the member-physician to view the exhibits and visit the lectures strictly with his own fellow members has met with the approval of both the majority of the Association's membership and the scientific and technical exhibitors.

Activity in the Field

The number of medical meetings which the Secretary and Assistant Secretary have attended and have participated in during the past year has been greater than in any previous year. The Secretary has responded, whenever possible, to every request for his personal appearance at their meetings from constituent and component medical societies, and on many occasions when other commitments have interfered the Assistant Secretary has substituted for him. Both have traveled many thousands of miles on the business of the Association.

Appreciation

The Secretary offers an expression of sincere appreciation for the assistance and many courtesies he has received from the officers and members of official bodies of the Association, as well as from many officers and members of constituent and component medical societies, not to mention innumerable individual members of the Association's rank and file. The personnel at the headquarters office are deserving of praise for loyal and efficient contribution to the successful administration of the Association's affairs.

Respectfully submitted,

George F. Lull, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the Members of the House of Delegates of the American Medical Association:

The following annual report of the Board of Trustees is respectfully submitted.

Report on Matters Referred by House of Delegates

American Medical Association Dues Collection.—In response to the intent of Resolution No. 13 and the recommendation of the House of Delegates, the Board of Trustees has authorized a letter to be sent to the secretaries of constituent state and territorial medical associations for the purpose of ascertaining their costs in collecting American Medical Association membership dues. The letter requests a complete breakdown of collection expenses for 1956, including salaries of clerical workers (with prorating of time devoted to American Medical Association dues collection), stationery, postage, etc. As soon as this study is complete, a final report will be made to the House.

Membership.—The Board of Trustees considered Resolution No. 42, directing that the Association augment its efforts to stimulate new memberships by an increased cooperative effort with state and county medical associations. The Board authorized the Secretary and General Manager to communicate with those states where American Medical Association membership is low in an effort to stimulate further activities on the part of local societies. The Subscription and the Public Relations Department are also increasing their promotional efforts in this regard.

Cancer Commissions.—Following the Boston, 1955 meeting, the Board of Trustees voted that Resolution No. 15, recommending the establishment of cancer commissions by state medical societies, which was approved by the House, be sent to all constituent associations. A letter transmitting the action of the House was sent on March 12, 1956.

Rehabilitation.—In December, 1955, the House of Delegates approved in principle Resolution No. 27 urging the establishment of an integrated consultation service to state societies and outlining a policy of procedure for the guidance of local professional groups in dealing with the total program of rehabilitation. Inasmuch as the Committee on Rehabilitation, previously authorized by the House of Delegates and the Board of Trustees, is now an established group within the Association, the Board referred this resolution to that Committee for study and recommendation.

Traffic Safety.—Resolutions on this subject were introduced in the House of Delegates at its December, 1955, and June, 1956, meetings. Resolutions No. 18 and 19 (Boston, 1955), recommending (1) a study of prevention of highway accidents, and (2) national regulation of automobile safety standards, have been referred to the Association's Committee on Medical Aspects of Automobile Injuries and Deaths.

Resolution No. 19 from the June, 1956, meeting suggested (a) the establishment of traffic safety committees on a state and local level, (b) that cooperative effort be established between the American Medical Association committee and the various local committees of the White House Conference on Safety, and (c) that a national meeting of the Association's committee be held to implement the responsibilities of the medical profession in automobile safety. The Board referred Resolution No. 19 to the Committee on Medical Aspects of Automobile Injuries and Deaths with the recommendation that (a) and (b) be implemented. It recommended, however, that action be not taken at this time on a national meeting.

Medical Hall of Fame.—Further consideration has been given to the recommendation for the establishment of a United States Medical Hall of Fame (December, 1955). Because of limitations of space, the expense involved, and the fact that one national medical organization is at the present time completing its Hall of Fame, the Board recommends to the House that the American Medical Association do not establish a Hall of Fame at this time.

Continuing Commission on Economic Policy.—The Board of Trustees has very carefully considered Resolution No. 54 on Continuing Commission on Economic Policy, introduced by the California delegation at the Atlantic City meeting of the House in June, 1955, and the supplementary report of the Council on Medical Service in this regard, adopted by the House in December, 1955. In addition, the Board has reviewed the article entitled "A Constructive Economic Platform for the American Medical Association," by Dr. Lewis A. Alesen, a member of the House, which appeared in the November, 1954, issue of *Northwest Medicine.*

There are many matters to be taken into consideration in extending the activities of the American Medical Association to areas not hitherto considered an appropriate function of our Association.

The Board of Trustees has, therefore, referred this resolution to its Task Force on Socio-Economic Policy, composed of Drs. Leonard W. Larson, F. J. L. Blasingame, James R. McVay, John F. Lucas, Joseph F. Griffith, James Z. Appel, Paul C. Foster, and James R. Reuling, which has under consideration some of the problems mentioned in the resolution. The Task Force hopes to report to the Board at a special meeting to be held in the near future. Any recommendations of the Task Force after presentation to and approval by the Board will be transmitted to the House of Delegates.

Liaison with Pharmaceutical Manufacturers.—In conformity with the directive of the House of Delegates that liaison be established with pharmaceutical manufacturers (June, 1956), the Board of Trustees appointed a committee which met with representatives of the pharmaceutical industry on Sept. 13 for a discussion of problems of mutual interest. Since the primary objective of both medicine and industry is to provide medical help for the sick, it was agreed that much good could stem from such discussion.

A number of basic problems was discussed and several questions were raised, namely: (1) How can the drug industry reach the doctors with their messages with a minimum of cost and with a minimum of risk of offense? (2) What does the physician want from the drug industry or its representatives? (3) Would the American Medical Association undertake a survey of physicians to determine how the industry can better serve the profession, with emphasis on the methods of communication now employed by the industry to reach the doctors of this country? Many problems, such as free distribution of drugs, expenditures in broader fields of advertising and in support of research, and educational articles were discussed. It was decided, however, that decisions for action could not be made until the attitude of the profession toward some of these practices could be determined by an impartial body. If such facts could be ascertained, the industry in general would no doubt be pleased to receive them.

It was agreed that future meetings would be held, and the Board of Trustees was requested to consider a survey. The Board has referred the matter of a survey to a special committee for consideration and recommendation.

All other resolutions referred to the Board of Trustees have been forwarded to the several councils or committees concerned. As soon as reports are available, they will be transmitted to the House of Delegates for action.

Hospitalization of Patients with Alcoholism

The problem of the hospitalization of patients with the diagnosis of alcoholism has been considered carefully by the Council on Mental Health and its Committee on Alcoholism. A report and resolution on this subject was submitted to the Board and approved for presentation to the House of Delegates for its action. The statement follows:

Among the numerous personality disorders encountered in the general population, it has long been recognized that a vast number of such disorders are characterized by the outstanding sign of excessive use of alcohol. All excessive users of alcohol are not diagnosed as alcoholics, but all alcoholics are excessive users. When, in addition to this excessive use, there are certain signs and symptoms of behavioral, personality and physical disorder or of their development, the syndrome of alcoholism is achieved. The intoxication and some of the other possible complications manifested in this syndrome often make treatment difficult. However, alcoholism must be regarded as within the purview of medical practice. The Council on Mental Health, its Committee on Alcoholism, and the profession in general recognizes this syndrome of alcoholism as illness which justifiably should have the attention of physicians.

One of the most consistent complaints of physicians who wish to care for these patients is that many hospitals will not admit such patients with a diagnosis of alcoholism. Many feel that these people are intractable, uncooperative, and difficult to handle. Because of their untoward behavior, hospital authorities feel that they are not equipped to take care of the medical treatment of such overactive patients. Where such patients are unruly and uncooperative, this attitude is understandable. However, for many of these sick people who express a wish to be treated in a general hospital, it has been generally found that cooperation is forthcoming and that no special attention or equipment is necessary for treating these patients. Hospitals should be urged to consider admission of such patients with a diagnosis of alcoholism based upon the condition of the individual patient rather than a general objection to all such patients. Such objections have been very frustrating for physicians who wish to treat these patients and often discourages them from taking a greater interest in alcoholics.

The Council on Mental Health, therefore, urges hospital administrators and the staffs of hospitals to look upon alcoholism as a medical problem and to admit patients who are alcoholics to their hospitals for treatment, such admission to be made after due examination, investigation and consideration of the individual patient. Chronic alcoholism should not be considered as an illness which bars admission to a hospital, but rather as qualification for admission when the patient requests such admission and is cooperative, and the attending physician's opinion and that of hospital personnel should be considered. The chronic alcoholic in an acute phase can be, and often is, a medical emergency.

In support of the above statement, the Council is of the opinion that:

1. Alcoholic symptomatology and complications which occur in many personality disorders come within the scope of medical practice.

2. Acute alcoholic intoxication can be, and often is, a medical emergency. As with any other acute case, the merits of each individual case should be considered at the time of the emergency.

3. The type of alcoholic patient admitted to a general hospital should be judged on his individual merits, consideration being given to the attending physician's opinion, cooperation of the patient, and his behavior at the time of admission. The admitting doctors should then examine the patient and determine from the history and his actions whether he should be admitted or refused.

4. In order to offer house officers well-rounded training in the general hospital, there should be adequate facilities available as part of a hospital program for care of alcoholics. Since the house officer in a hospital will eventually come in contact with this type of patient in practice, his training in treating this illness should come while he is a resident officer. Hospital staffs should be urged to accept these patients for treatment and cooperate in this program.

5. With improved means of treatment available and the changed viewpoint and attitude which places the alcoholic in the category of a sick individual, most of the problems formerly encountered in the treatment of the alcoholic in a general hospital have been greatly reduced. In any event, the individual patient should be evaluated rather than have general objection on the grounds of a diagnosis of alcoholism.

It is recognized that no general policy can be made for all hospitals. Administrators are urged to give careful consideration to the possibility of accepting such patients in the light of the newer available measures and the need for providing facilities for treating these patients. In order to render a service to the community, provision should be made for such patients who cooperate and who wish such care.

In order to accomplish any degree of success with the problem of alcoholism, it is necessary that educational programs be enlarged, methods of case finding and follow-up be ascertained, research be encouraged, and general education toward acceptance of these sick people for treatment be emphasized. The hospital and its administration occupy a unique position in the community which allows them great opportunities to contribute to the accomplishment of this purpose. It is urged that general hospitals and their administrators and staffs give thought to meeting this responsibility.

Distinguished Service Award

The Board requests that members of the Association submit nominations for the recipient of the Distinguished Service award. If possible, these nominations should be received in the Secretary's Office by March 1 of each year.

Annual and Clinical Meetings

The following places and dates have been selected for the Annual and Clinical Meetings of the Association:

Annual Meetings: 1957—New York, June 3-7; 1958—San Francisco, June 23-27; 1959—Atlantic City, June 8-12; 1960—Chicago.

Clinical Meetings: 1956—Seattle, Nov. 27-30; 1957—Philadelphia, Dec. 3-6; 1958—Minneapolis, Dec. 2-5; 1959—Dallas, Texas.

Scientific Publications

The scientific publications issued by the American Medical Association include The Journal, which is published weekly, nine specialty journals that appear monthly, the Quarterly Cumulative Index Medicus, volumes of which appear twice yearly, and a number of books. Some of these books represent special projects of Association councils and committees. Others are collections of material appearing in an Assosiation publication or developed by a council or committee but put together in book form by another publisher. Included in this collection are a book of J. A. M. A. abstracts, Epitome of the U. S. P. and N. F., Fundamentals of Anesthesia, Glandular Physiology and Therapy, Handbook of Physical Medicine, Handbook of Nutrition, Japanese edition of The Journal, New and Non-official Remedies, Standard Nomenclature of Diseases and Operations, Tests and Standards for New and Nonofficial Remedies, and Useful Drugs.

The Journal of the American Medical Association

The activities of The Journal and of those departments associated with this periodical increased during the year. More material was published, and more income was derived from advertising. A comparison of 30 issues for 1956 and 1955 reveals that 5,226,338 copies were distributed during this period in 1956 and 4,870,321 copies during the same period in 1955. The advertising pages increased from 2,596 to 2,984 for this period. Net subscription receipts and advertising income likewise increased. The number of copies being printed each week is between 178,000 and 179,000. It is anticipated that the circulation will continue to increase in the months to come and the advertising pages will increase. This means, of course, that The Journal will increase in size because a ratio of about 50% editorial material and 50% advertising is followed for this periodical. At the same time, some printing and publishing costs have increased.

New sections and new ideas are introduced from time to time in The Journal. For example, during 1956 introductory summaries were begun for the original articles. These have resulted in wide acceptance and are reported to have increased readership for these articles. Other new features include guest editorials and articles particularly pertinent to health problems during the year, for example, the special collection of articles on the Olympic Games which appear in a November issue of The Journal. In the months to come there are plans to increase the reporting on activities of the Association and its councils, committees and bureaus and of other bodies which bear a relationship to American Medical Association interests. This reporting will feature the organizational side of the Association and will reveal what the doctors and others are doing to meet and solve health problems.

The Journal contained approximately 5,220 pages of editorial material during the past year—October, 1955, through September, 1956. Included in these pages were some 630 original articles and clinical notes. Some indication of the activities of the other departments of The Journal lies in figures such as those for the News Department, Medical Literature Abstracts, and Queries and Minor Notes. From July 1, 1955, to June 30, 1956, the News Department published 2,958 items and, in addition, 2,881 obituary notices. The Medical Literature Abstracts Department, which contributes from 12 to 18 pages of abstracts each week to The Journal, supplied material from approximately 1,200 publications received by the American Medical Association. Not all of these publications are regularly abstracted, but a selection is made from the world literature on the basis of their interest for the practitioner. This department also furnishes abstracts for the *A. M. A. Archives of Industrial Health* and translates documents and letters in foreign languages which are received from other countries. During the same 12-month period, 154 pages were devoted to Queries and Minor Notes in which were published 725 questions and answers and 87 comments relative to previously published notes. About 200 inquiries are received each month.

During 1956 a readership survey for The Journal was conducted by Ben Gaffin & Associates, Inc. This organization conducted a similar survey in 1950. The objectives of the survey were to determine present readership of The Journal and of its individual sections, to obtain reader appraisal of the value of each section and of the space devoted to it, to compare the current appeal of The Journal on the above points with the 1950 showing, to learn reader reaction to specific changes in The Journal made since 1950, to learn reactions to additional changes which might be considered, and to obtain suggestions from readers for further improvements. The summary of the findings reveals that The Journal is by far the most popular of all medical publications among physicians, even more so than in 1950. One of the most important attributes of The Journal apparently is its wide coverage of the medical field. Most of the readers are aware of the changes made in The Journal over the past years, and most of them think of these changes as improvements. In most respects The Journal today appears to be meeting the needs of its readers better than the survey revealed in 1950.

The Journal of the American Medical Association is now being printed at the McCall Corporation, Dayton, Ohio, because of the decision of the Board of Trustees and recommendations of the House of Delegates concerning printing facilities at Association headquarters. A number of problems arose during the transferral of printing operations and some of the early issues of The Journal were not as satisfactory as either the editorial department or the printer would have desired. However, these problems are being quickly resolved and it is anticipated that an even better product, particularly concerning the use of color, will be available soon.

Specialty Journals

The Specialty Journals Department has devoted the greater part of the past 12 months to aiding in the negotiation of a printing contract, and to transferring its manufacturing operation to the new printer.

Much effort has gone into increasing the production of the editorial department to meet the advanced schedule established by the printer. When working with the Association's print shop, the editorial department was pressing toward the submission of copy to printer one month prior to publication. Under the new schedule, copy for the first of nine journals is reaching the printer 10 weeks before date of publication. It is desirable that this schedule be advanced an additional month so that one issue of each journal will always be standing in page proof form. This advance schedule has been met with no increase in the editorial staff. Much credit is due the chief editors and the editorial boards of the specialty journals for their cooperation in securing sufficient manuscript copy to make the advanced editorial schedule possible. Adjusted to a flow of copy necessary for the previous operation, they were confronted with the task of furnishing adequate material for the manuscript editors to double their output.

During the first eight months of 1956 the specialty journals published 850 original articles, 19 progress reports or general reviews, 104 case reports or clinical reports, 8 special articles, 23 scientific exhibits, and 17 editorials, or a total of 1,021 articles. The total of unpublished articles for all specialty journals is 720. It is anticipated that about 550 more papers, including original articles, progress reports, general reviews, case reports, clinical notes, special articles, scientific exhibits, and editorials, will be published during the remainder of 1956. It is anticipated that all nine journals will be published the first week of each due month. Present indications are that this schedule will be met with the October, 1956, issues. The first few numbers under the new arrangement have been delayed due to the many ramifications of transferring the printing operation.

The specialty journals are undergoing careful analysis by an expert in typography and journal design. This service is provided by the new printer without cost. Upon approval, the improvements recommended will be incorporated into the publications.

The specialty journals are in a position to offer readers superior quality in color reproduction. A year ago these journals became interested in a new color process which previously was confined to advertising needs. Today this process is providing realistic color of diagnostic significance. Limited to one or two journals at the present, it is anticipated the use of color will spread to other specialty journals.

The circulation of each specialty journal has been analyzed with a view to developing a promotion program with direction. The analysis, carefully studied and interpreted, can also be of editorial significance. The combination of improvement in circulation, subject appeal, attractive appearance, and format should enhance the possibility of increased advertising revenue.

Arrangements have been concluded for the sale of back copies of the specialty journals, two years or more old, through a concern specializing in this type of publication. This is a continuation of a service formerly offered by the Association's Order Department. An added service has been developed for the specialty journals subscriber. Through the cooperation of a specialized bindery with the Association, a subscriber service is available which provides a bound volume of six unused issues of a specialty journal. This service eliminates the necessity of collecting monthly issues, replacing lost numbers, and packing and shipping to the bindery.

More stabilized journals, thus resulting in a better controlled manufacturing budget, adjustments in accounting procedures, increased subscription and advertising revenue, and a general leveling off on a monthly manufacturing basis have contributed greatly to a most favorable financial trend in the publishing of the specialty journals.

Quarterly Cumulative Index Medicus

Two volumes of the Index have been printed this year as usual. Volume 53 (January-June 1953) was mailed last October and Volume (July-December 1953) in February.

Although a number of periodicals were removed from the lists of those indexed, leaving approximately 950, these volumes were larger than previous issues, running to 1,775 and 1,761 pages, respectively. Nineteen journals were added in volume 53, 13 of these being new publications; 18 journals were added in volume 54, half of them new. Volume 53 included almost 33,000 articles, volume 54 about 32,650; 116,350 cards, exclusive of cross references, were typed for the former and 110,940 for the latter. Volume 53 covered 16,340 articles in English, 5,180 in German, 4,365 in French, 3,115 in Italian, and 1,945 in Spanish. Volume 54 included 16,350 articles in English, 5,127 in German, 3,355 in French, 3,287 in Italian, and 2,249 in Spanish.

By the end of the 12-month period all the editorial work on Volume 55 (January-June 1954) had been completed, and editing of copy for the next volume was started.

During the year an Associate Editor with experience in medical editing and indexing was employed. As a result it is expected that the accomplishment for next year will be improved.

As evidence of continued interest in the Index, the following items are significant: The number of paid subscriptions is still 4,500 in spite of the delay in publication; the Quarterly Cumulative Index Medicus was one of the chief medical reference tools discussed in a recent symposium on medical bibliography; according to information received recently, the new edition of World Medical Periodicals will carry the initials "QC" after each journal included in the Index.

Circulation

The circulation of The Journal, the nine specialty journals, and the Quarterly Cumulative Index Medicus increased with each issue during the fiscal year ending June 30, 1956. The net gain in the average weekly paid circulation of The Journal was 1,646, and the growth continued to the point where the net paid circulation for the June 30, 1956, issue was over 173,000.

Subscribers not receiving one of the scientific periodicals as a benefit of paid American Medical Association membership dues are required to pay their subscriptions in advance. Expiration notices are also sent in advance, with a series of three renewal reminders mailed at regular intervals. All subscriptions are terminated upon expiration if a paid renewal order has not been received. This policy has stabilized the circulation and improved the renewal percentage.

With the continuation and expansion of promotion activities, it is planned to increase the average net paid circulation of each issue of The Journal to 178,000. It is hoped that these promotion activities will also increase the average net paid circulation of the other scientific periodicals.

The major portion of the subscription fulfillment activities is now performed under contract with McCall Corporation, printers and mailers of The Journal. That company's experience and mass production facilities will expedite the processing of subscriptions and will continue to contribute to increasing the service to members and subscribers.

Standard Nomenclature of Diseases and Operations

There have been several changes in the office of the Standard Nomenclature of Diseases and Operations in the past year. In January, 1956, Dr. Richard J. Plunkett resigned the editorship of the Nomenclature to assume the position of Associate Director for Administration, Joint Commission on Mental Illness and Health. In February, 1956, the Board of Trustees appointed Dr. Edward T. Thompson, Chief, Operations Branch, Division of Hospital Facilities, Public Health Service, Washington, D. C., Editor of the Nomenclature. Dr. Thompson has served as a member of the Editorial Advisory Board since 1948.

The Standard Nomenclature of Diseases and Operations has progressed rapidly in the past few months. The Respiratory Committee, Dentistry, Ophthalmology, Female-Genital System, Urology, and Anesthesiology Committees have all presented their first reports, including changes, additions, and deletions for their respective sections. These changes have been made in the Nomenclature. Work is being conducted on the revision of the neurology and operations sections. Categories three and eight of the etiologic section are also being revised to conform with modern scientific progress. The fifth edition of the Nomenclature is being simplified thus making the Nomenclature a smaller and more comprehensive volume. The publication date for the fifth edition will be approximately Jan. 1, 1962.

An educational exhibit on the Standard Nomenclature explaining the organizational set-up was displayed at the American Hospital Association meeting in Atlantic City, N. J., the American Association of Medical Record Librarians meeting in Chicago, and the American Medical Association Annual Meeting in Chicago. There is a definite trend toward the installation of the Nomenclature in doctors' offices, clinics, and pathology laboratories in addition to new hospital installations. Approximately 3,000 queries have cleared through the headquarters office since October, 1955. Approximately 39,350 copies of the fourth edition of the Standard Nomenclature of Diseases and Operations have been sold to January, 1956.

The American Medical Association has sponsored and conducted 3 three-day Standard Nomenclature Institutes in Atlantic City, N. J., New York, and Association headquarters in Chicago this past year. The American Medical Association-sponsored institutes are tuition-free, and the lectures are designed to accommodate beginners, intermediates, and advanced students. Medical record librarians, clinic clerks, doctors' secretaries, receptionists, nurses, and doctors enroll in these institutes. The applications for each institute far exceeded facilities available for teaching. Due to the fact that it is necessary to limit registration at the Institutes, 360 students were accommodated and 400 refused. Standard Nomenclature Institutes are in the planning stage to be held in Roanoke, Va., San Francisco, and at headquarters during the coming year. The Standard Nomenclature Institute teaching is under the direction of the editors of the Nomenclature. In addition to the Institute teaching, the Associate Editor has lectured on Standard Nomenclature in Virginia, New York, Illinois, Michigan, and Indiana.

The Editorial Advisory Board for the fifth edition of the Nomenclature appointed by the Board of Trustees consists of Drs. George Baehr, Chairman, New York; Edwin L. Crosby, Chicago; Selwyn D. Collins, Washington, D. C.; Austin Smith, Chicago; and Edward T. Thompson, Washington, D. C., Editor, and Adaline C. Haydon, C.R.L., Chicago, Associate Editor.

Library

This year has seen the completion of two projects, one of which was mentioned in the last report. Reorganization of the book collection was finished with the withdrawal of older items and a complete revision of catalog and shelf card files. New titles are being added with special attention given to gaps left in certain fields by the weeding process. It is expected that as a result the library will soon have a well-rounded collection of books suitable to its needs.

The second undertaking was weeding the reprint collection to remove obsolete material, and rearranging and labeling the folders to make the file much more usable and accessible. Also, a number of additional periodicals were available for mutilation, often making it possible to include the latest articles in packages. These changes have speeded the collecting and processing of package libraries.

In spite of the time required to revise both these collections the Library staff has handled as much reference work as last year. Under the supervision of the new reference librarian the backlog of requests has been eliminated, and letters are being answered more promptly than formerly. Requests are seldom held more than 48 hours before a package or a list of references is in the mail, and in emergencies material is often sent on the day the letter arrives.

The Periodical Lending Service has handled 12,825 separate periodicals; 3,660 of these were included in package libraries and 2,250 loaned to other departments and persons in the headquarters building. If journals are available, they are ordinarily mailed to the borrower within a day after his order arrives.

Two staff members have prepared the indexes to volumes of THE JOURNAL as usual. According to comments from various sources these indexes are widely used as a quick source of information on many topics since THE JOURNAL offers such broad coverage of the whole field of medicine.

A new arrangement has been made for disposing of the periodicals discarded at the close of each year. Most of the titles are now given to the Midwest Inter-Library Center in Chicago where they are available for consultation should need arise.

The records of periodical acquisitions for the year show that 167 new titles were received, 70 of them first issues. Only 25 of the 167 journals received were assigned to the Quarterly Cumulative Index Medicus for indexing, but 45 more will be reconsidered when a wider coverage is contemplated.

Today's Health

EDITORIAL DEPARTMENT:

Manuscript purchases have been cut to the bone. Nineteen articles are now rejected for one accepted, despite the appreciable rise in over-all quality of material submitted. Currently an average of 175 articles are submitted each month. This is in addition to about 70 pieces of verse and 910 cartoons, spot drawing, and photographs including color, of which about one in 30 is accepted. This testifies to the rising interest in *Today's Health* among competent writers, artists, and photographers.

Unfortunately in the financial sense, but most fortunate for the welfare of the magazine, the reduction in spending for articles falls short of the drastic cut in the quantity purchased. The reason is that only work is purchased that the magazine cannot afford to turn down and, within its limitations, must pay for in proportion to quality.

In addition to constant corner-cutting in the purchase of art—and "art" includes all forms of graphic material and even art supplies—the size and complexity of illustrations, the use of color and "bleeds" have been judiciously but markedly reduced. Art work has been held to styles permitting the most routine and therefore least expensive type of reproduction. While this practice makes a difference in the appearance of the magazine, it has been done with insistence on maintaining variety within those restrictions and with taste and ingenuity. It has not been costly in respect to quality. Editorial costs, December through June, were running $4,000 under budget and $5,600 under the same period last year.

Outside reader research and consultation services, already curtailed, were discontinued at midyear, partly for economy and partly because it was felt that the cream of what the present editorial consultants, who have been of material help, could tell us had been obtained. It is the consensus of the *Today's Health* staff, however, that to abandon outside editorial research and consultation would be false economy, and current plans are to resume it next year with new consultants and a fresh viewpoint.

The effectiveness of *Today's Health* covers have been markedly enhanced by an innovation that started with the September, 1955, issue. Every cover now is an illustration designed to interest the reader in the leading article in that issue, and often the cover bears several subordinate illustrations, each promoting an outstanding article. The words, "Published by the American Medical Association," formerly at the bottom of the cover, are displayed in large type across the top. Research studies have demonstrated that American Medical Association identification is an asset to the magazine, and the soundness, interest and helpfulness of the magazine are a prestige and good will asset to the Association.

A broader editorial scope has been adopted. Article topics have ranged from Christmas to drug addiction and have included auto and traffic safety, the plight of the dieters eating out, epilepsy and marriage, foot care, growing old gracefully, wage-earners' and school lunches, biological warfare, heat, learning to swim, the advantages in time, effort, cost and nutrition of packaged meals or prepared foods against fresh foods, noise, transistor hearing aids, the schools, teen-agers, civil defense, and so on. A cumulative index of all articles published in *Today's Health* (1950 through 1955) is available through the office of the Managing Publisher.

Today's Health is attracting contributors of distinction: Corcoran and Page on blood pressure, Feinberg on allergy, Davidsohn on the Rh factor, Behrens on vision, Cameron on cancer, Bortz on digestion, Desmond on the aged, Fabricant on headaches; from government, Surgeon General Scheele, Commissioner of Education S. M. Brownell and Civil Defense Commissioner Peterson; among professional writers, Blakeslee of the Associated Press, Geiger of *INS*, Ubell of the *Herald-Tribune*, Paul de Kruif, Ida Bailey Allen, Bruce Bliven, Amram Scheinfeld and Rebecca Reyher.

Eleven publications, ranging from *Coronet* magazine to an encyclopedia, paid $1,526 to reprint 34 articles from *Today's Health*, in addition to complimentary permission to 132 publications to reprint 168 articles. In the preceding twelve months, nine publications paid $1,020 for permission to reprint 29 articles, and complimentary permission was granted 84 publications to reprint 137 articles. Twenty-four *Today's Health* articles were reprinted by the Bureau of Health Education. Taking these figures at face value, they indicate a marked rise in the interest of material published in *Today's Health*. A soft-cover collection of 58 outstanding *Today's Health* articles, is to be published in January, 1957, as a Dell First Edition, and will be available nationwide about the end of that month on the 100,000 bookracks where Dell Books are sold. The publisher, one of the most respected in the field, describes it in terms that many readers seem to feel fit *Today's Health*: "A simple, hopeful book that everyone interested in healthier, happier living can use and understand."

CIRCULATION DEPARTMENT

The circulation of *Today's Health* continued at a high level through the 12-month period, despite a decided drop in new subscriber promotion activities. The average net paid circulation for the period from July, 1955, through June, 1956, was 339,888.

A survey of the classification of the subscribers who received the May, 1955, and the May, 1956, issues produced the following percentages:

Subscriber Classifications	Percentage of Total of Paid Subscriptions	
	May, 1955	May, 1956
Lay subscribers	59.1	70.5
Nurses	1.9	3.9
Physicians	18.2	8.1
Dentists	8.5	3.7
Hospitals	0.6	1.7
Schools, teachers	6.6	7.0
Public libraries	1.5	1.5
Clergymen	0.5	0.6
Miscellaneous	3.1	3.0

The change in the number of copies going into the offices of physicians and dentists resulted from the fact that no special emphasis was given to this category in the 1955-1956 Woman's Auxiliary subscription project. The auxiliaries concentrated on school, library, laity, and gift orders. Local and state medical society auxiliaries produced orders for 57,792 subscription years in the 1955-1956 project, which is an increase of 4,577 over the previous fiscal year and the highest number of orders ever produced through the efforts of the medical society auxiliaries. The 1956-1957 goal is 75,000 subscription years, and the national, regional, state and local auxiliary projects will use as their theme: Increased Reception Room Readership, with more subscriptions for physicians' and dentists' reception rooms.

Special advertisements and insert order forms are enclosed in all issues so that waiting patients, school, and library readers have an opportunity to subscribe to the magazine after becoming acquainted with it. The placing of *Today's Health* in physicians' and dentists' reception rooms helps to increase the percentage of returns in our Fall and Winter direct mail promotion efforts for new lay subscribers because a large percentage (approximately 33%) state that they subscribed to the magazine after seeing it for the first time in their doctor's waiting room.

The rising renewal percentage on subscriptions reflects a wider acceptance of the magazine and a healthy growth of interest by the laity. A comparison of the renewal percentages for the last two fiscal years shows:

July 1, 1954 thru June 30, 1955	*July 1, 1955 thru June 30, 1956*
42.0%	55.2%

This renewal percentage compares favorably with national magazines such as *Look*, *Life*, *Collier's*, and *Newsweek*, which are happy to approach a renewal percentage of approximately 48 percent.

In addition to the 24,346 schools and teachers who regularly subscribe to the magazine, 65 high schools and colleges used *Today's Health* in the classroom under the magazine's Group Study Plan during the 1955-1956 school year. An average of 2,638 copies per month were used in these schools and were supplied at a special bulk rate for quantity orders, including a monthly list of discussion topic questions and answers prepared by the Bureau of Health Education. Actually, an average of 26,984 copies per month were received by students and teachers during the last school year, and as each copy is normally used by more than one student and class, it is obvious that the magazine reaches a very large audience of high school, college, and university students.

Today's Health has been displayed at 10 national conventions this past fiscal year and sample copies, promotion circulars and subscription forms have been distributed to professional and health education leaders and personnel at the following meetings:

American Association for Health, Physical Education and Recreation, NEA
American Association of School Administrators, NEA
American Dental Association
American Library Association
American Nurses Association
American Public Health Association
National Education Association
Annual American Medical Association
Clinical American Medical Association
Student American Medical Association

Group subscriptions ranging from 10 to 1,200 copies have been received from industrial and business firms, and it is expected that the wider recognition of the health education value of *Today's Health* by industrial physicians and industrial and business leaders will stimulate this project. Also, many of the nation's leading railroads, airlines, and steamship lines are placing the magazine in the lounges of their passenger carriers.

The major portion of the subscription fulfillment activities are now performed under contract with McCall Corporation, the printers and mailers of the magazine. Making use of their experience and mass-production facilities has expedited the processing of subscriptions and is contributing to increasing the renewal potential.

ADVERTISING DEPARTMENT

Advertising promotion and merchandising services were intensified during the fall of 1955, and this resulted in increased billing. That billing decreased during the first six months of 1956 but is again on the upswing. It might be mentioned that the circulation guarantee for advertisers was raised from 220,000 to 330,000 in July of 1955. This made possible a 20% increase in advertising rates.

Perhaps the most significant promotion activity of the Advertising Department was a survey made in February, 1956, designed to show the use of *Today's Health* in physicians' waiting rooms. Of the 60,140 physician subscribers it is known that 98.2% put the magazine in their reception rooms. It is also known that these physician subscribers see 27,664,400 office patients each month, 331,972,800 each year. Further facts relating to age and sex characteristics of the patients, age and location of the physician, type of practice, etc., were established. Further research along this line, but concentrated on other segments of the *Today's Health* audience, is contemplated.

Advertising revenue is still territorially out of balance, in that approximately 60% of total volume is coming from the Midwest and only 35% from the East. It is hoped that the addition of an experienced, full-time *Today's Health* representative to the New York staff will correct this situation.

The advertising feature Helpful Hints for Better Living came into its own during the period covered by this report. This monthly feature gives the reader an opportunity to request additional information about advertised products, and during the Spring of 1956 the monthly inquiry total ranged between 16,000 and 20,000.

While *Today's Health* is basically a consumer publication, it is interesting to note that perhaps its best immediate potential for increased advertising sales comes from the pharmaceutical industry. That industry is, for the first time, promoting "over-the-counter" items, and has established a committee to develop a national public relations (education) program. *Today's Health* is being used as a springboard or base for several consumer campaigns and prospects are good that more will be forthcoming.

MECHANICAL PRODUCTION

Early in 1956 the *Today's Health* Production Department was established. A production coordinator was appointed to serve both the advertising and editorial departments and at the same time maintain proper control over printing, engraving, and paper costs. Many of the economies effected by the Editorial Department are reflected in decreased production costs. Furthermore, it is encouraging to note that over-all production costs this year are considerably below those of last year even in the face of increased printing and paper costs.

ADMINISTRATIVE DEPARTMENT

The most significant activity of the Administrative Department during the past year was the development of monthly (financial) operating statements for all *Today's Health* departments. These reports are invaluable to management and to the individual department heads from the standpoint of cost control they reflect operating statistics never before available. For the fiscal year 1955 approximately $80,000 was cut from the anticipated deficit and at the same time nearly 1,000,000 more copies of the magazine were printed than in the previous 12-month period. In March, 1956, it became obvious that an alternate 1956 budget should be established. This alternate plan has made it possible for *Today's Health* to remain within the bounds of its present budget. The fine cooperation of *Today's Health* department heads has made the plan work.

The Managing Publisher presented a recommendation to the American Medical Association Board of Trustees in June, 1956, to the effect that *Today's Health* be established as a separate entity within the operational framework of the Association. At the writing of this report no action had been taken by the Board.

Report of Law Department

This report covers the activities of the Law Department from July 1, 1955, to June 30, 1956. During that period the department continued to operate as the coordinating agency for the legal activities of the Association and in addition maintained its interest in the field of forensic medicine. It has expanded its work with state and county medical societies and increased its efforts in arranging joint programs with the legal profession at the national and state level.

The department has continued to provide staff assistance and to work closely with the Judicial Council, the Committee on Legislation, the Council on Constitution and Bylaws, and the Committee on Medicolegal Problems in the implementation of their respective programs. Inasmuch as separate reports will be filed by each of these councils and committees, no further comment will be made here regarding their operations. The Director would, however, like to express his sincere thanks and appreciation to the chairmen and members of each for the full cooperation and the pleasant working relationship that has prevailed.

General Legal Affairs

Under the direction of the Secretary and General Manager, the department has continued to act as the principal legal adviser to the Board of Trustees, the House of Delegates, the officers and the executive staff of the Association. The legal issues involved in this work are comparable to those facing any corporation as large and with as many and varied interests as the American Medical Association. Included are questions involving antitrust law, contracts, taxes, leases and the law of copyrights, trade-marks, libel, slander, and insurance.

In association with outside legal counsel, the department provides legal protection for the Association through (1) advice designed to prevent liability; (2) proper legal defense if sued; and (3) affirmative legal action if injured by another party or organization.

The members of the staff of the department have worked in close cooperation with outside counsel in connection with four cases currently pending in which the Association is involved. Assistance has been rendered in the assembling of background information, the taking of depositions, and in other ways in the preparation of these cases for trial.

Liaison Activities

Intraassociation Work.—The success of the closer liaison that has been established between the Law Department and the various councils, committees, departments, and bureaus of Association has been particularly gratifying. As indicated in the last annual report of the department, each of the attorneys on the staff has been assigned responsibility for maintaining liaison with, attending the meetings of, and advising the members and staff of specific councils and committees.

In addition to the permanent councils and committees of the Association, there are a number of temporary committees and subcommittees that have received legal and, on occasion, administrative assistance from the department. The assistance given to these committees, some of which are listed below, has varied considerably. Included is legal research, the preparation of reports and opinions, participation at meetings, and the answering of legal questions arising out of their deliberations. The Director of the department has participated as an active member of the first six of the following committees:

Committee on Scientific Councils
Advertising Committee
Committee on Medicolegal Problems
Committee on Dependent Medical Care
Joint Committee with the American Bar Association on Narcotic Addiction
Task Force on Rehabilitation
Committee on Medical Practices
Commission on Medical Care Plans
Committee on Graduates of Foreign Medical Schools
Committee on Specialists in Other Fields
Committee on Physician-Hospital Relations
Committee on Grievance Committees
Committee on Liaison with Labor and Management
Inter-Association Committee on Health
Committee on Medical and Related Facilities
Commission on Medical Care Plans
Committee to Review Functions of Joint Commission on Accreditation of Hospitals
Committee on Federal Medical Service

State and County Medical Societies.—In addition to liaison activities within the Association the department has through correspondence and personal visits established and maintained active contact with the executive secretaries and the legal counsel for state and and county medical societies. Representatives from the department have, on request, spoken on medicolegal subjects on innumerable occasions, at state and local medical meetings, and at joint medicolegal conferences. The staff of the department has also shown and explained exhibits on Medical Professional Liability and the Drunken Driver at state and county medical meetings.

In the opinion of the department one of the most significant and successful activities during the past year was the planning and conducting of the first national conference for attorneys and executive secretaries of state and county medical societies. The purpose of the meeting was to discuss mutual legal problems of organized medicine and to consider several recent court decisions of particular importance to medical societies. The meeting, which was attended by 93 attorneys and executive secretaries, proved to be a valuable postgraduate course in those branches of the law most frequently encountered by legal counsel for state and county medical societies. During the two-day meeting, 27 speakers presented papers and answered questions on the following six subjects:

Organized Medicine and the Antitrust Laws
Corporate Practice of Medicine
Grievance Committees and Disciplinary Proceedings
Medical Professional Liability
Interprofessional Codes of Conduct for Physicians and Attorneys
Legislation, Lobbying, and Tax Problems

On the basis of the reaction of the participants at the meeting it has been decided to sponsor the conference every two years.

The department has worked closely with individual physicians, medical societies, and allied health associations in explaining and clarifying the policies and programs of the Association and in seeking internal and outside support in the implementation of common objectives of the medical profession and allied groups.

Although a statistical record has not been kept of the number of letters received and answered by the department, there is no doubt that several thousand were processed during the period of this report. These letters from individual physicians, attorneys, state and county medical societies, and outside organizations deal with a wide variety of problems in the medicolegal field.

Preparation or Review of Published Material

The department has continued to work closely with the editors, the managing publisher, and the staffs of The Journal, the specialty journals, and *Today's Health* in preparing special articles, book reviews, and editorials. Assistance has also been provided in reviewing material submitted from other sources that might have legal implications.

The following list indicates the material prepared by the Department and the dates of publication:

Hospital Staff Privileges Contingent Upon Membership in County Medical Society	July 23, 1955
Blood Transfusion—Sale or Service	Aug. 20, 1955
Medicolegal Symposiums	Sept. 24, 1955
Medicolegal Aspects of Tissue Homotransplantation	Oct. 1, 1955
Publication of Precedent Opinions of the Judicial Council	Oct. 15, 1955
Hospital's Liability for Negligence of Laboratory Technician	Dec. 3, 1955
Group Medical and Hospital Service Plan: No Violation Found	Dec. 10, 1955
Court Holds Iowa Hospitals Engaged in Illegal Practice of Medicine	Jan. 7, 1956
Federal Income Tax: Deduction of Expenses Incurred in Taking Postgraduate Courses	Feb. 4, 1956
Report on Study of Professional Liability Insurance and Prevention Program	Feb. 4, 1956
The Tissue Committee	April 7, 1956
Committees for the Review of Medicolegal Testimony	April 14, 1956
Mutual Understanding Between Physicians and Attorneys	April 21, 1956
Publication of Precedent Opinions of the Judicial Council	June 9, 1956
In the Matter of the Appeal of Dr. Charles E. Bolinger to The Judicial Council of the American Medical Association	July 7, 1956
Tax-Deduction Expenses for Education	July 28, 1956
Internal Revenue Service Rejects Kintner Case as a Precedent	Aug. 11, 1956
The Presumption of Legitimacy and Laches in Relation to the Denial of Paternity	Aug. 11, 1956

The department also assisted in the preparation and in the negotiation of contracts incident to the transfer of the printing of The Journal and the specialty journals from the Association to the McCall Corporation of Dayton, Ohio, and the Baird-Warner Printing Co., Inc., of Nashville, Tenn.

Medicolegal Relations

The department has greatly accelerated its efforts in the field of medicolegal relations to meet what it considers to be a growing desire on the part of the legal and medical professions to join in a sincere cooperative effort to settle the real and imagined differences that exist. It has encouraged and participated in joint medicolegal conferences at the national, state, and local levels. Assistance has also been provided in the negotiation of written codes of understanding. These codes now exist in Cincinnati, Ohio; Maricopa County, Ariz.; Louisville, Ky.; Minnesota; Oregon; Pennsylvania; Utah; and Wisconsin.

Regional Conferences.—The department in cooperation with the Committee on Medicolegal Problems staged a series of three regional medicolegal symposiums last fall. Over a thousand physicians and lawyers from 20 states attended these meetings, which were held in Chicago on Oct. 9, in Omaha on Oct. 16, and in New York City on Oct. 30. They were the first joint meetings of members of both the legal and medical professions organized and sponsored by a national organization.

In developing the theme of the conferences, it was agreed that lawsuits are adversary proceedings and that conflict is a major element in the medicolegal field. Discussions and papers presented from the viewpoint of each profession proved that doctors and lawyers are both attempting to obtain the best results from individual and professional efforts. In presenting the view of medicine or law, every effort was made to clarify misunderstandings, not for the sake of understanding alone, but as a means to an end—the welfare of the individuals served, whether identified as patients, clients, or the public. At each meeting three broad areas of medicolegal relations were considered: medicine's contribution to the administration of justice; mutual medicolegal problems as viewed by each profession; and a demonstration showing a medical expert witness under proper and improper courtroom conditions.

In the area of the administration of justice there were provocative discussions on traumatic neurosis, trauma, and disease, medical expert testimony, and medical science in the administration of criminal justice. In the area of medicolegal problems there were discussions of the several aspects of professional liability, a consideration of the professional man as a taxpayer, and an exploration of the best methods to insure unbiased medical expert testimony. The balance of each session was devoted to the questioning of a medical expert witness in a two-part mock trial demonstration. In the first part of the demonstration the medical witness had not been prepared in any way for the role he was to play. He had poorly prepared himself and had not been adequately advised by the attorney for whom he testified. As a result he was laid open to a cross-examination that destroyed the credibility of his testimony and made him appear something less than an expert in his specialty. The same witness in the same factual situation was then characterized as a thorough and capable physician. He had conducted a complete physical examination of the individual, and his testimony was objective and factual. Because of preparation he was not subject to a successful attack on cross-examination. The department is indebted to Dr. Ralph E. DeForest, Secretary of the Association's Council on Medical Physics, who acted as the witness in this demonstration.

Medicolegal Conference: State and Local.—Since the last of the regional meetings, a number of requests have been received to present the expert witness demonstration at medical and legal meetings in all parts of the United States. During the period covered by this report, the demonstration has been presented on 10 occasions to over 5,000 physicians and attorneys. It is scheduled for presentation on four more occasions this year, the final showing to be given at the annual meeting of the American Academy of Orthopedic Surgeons.

Projects of Medicolegal Significance

During the year the department planned, developed, and directed a number of major medicolegal projects of substantial importance to the medical profession and the Association.

Establishment of Independent Commissions and Foundations.—The department participated in the establishment of new and independent corporate entities to handle the activities of the former State Journal Advertising Bureau and to examine foreign-trained medical students.

Model Post-Mortem Examinations Act.—In cooperating with the Committee on Medicolegal Problems the department has worked actively in support of the Model Post-Mortem Examinations Act as approved by the National Conference of Commissioners on Uniform State Laws. Speakers have been provided on several occasions to explain and discuss the provisions of the model law and the advantages of the medical examiner over the coroner system.

Medicolegal Film Project.—The department has coordinated the efforts of representatives of the American Bar Association, the American Law Student Conference, the Junior Bar Conference, the Association of American Law Schools, the Association of American Medical Colleges, the Student American Medical Association, and the American Academy of Forensic Sciences in the planning and production of a series of six medicolegal films dealing with such subjects as the doctor as a medical expert witness, medical science in the administration of criminal justice, medical professional liability, and chemical tests for intoxication.

Corporate Practice of Medicine.—The review of state statutes and court decisions dealing with the corporate practice of medicine prepared by the former Bureau of Legal Medicine and Legislation in 1949 was brought up to date to include all recent decisions, state statutes, and attorneys general opinions. This 46-page booklet has been distributed to all state and large county medical societies and is available upon request.

Compilation of State and Federal Laws.—The department has maintained a current compilation of state and federal laws, as well as pertinent regulations dealing with medicolegal affairs, taxes, workmen's compensation, and other areas of law involved in the activities of the Association.

Medicolegal Forms.—Preparation has been started on a set of medicolegal forms for use by the physician and his legal counsel. This set of over 50 forms, with accompanying legal analysis and case citations, will be published in The Journal and later in book form.

Study of Medical Professional Liability

In accordance with the request of the Board of Trustees and the House of Delegates, the Law Department has continued its study of medical professional liability. All of the facets of this survey referred to in our last report have been initiated and some have been completed.

1. A comparative analysis of state insurance laws and regulations in the professional liability field has been completed.

2. An investigation, by use of a questionnaire, of the experiences of state medical societies with group professional liability insurance and claims prevention programs has also been completed.

3. An opinion survey of 5% of the members of the Association (7,500) has been initiated to determine professional liability claims experience of the profession, the views of physicians on numerous aspects of the problem, and their suggestions as to a valid prevention program. The responses when tabulated should give an indication of the number of claims and suits that have been brought against physicians, the amount of professional liability insurance, if any, carried by physicians, and a consensus of opinion as to the best way to cope with professional liability claims and suits. All of this information will be broken down by age group, medical specialty, and geographical location.

4. An analysis of all reported cases that have been litigated during the past 20 years is completed. Information from these cases, about 750, is being broken down to show complete information concerning the patient, the parties to the litigation, the time and nature of the alleged malpractice, the number and types of medical witnesses, and complete information as to the disposition of each case.

5. Fifteen physicians and attorneys have been asked to write articles on various aspects of medical professional liability. We plan to publish each article, several of which have already been received, in a separate issue of The Journal. Thereafter, all the articles will be reproduced in booklet form.

6. Thirty-one of the known insurance companies writing professional liability insurance in the United States have been contacted and requested to cooperate with us in this survey. These companies have been asked to supply extensive statistical data relative to professional liability claims and suits. To date, with the assistance of the Council on Medical Service and the National Bureau of Casualty Underwriters, liaison has been established with many of these companies. It is our opinion that the insurance industry can make a valuable contribution to the survey by furnishing information which to date has not been available on a national basis.

7. A detailed study of the statutes of limitation of each state relating to medical professional liability suits has been completed.

8. Letters have been sent to the armed forces, Veterans Administration, U. S. Public Health Service, and the Department of Justice in an effort to obtain information on the causes, number, and disposition of professional liability claims and suits against government physicians, as well as the role the government is playing in assuming responsibility.

The department is confident that its survey of professional liability when completed will provide the basis for a complete and up to date statistical report and will supply sufficient material and information on which to formulate a sound long-range educational program of prevention for both the legal and medical professions.

Optometric Study

At the request of the Judicial Council, the Law Department has begun a review of the scope of optometric practice as well as current legislative and legal trends in this field. This study involves a review of national statutes and proposed legislation, state statutes and bills, and current decisions dealing with the scope of optometry and ophthalmology.

Postgraduate Medical Expenses: Tax Deductions

Since the beginning of federal income taxes in the United States, the expenses of industry in keeping abreast of scientific and technological developments have been considered as proper deductions. Yet similar expenditures on the part of practicing professional men in attending educational courses dealing with current developments in their professions have been disallowed. The specific question as to whether a practicing lawyer who handles tax matters may deduct expenses of tuition, travel, and board and lodging incurred in attending a series of lectures on federal taxation was considered by the courts in a recent case. The ruling of the court recognized the validity of a tax deduction for a professional man's expenses in taking educational courses to keep abreast of current developments in his field of practice. Although it would seem that the court's decision should have settled the question, some Internal Revenue agents arbitrarily took the position that it did not apply to physicians. Others limited the application of the decision in a discriminatory manner. For this reason it was felt that the resulting confusion and inequity could be remedied only by a regulation clearly recognizing postgraduate educational expenses of practicing physicians as a valid tax deduction. After numerous requests by the Law Department of the Association and by others, the Commissioner of Internal Revenue has now issued a "proposed" regulation. From a practical standpoint it is now effective, although there will be some clarifications in language before it becomes final. We believe it will grant needed tax relief and encourage practicing physicians to take short courses that will keep them current in medical knowledge and techniques with the assurance that the expenses involved are proper items of business expense. The Law Department has analyzed the regulation and has presented suggestions to clarify some minor ambiguities in language.

Medicolegal Abstracts

The Law Department has continued the work of preparing abstracts of court decisions in the medicolegal field. Some of these abstracts have appeared in The Journal from time to time, while others have merely been indexed and are being held for inclusion in the next permanent volume, which probably will include abstracts prepared during the period 1953-1957. References to a few of the cases abstracted and published during the period covered by this report are given below.

The Supreme Court of Illinois (Amaan v. Faidy, 114 N. E. [2] 412) overruled a 1900 decision and held that the estate of a viable child who suffered prenatal injuries and was thereafter born alive has a right of action against the person whose alleged negligence caused the injuries. The Supreme Court of New Jersey (Greenspan v. Slate, 97 A. [2] 390) held that a physician who renders medical services in an emergency to a minor child may recover from the child's parents the reasonable value of those services. The district court of appeals of California (Rosenberg v. Feigin, 260 P. [2] 143) indicated that it is not malpractice for a physician to render care and treatment according to accepted standards to a wife who has requested and consented to such care and treatment without first having obtained the consent of the husband. The Supreme Court of Louisiana (Katz v. Bernstein, 65 So. [2] 331) admitted that ability to pay is a valid criterion for setting medical fees but indicated that there must be adequate proof of the wealth of the patient to support the fee charged. The Supreme Court of Wyoming (Wright v. Wyoming State Training School, 255 P. [2] 211) decided that the contracting of dermatitis venenata by a nurse's aid in a school dispensary is an accident within the meaning of the workmen's compensation act for which she is entitled to an award. The Supreme Court of Pennsylvania (Powell v. Risser, 99 A. [2] 454) reaffirmed the general rule that a physician is not liable for injury to a patient that occurs as a result of nursing procedures, the procedure in this case being the application of wet-pack treatments to patients whose mental condition renders them violent.

The Supreme Court of the United States (Orloff v. Willoughby, 73 S. Ct. 534) held that a physician inducted into the armed forces under the doctor-draft provisions of the law but denied a commission because he refused to answer certain loyalty questions was entitled to be assigned duties falling within medical and allied specialist categories. The duties of a medical laboratory technician fell into such category. The New York Supreme Court, appellate division, (Kelly v. Gregory, 125 N. Y. S. [2] 696) agreed with the decision of the Supreme Court of Illinois referred to above and held that if a child born after an injury sustained at any period of his prenatal life can prove the effect on him of the tort, he makes out a right to recover.

When a drastic injury occurs to an otherwise healthy portion of the body as a result of chiropractic manipulations, a jury may conclude that the manipulator acted negligently, said the Springfield, Mo., court of appeals (York v. Daniels, 259 S. W. [2] 109). In this case the deceased, after chiropractic manipulation, suffered an injury to the spinal meninges resulting in intraspinal bleeding and compression of the spinal cord. The Supreme Court of Washington (Nelson v. Murphy, 258 P. [2] 472) held that a doctor is deemed negligent only if he departs from the normal standards of practice of his community and that the standards of the community, and the question of whether or not the defendant departed from them, can be established only by expert medical testimony. The court of civil appeals of Texas (Daniels v. Finney, 262 S. W. [2] 431) held that the proof of negligence to sustain an action for malicious persecution is the same as in a malpractice action and that if there is no wrong diagnosis there is no lack of probable cause. The Supreme Court of North Carolina (Nance v. Hitch, 76 S. E. [2] 461) stated that the doctrine of res ipsa loquitur does not apply merely because the machine used is under the exclusive control of the defendant. It is applied only where the injury involved would normally not result from what took place unless the person in control of the situation acted negligently. An operating surgeon, said the Supreme Court of Colorado (Maerchlein v. Smith, 266 P. [2] 1095), is entitled to rely on the statement of the referring physician that he has obtained the patient's consent to the performance of the operation. The Supreme Court of Oklahoma (Woodson v. Huey, 261 P. [2] 199) held that a surgeon is not liable for a battery committed by an anesthesiologist who administers a spinal anesthetic without the patient's consent and knowing that patient does not want such a type of anesthetic used upon her. The Supreme Court of Washington (Woods v. Pommerening, 271 P. [2] 705) said that for a physician not to make a full disclosure of all the dangers involved in a particular treatment is not malpractice in and of itself. The Court of Appeals of Maryland (Aitchison v. State, 105 A. [2] 495) concluded that the practice of naturopathy is within the broad definition of the practice of medicine and that a naturopath is therefore not permitted to engage in the healing art without a license from the board of medical examiners.

The Supreme Court of the United States (Barsky v. Board of Regents of University of State of New York, 74 S. Ct. 650) upheld the revocation of a physician's license upon a showing that he had been convicted for failing to produce certain records before a hearing of the House Committee on Un-American Activities. The court said that this was conviction of a crime. In a will contest, the Court of Appeals of New York (In re Coddington's Will, 120 N. E. [2] 777) held that objection had been properly sustained to questions asked of a physician concerning the mental and physical condition of the deceased while she had been under the physician's care. Such information was acquired by the physician as a result of confidence imposed in him by the deceased and was privileged.

Conclusion

The Law Department wishes to express its appreciation for the cooperation and assistance that it has received from the Board of Trustees, the House of Delegates, the various councils and committees, and the officers of the Association, as well as from state and county medical societies and from allied professional organizations and agencies with which it has worked during the period covered by this report.

Report of Committee on Medicolegal Problems

This report of the Committee on Medicolegal Problems covers the period from July 1, 1955, to June 30, 1956. During that time the Committee held one meeting, at which reports were received from the following subcommittees: Professional Liability, Courses in Medical Jurisprudence, Chemical Tests for Intoxication, Medicolegal Aspects of Blood Transfusions, Blood Grouping Tests, Forensic Pathology, and Forensic Psychiatry.

There have been a number of changes in the composition of the Committee during the past year due to the death of one of its original members, Dr. Louis J. Regan, and expert on medical jurisprudence and medical professional liability, and through the resignation of Dr. Francis J. Gerty of Chicago. Dr. Joseph F. Sadusk Jr. of Oakland, Calif., and Dr. Henry A. Davidson of Cedar Grove, N. J., were appointed by the Board of Trustees to fill the vacancies. Mr. C. Joseph Stetler, Director of the Law Department was appointed as a new member of the Committee by the Board of Trustees.

Regional Medicolegal Conferences

In cooperation with the Law Department, the Committee assisted actively in the conduct of three regional medicolegal conferences that were sponsored in October, 1955. These meetings are discussed in detail in the annual report of the Law Department. Drs. Alan R. Moritz, Richard Ford, and Louis J. Regan appeared as feature speakers at all three meetings and participated in the open forum and discussion at the end of each session.

Medical Professional Liability

The Committee has also worked jointly with the Council on Medical Service and the Law Department in conducting a thorough and complete survey of medical professional liability. The Committee is particularly interested in determining legal trends in this field and in the formulation of a sound and workable claims prevention program that will be accepted and implemented by the medical profession. The results of the study obtained to date indicate that this goal should be realized during the coming year.

Manual on Chemical Tests for Intoxication

A final outline has been prepared for a manual explaining and interpreting chemical tests to determine intoxication. It is contemplated that the manual will be completed and distributed in the near future.

Medicolegal Application of Blood Grouping Tests

In 1937 the first report of the American Medical Association Committee on Blood Grouping Tests was prepared and published. At that time only the four A-B-O groups and the three M-N types were in use. In 1952 a second report was published by the Association's Committee on Medicolegal Problems to cover the advances in the preceding 15-year interval, especially the Rh-Hr types. The developments that have occurred during the past four years have been reviewed by a subcommittee under the chairmanship of Dr. A. S. Wiener, and a tentative report outlining the Committee's findings and recommendations was published in the May 19, 1956, issue of The Journal.

The new report includes a discussion of the nomenclature of the Rh-Hr types, a description of certain recently discovered blood factors and blood groups and their medicolegal applications, the use of blood tests as substantial evidence of paternity, as well as the exclusion of parentage, and also a model blood test law. Of these topics the nomenclature is most important and difficult.

Because of the controversy that exists with respect to terminology it was the unanimous opinion of committee that it was best to present its findings, at this time, in the form of a tentative report. Other workers in the field have been invited to submit their comments to the full Committee that will decide, at its next meeting, whether a final report should be published, and, if so, the form it should take

Medicolegal Film Project

The Committee has continued to work in cooperation with the Law Department and with representatives of outside groups in the sponsorship of a series of medicolegal films. The Committee will participate actively in the preparation of the series of six films that is currently being planned Particular assistance will be given in connection with any films dealing with forensic pathology and forensic psychiatry.

Coroner–Medical Examiner System

In cooperation with the Law Department the Committee on Medicolegal Problems has worked actively in support of the Model Post-Mortem Examinations Act as approved by the National Conference of Commissioners on Uniform State Laws. Speakers have been provided on several occasions to explain and discuss the provisions of the model law and the advantages of the medical examiner over the coroner system

Medicolegal Aspects of Blood Transfusions

A special subcommittee under the chairmanship of Dr. Alexander S. Wiener was appointed to prepare a supplementary report on the Medicolegal Aspects of Blood Transfusions The first meeting of this committee has been held in Washington, D. C., and a tentative outline has been prepared for the supplementary report.

Causal Relationship Between Trauma and Disease

Dr. Alan R. Moritz, Chairman of the Committee, has begun the preparation of a Handbook on Medical Criteria for Establishing the Causal Relationship Between Trauma and Disease. It was the belief of the Committee that some guidelines are necessary in this area in order to assist physicians appearing in court as expert medical witnesses It is Dr Moritz's plan to appoint a subcommittee to assist him in his work.

Distribution of Pamphlets

During the year the Committee continued the distribution of several leaflets and pamphlets previously prepared by various subcommittees. During this period 10,100 copies of a leaflet entitled "Test Your A-Q (Alcohol Quotient)–Twenty Questions on Alcohol" were distributed. The Committee also continued its cooperative arrangement with the medical schools and distributed approximately 3,500 copies of the pamphlet entitled "Malpractice and the Physician" to graduating medical students. In addition 900 copies of this pamphlet were distributed to individual physicians on request Five hundred fifty requests were filled for the pamphlets "Medicolegal Aspects of Blood Transfusions" and "Medicolegal Application of Blood Grouping Tests."

Exhibits on Professional Liability and Intoxication Tests

The Committee assisted in the presentation and explanation of the exhibits on Chemical Tests for Intoxication and Medical Professional Liability. These exhibits were shown on 24 occasions.

Conclusion

The chairman, members, and staff of the Committee would like to express their appreciation to the Board of Trustees, officers, and members of the House of Delegates for the cooperation and consideration that has been received in carrying out the assignments of the Committee.

Report of the Committee on Legislation

This report covers the period from Oct. 1, 1955, through Aug. 31, 1956. It is necessary to include the months of July and August in order to portray accurately the activities of the Committee in relation to the Second Session, 84th Congress, which did not adjourn until July 27, 1956. As usual, final action on a large number of important measures was taken in the closing three weeks of the session. The President did not complete his action on acts transmitted to him until Aug. 14, 1956.

During the period covered by this report, the Committee has met three times, on Nov. 28, 1955, in Boston, on Feb. 4, 1956, in Washington, D. C., and on March 16, 1956, in Chicago. All pending legislation with medical implications was considered, Association policies and activities were reviewed, and appropriate recommendations were submitted to the Board of Trustees.

During this period, there have been several changes in the composition of the Committee. On Nov. 28, 1955, Dr. Joseph D. McCarthy, Omaha, resigned as Vice-Chairman because of the increasing pressure of his other duties. The Board of Trustees elected Dr. Frank C. Coleman, Des Moines, Iowa, to fill Dr. McCarthy's unexpired term, and reelected Dr. J. Lafe Ludwig, Los Angeles, and Dr. Reuben B. Chrisman Jr., Coral Gables, Fla., to five-year terms to succeed themselves. At its meeting on March 16, 1956, the Committee elected Dr. McKinnie L. Phelps, Denver, Vice-Chairman. On June 14, 1956, Dr. David B. Allman, Atlantic City, N. J., having been elected President-Elect of the Association, resigned as Chairman of the Committee. The Board of Trustees elected Dr. James R. Reuling as Chairman of the Committee to fill Dr. Allman's unexpired term. The Board also elected Dr. James R. McVay, Kansas City, Mo., as an additional member of the Committee.

SECOND SESSION, 84TH CONGRESS

Although fewer new measures were introduced in 1956 than in 1955, action was taken on many pending bills which had been dormant since the first session. The table below is indicative of the continuing increase in congressional activity, particularly in areas concerning medicine and public health:

	83rd Congress (1953-1954)	*84th Congress (1955-1956)*	*Percentage Increase*
Total measures introduced	16,372	19,039	16
Concerning medicine	407	571	40
Total public laws enacted	781	1,028	31
Concerning medicine	20	26	30

SOCIAL SECURITY AMENDMENTS

H. R. 7225.—This measure amending the Social Security Act in four important respects was introduced on July 11, 1955, and without benefit of public hearings passed the House by a roll-call vote of 372 to 31 on July 18, 1955. The measure provided for the compulsory inclusion in Social Security of virtually all self-employed persons except doctors of medicine. It reduced the retirement age for women from 65 to 62. Of the greatest significance to medicine was the provision for payment of cash disability benefits at the age of 50 to any covered individual found totally and permanently disabled. Finally, to finance the new benefits, taxes were increased by 25%.

At the adjournment of the first session, the measure was pending before the Senate Committee on Finance. Sen. Harry F. Byrd, chairman of that committee, had already received testimony from retiring Secretary of the Department of Health, Education, and Welfare, Oveta Culp Hobby. Mrs. Hobby cautioned against the extensive changes proposed and urged a careful investigation before the enactment of such far-reaching legislation.

During the fall of 1955, the secretary and members of the Committee on Legislation, the Director of the Law Department, and the Director of the Washington Office held an important series of meetings with the leaders of state medical associations. At these meetings, the ramifications of the measure were thoroughly discussed, and arrangements were made for state and local support of the position and activities of the Association in opposition to the medical features of the bill. In addition, the secretary and members of the Committee were active in discussing the proposed disability benefits before state and local medical meetings throughout the country.

With the adoption by the House of Delegates at the Boston meeting of a strong resolution opposing enactment of the proposed disability benefits and advocating a thorough study of the entire Social Security system, the position of the Association was firmly established. Dr. Elmer Hess, President of the Association, on Dec. 5, 1955, addressed a personal letter to every member of the Association, pointing out the contents, history, and status of the bill. He then requested the assistance of all physicians in the campaign against the proposal. The response from the profession indicated overwhelming agreement with the position of the Association, and many replies were extremely valuable in formulating a program of legislative action.

There was cause for concern at that time that the President would endorse the principle provisions of the bill in his State of the Union message in belief that there was great demand for the revisions and little effective opposition to their enactment. The Committee brought this situation to the attention of state and local leaders both within and without the medical profession. The result was a considerable volume of mail to the White House indicating firm opposition to the proposed changes and discrediting the carefully nurtured fable of public demand. The State of the Union message did not endorse the disability features of the bill.

On Jan. 23, 1956, Dr. Hess again wrote an individual letter to each of the several thousand physicians who had responded to his first communication. He asked that their views on the pending measure be transmitted to their own senators and to Senator Byrd, with a request that they be made a part of the record of the hearings then in progress. Again, the response of the profession was excellent. A large part of the record of the printed hearings consists of communications from physicians in all parts of the country registering and explaining their personal opposition to the measure.

On Feb. 9, 1956, 12 physicians, representing national professional organizations and state medical societies, testified before the Senate Finance Committee. All opposed cash disability payments for a variety of reasons. Principally, the testimony demonstrated that the disabled patient would be the eventual loser if the proposal became law. On Feb. 22 and 23, 16 additional witnesses, all, except one, practicing physicians, testified in opposition to the disability section of the measure. Included in this group of medical witnesses were Dr. F. J. L. Blasingame of the Board of Trustees and Dr. David B. Allman, then Chairman of the Committee on Legislation, who presented the views of the Association. Drs. Blasingame and Allman strongly urged against hasty legislative action and warned the committee that, in the face of unknown costs and human effects, it might prove harmful to the public to scrap the proved systems for meeting the needs of the disabled in favor of a new experiment in social insurance. The witnesses pointed out the inevitable growth of the proposal into a system of national compulsory health insurance with its staggering cost and certain deterioration in the quality of medical care.

On March 22, 1956, Hon. Marion B. Folsom, the new Secretary of Health, Education, and Welfare, testified in opposition to the enactment of the disability provisions and supported the testimony previously offered by medical witnesses. Late in May, 1956, after the conclusion of several months of hearings, the Senate Finance Committee voted unofficially, 11 to 3, to delete the disability provisions from the bill. Subsequently, Sen. Paul Douglas of Illinois was appointed to the committee to succeed Senator Barkley and, although he had attended no hearings, signed the minority report.

On May 25, 1956, the action of the committee being then publicly known, Dr. Hess addressed a personal letter to each member of the Senate, warning that a determined effort by the minority to restore the disability benefit section to the measure was planned. Each senator was urged to support the position of the Republican administration and the Democratic majority of the Senate Finance Committee.

On June 6, 1956, the Senate Finance Committee favorably reported the bill to the Senate, amended to delete the new disability benefits, the reduced retirement age for women (except in the case of widows), and the tax increase to finance these proposals. Supporters of the original version worked quietly and effectively behind the scenes to rally Senate support for the controversial proposals. Senator George became the principle sponsor of a compromise amendment designed to accomplish this end. The George amendment provided for voluntary retirement of women at age 62 with an approximate actuarial reduction in their retirement benefits. It also restored the original disability provisions, but established a separate fund under the Social Security Act in order to meet the argument that the unknown cost of the benefits would imperil the Old Age and Survivors Insurance Trust Fund. Finally, it provided for a tax increase one-half the size originally proposed to finance the benefits.

The measure was called up during the week of July 9, 1956, but debate on several other controversial measures was interspersed in its consideration. On the afternoon of July 17, the George amendment was debated under a unanimous consent agreement which limited debate to three hours. It was then adopted by a roll-call vote of 47 to 45. This vote departed only slightly from party lines with seven Democrats voting against the amendment and six Republicans deserting the administration to vote for it. Following this crucial vote, the amended bill passed the Senate unanimously. Late that night, the House and Senate conferees adopted substantially the Senate version of the disability section, and the conference report was agreed to by both Houses on the last day of the session.

Because of the importance of the measure, an effort was made by the opponents of the disability provision to persuade the President to withhold his approval. This effort was unsuccessful, and on Aug. 1, 1956, the measure became Public Law 880.

OTHER LEGISLATION

There follows a review of other measures on which either oral or written statements were presented to the committees or members of Congress, together with the names of the witnesses, a brief resumé of each proposal, a note as to its status at the end of the Second Session of the 84th Congress, and an indication of the nature of the testimony submitted by the Association.

S. Res. 67.—Early in 1955 the Senate adopted this resolution, authorizing a subcommittee of the Judiciary Committee to conduct an investigation of the narcotics problem in the United States. Sen. Price Daniel of Texas, chairman of the subcommittee, conducted extensive hearings on the subject. On Sept. 20, 1955, Drs. Leo H. Bartemeier and Richard J. Plunkett, chairman and secretary, respectively, of the Association's Council on Mental Health, testified before the Daniel subcommittee in New York City. Dr. Plunkett informed the subcommittee of the history of the Association's interest in the narcotic problem, outlining a six-point policy established by the House of Delegates in June, 1924. This policy includes opposition to ambulatory treatment of narcotic addicts, strict enforcement of state and federal narcotic laws, and a recommendation for follow-up and supervision of addicts discharged from hospitals. The subcommittee was also advised of the review of Association policy being currently conducted by the Council on Mental Health and the Council on Pharmacy and Chemistry and of the cooperation of the Association with the American Bar Association in investigating this problem. Dr. Bartemeier discussed the medical aspects of narcotic addiction. He informed the committee that modern psychiatric opinion did not consider addiction as a disease in itself, but rather a symptom or behavior pattern masking much deeper, underlying emotional disturbances and conflicts.

S. 3760.—On April 30, 1956, after the hearings described above had been completed, all members of the Daniel committee joined in introducing this bill, designed to provide greater control of narcotic drugs. Its principle features included outlawing heroin completely in the United States, prescribing mandatory sentences ranging from 5-years' imprisonment to death for specific smuggling violations, establishing mandatory 10-years' imprisonment (or death sentence on jury recommendation) for selling or giving narcotics to a juvenile, and establishing in the Bureau of Narcotics a central records unit on all addicts and violators. After brief hearings, the measure was favorably reported by the Judiciary Committee and passed the Senate with minor amendments on May 31, 1956. In the House the measure was tabled, and H. R. 11619 was passed instead.

H. R. 11619.—During the same period as the investigation of the narcotic problems by the Senate Committee, a subcommittee of the House Ways and Means Committee under the chairmanship of Rep. Hale Boggs of Louisiana conducted similar hearings on the problem. This committee, however, devoted considerable attention to the illicit distribution and evil results of the improper use of barbiturates and amphetamines.

Dr. George F. Lull, Secretary of the Association, wrote to Mr. Boggs on Oct. 14, 1955, explaining the lack of official position with respect to these drugs, advising of current studies, and offering to present for the committee's information one or more witnesses with exceptional knowledge of the medical problems involved in the use and abuse of narcotics, barbiturates, and amphetamines. As a consequence, Dr. Bartemeier appeared before the Boggs committee in October, 1955, accompanied by Dr. Maurice H. Seevers, a member of the Council on Pharmacy and Chemistry. These witnesses presented no prepared statements, but discussed with the members of the committee the medical problems involved and answered technical and medical questions on the subject propounded by the committee.

This bill was introduced on June 6, 1956. It established severe mandatory sentences for narcotics violators but prescribed no death penalty. Its other major controversial provision involves wire tapping by narcotics agents but in its final form was watered down to do no more than prescribe penalties against persons using communication facilities in the illegal sale or distribution of narcotic drugs. This measure passed the House on June 20, 1956, and was sent to the Senate where, on June 22, 1956, its entire text was stricken and the text of S. 3760 was substituted. As thus amended, the bill passed the Senate and went to conference. The conferees adopted the Senate version, including the death penalty for peddlers of heroin to minors and the prohibition of the use of communication facilities in the illegal distribution of narcotics. The conference report was adopted by both Houses and the measure, approved by the President on July 18, 1956, became Public Law 728.

H. R. 9 and H. R. 10.—The legislative activities of the Association in support of these measures sponsored by the American Bar Association continued. During 1955 Association witnesses testified before the House Committee on Ways and Means, urging the enactment of equitable tax deferment privilege for the self-employed who desire to set aside a reasonable portion of their current income for the creation of voluntary retirement funds. On Jan. 9, 1956, in cooperation with the presidents of other organizations of self-employed and professional men, Dr. Elmer Hess addressed an individual letter to each member of the House of Representatives and to each senator calling attention to the existing discrimination against the self-employed and soliciting the support of each individual member of Congress in enacting legislation to correct this inequity in 1956. Responses received by Dr. Hess were encouraging. A tabulation of these responses, as well as those received by other cooperating organizations, indicated that nearly 30% of the membership of both Houses of Congress would support such a proposal if it cleared the House Ways and Means Committee. The measure was never reported from committee, but activities in the closing days of the session indicate that some action in this area is virtually certain in the next Congress.

Because of the continuing pressures on the Ways and Means Committee for various types of tax relief, both for the self-employed and for the employed who are now beginning to complain about their heavy social insurance tax burden, it can be expected that 1957 will bring a decision in this area.

H. R. 483.—This measure, authorizing the appointment of osteopaths as medical officers in the armed services, passed the House on July 18, 1955. In the last annual report the letter from Dr. Lull to Sen. Richard B. Russell, Chairman of the Senate Armed Services Committee, opposing this measure was reported. As a result of this letter and the opposition to the measure by the three surgeons general, a subcommittee of the Senate Armed Services Committee under the chairmanship of Sen. Stuart Symington of Missouri conducted hearings on the measure. Dr. James R. McVay of the Board of Trustees, accompanied by Dr. Edward L. Turner, Secretary of the Council on Medical Education and Hospitals, testified before this subcommittee on Feb. 14, 1956. Dr. McVay expressed the opposition of the Association to the invasion of the military medical services by osteopaths, provided by the bill. The committee was advised that persons licensed to practice only osteopathy, as well as those licensed to practice medicine or surgery, could be commissioned under the measure. A comparison between the education and clinical experience of graduates of accredited schools of medicine and schools of osteopathy was made. The relationship of the bill to current attempts to build a career medical service was also discussed. The extension of both the regular draft and the special doctor draft, it was pointed out, would have the effect of making the measure mandatory rather than permissive, as is the case with similar legislation under which the Veterans Administration and the United States Public Health Service operate. Dr. Turner discussed with the committee the standards of approved medical schools and approved internship and residency training programs, emphasizing the comparison between these programs of medical education and the past and present standards of osteopathic education.

Despite strong representations by the Association and the surgeons general of the Army, Navy, and Air Force, the subcommittee favorably reported the measure to the full committee. On March 15, 1956, Dr. Lull again wrote Senator Russell relating the Association's opposition to H. R. 483. On April 11, 1956, Dr. Dwight H. Murray, Dr. Harold C. Lueth, and Mr. Frank W. Barton, in testifying before Senator Russell's committee in connection with H. R. 9428, stressed the reasons for the opposition to H. R. 483. Supplementing Dr. Murray's testimony, detailed statements were submitted dealing with the state licensure laws and previous actions by the House of Delegates concerning osteopaths.

On April 26, 1956, the Senate Armed Services Committee, having amended the measure to permit the appointment of any individual osteopath only upon the recommendation of the surgeon general of the appropriate service, favorably reported it to the Senate. The bill passed the Senate, as amended, on May 21, 1956. Since the Senate version differed from the House bill, a conference was requested and the conferees adopted the Senate restriction substituting the decision of the secretary of the appropriate service. Both Houses agreed to the conference report and, with the President's approval, on July 24, 1956, the measure became Public Law 763.

S. 890.—This bill, to extend the Water Pollution Control Act of 1948 and modify the mechanism and federal cooperation in this field, passed the Senate and was favorably reported by the House Committee on Public Works during the First Session. Association witnesses had testified favorably on the measure prior to such action. On Jan. 23, 1956, the measure was recommitted to the committee by unanimous consent. Hearings were then held on another bill, H. R. 9540, referred to below. After the committee favorably reported the substitute bill, the House declined to act on it and instead discharged the committee and passed S. 890 with an amendment providing for federal grants-in-aid to state or local governments for the construction of treatment works for sewage and other waste. The measure then went to conference; the conferees approved the House version and with the President's signature on July 9, 1956, the bill became Public Law 660.

H. R. 9540.—The measure was introduced as a substitute for S. 890. It differed principally from that bill in its authorization of up to one billion dollars for federal matching grants to state or local governments for the construction of treatment works for sewage or other waste. On March 22, 1956, Dr. Lull, by letter, reiterated the Association's endorsement of S. 890 and the features of H. R. 9540 which represented improvements in the existing law. The Association, however, disapproved of the new construction grant provision as inconsistent with the underlying philosophy of the act, recognizing the primary responsibility of local and state governments in the control and abatement of pollution. The Association recommended instead an extension and, if necessary, an improvement of the unused loan provisions of the existing act.

The bill was reported from the Public Works Committee on May 21, 1956, containing the grant provisions to which the Association objected. It was subsequently tabled in the House and S. 890 enacted in its place.

H. R. 2108.—This measure would have provided for the repeal of certain laws relating to professional examinations for the promotion of medical, dental, and veterinary officers of the Army and Air Force. No provision for the repeal of similar examinations for medical and dental officers of the Navy was made, inasmuch as professional examinations are required for the promotion of all Navy officers. On Jan. 23, 1956, Dr. Lull wrote to the House Armed Services Committee stating that the Association was in full accord with the purposes and provisions of H. R. 2108. The measure was favorably reported by the committee on Feb. 8, 1956, and passed the House on Feb. 20, 1956. It was pending in the Senate when the 84th Congress adjourned.

S. 2587.—This measure was requested by the Public Health Service to accomplish a number of changes designed to facilitate personnel administration in the commissioned corps. In addition to providing substantial benefits to the officers of the commissioned corps, the bill authorized the President to make that corps a military branch in time of emergency involving the national defense. Under existing law, such status was permissable in time of war but not in time of emergency. The Public Health Service considered this change in the law necessary to discharge adequately its new civil defense responsibilities.

The measure was favorably reported by the Committee on Labor and Public Welfare, without hearings, on July 29, 1955, and passed the Senate the next day. The concern of the Association lest military status be the vehicle through which physicians were drafted to staff the Public Health Service was expressed to Chairman J. Percy Priest of the House Committee on Interstate and Foreign Commerce. As a result, no action was taken on the measure until 1956. In the meantime, adequate assurances were received from the surgeon general of the Public Health Service that military status in time of national emergency would not be used for the purpose of placing calls for civilian physicians with the Selective Service System. Dr. Lull then wrote Chairman Priest on Feb. 8, 1956, indicating the Association's support for the measure.

The bill was favorably reported by the committee on April 9, passed the House on April 16, and upon approval by the President on April 27, 1956, became Public Law 492.

S. 3076.—This measure, introduced at the request of the Department of Health, Education, and Welfare, provides for a continuing survey and special studies of sickness and disability in the United States and for periodic reports of data obtained. The last such survey was conducted in 1935 and 1936 and is concededly of little value now.

On Feb. 23, 1956, Dr. Lull wrote to Senator Hill, Chairman of the Senate Committee on Labor and Public Welfare, suggesting as an alternative to the pending measure, the desirability of one or more periodic surveys in accordance with the recommendations in the President's health message. The measure was favorably reported and passed the Senate on March 29, 1956. On April 17, 1956, Dr. Lull wrote Chairman Priest of the House Committee on Interstate and Foreign Commerce supporting the enactment of S. 3076 on the basis of assurance from the Department of Health, Education, and Welfare that periodic checks of specific aspects of illness and disability would be made to supplement the basic data obtained. The measure was reported by the committee on May 3, 1956, passed the House under a suspension of the rules on June 18, 1956, and upon approval of the President on July 3, 1956, became Public Law 652.

H. R. 4446.—This measure was one of nearly a dozen similar bills intended to provide assistance to the states in the construction, renovation, and improvement of domiciliary buildings of state and territorial soldiers' homes by federal grants to subsidize part of the capital outlay. Under a federal law enacted in 1888, federal contributions to states to aid in the care of certain war veterans domiciled in state homes have been paid on a per capita basis. Veterans in such homes are generally indigents whose illness or disability are known to be more than 90% non-service-connected.

When hearings were held on the measures, Dr. Thomas H. Alphin, Director of the Washington Office, wrote Chairman Olin E. Teague of the House Committee on Veterans Affairs expressing the opposition of the Association to the measures. Dr. Alphin stated that the Association viewed the problem of resident veterans in state soldiers' homes as a part of the total medical care program for indigent citizens, veteran and non-veteran alike, the responsibility for which rests with communities and states.

The measures remained pending in the House Committee on Veterans Affairs when Congress adjourned.

H. R. 6376.—This measure was designed to assist the territory of Alaska in the establishment of a modern and effective program for the care of its mentally ill residents. The measure was reported by the House Committee on Interior and Insular Affairs on July 25, 1955, and at the close of the first session was pending before the House. On Jan. 18, 1956, the measure passed the House and was referred to the Senate Committee on Interior and Insular Affairs. Largely because of a misunderstanding of the commitment procedures of the measure, it became highly controversial.

The measure was carefully considered by the Committee on Legislation and the Executive Committee of the Board of Trustees, and on March 20, 1956, Dr. Lull wrote Senator Murray recommending the enactment of the measure, with three reservations. In this letter it was pointed out that the establishment of any commitment procedure involves a very difficult medicolegal problem, presenting a conflict between the desirability of instituting a course of therapy as early as possible and with a minimum of disturbance to the patient and the legal necessity of preserving the civil rights of the person sought to be committed. This being the most controversial section of the measure, the Association, from a medical point of view, endorsed the commitment procedure proposed but recommended that the Committee obtain recommendations from the American Bar Association with respect to the legal protection afforded by the procedure. The Association also recommended clarification of the language authorizing reciprocity between Alaska and the states in the commitment and treatment of their respective residents found to be mentally ill in other jurisdictions. Finally, the Association recommended that certain criminal penalties for fraudulent abuse of the commitment procedures, which had been present in an earlier draft, be reinstated.

On May 25, 1956, after eliminating the commitment procedure in its entirety, the Senate committee reported the measure. Since Congress was acting as the territorial legislature in establishing the procedure originally, leaving to that legislature full freedom to alter, amend, or repeal these provisions, the effect of this elimination was merely to permit the territorial legislature to enact its own procedure. The measure passed the Senate on June 7, 1956, and after a conference in which the conferees agreed to the Senate version, the measure was adopted by both Houses. The President approved the law on July 28, 1956, and it is now Public Law 830.

H. R. 7994.—This measure was introduced by Chairman Vinson of the House Committee on Armed Services on Jan. 3, 1956, to provide medical care for the dependents of members of the armed forces of the United States.

On Jan. 25, 1956, Dr. Edwin S. Hamilton, Secretary of the Board of Trustees, Dr. Woodruff L. Crawford, Chairman of the Committee on Maternal and Child Care of the Council on Medical Services, and Mr. C. Joseph Stetler, Director of the Law Department, testified on the measure before a subcommittee of the House Committee on Armed Services under the chairmanship of Rep. Paul J. Kilday of Texas. These witnesses advised the committee that the Association had adopted no position on the question of the responsibility of the government to provide medical care for military dependents. They urged strongly, however, that if Congress elected to provide such care, increased emphasis be placed on the utilization of civilian facilities and the services of civilian physicians. Several possible systems for the financing of medical care of dependents by civilian agencies were discussed, without committing the Association to the support of any of these systems.

At the conclusion of hearings, a clean bill, H. R. 9429, adopting many of the Association's recommendations was introduced by Representative Kilday.

H. R. 9429.—This measure, a substitute for H. R. 7994, incorporated many major changes found desirable as a result of hearings on the previous bill. One section, however, was controversial.

Dependents entitled to medical care under the bill were permitted freedom of choice between military and civilian facilities except that the Secretary of Defense was authorized to limit this right in the case of dependents residing with their military sponsor where the serviceman concerned was assigned to an installation with adequate military facilities for the care of such dependents. This provision was inserted at the insistence of the surgeons general of the armed forces, who feared that an exodus of dependents from military facilities might otherwise occur. It was opposed by the Association in the belief that it would deprive dependents of a free choice of physician and that it might lead to the construction of additional medic
and the procurement of additional military physi
the purpose of providing dependent care.

On Feb. 17, 1956, Dr. Lull wrote each
Armed Services Committee expressing the A
tion to the proposed section, together with the
Hearings were held by the full committee, at
views of the Association were considered and
measure was then favorably reported by the Arm
Committee on Feb. 22, 1956, and passed the House on
1956.

On March 15, Dr. Lull wrote Senator Russell, Chairm
the Senate Armed Services Committee, expressing opposition
the lack of free choice of physician.

Hearings on the measure were held on April 13, 1956, by the Senate Armed Services Committee. Dr. David B. Allman, then Chairman of the Committee on Legislation, accompanied by Dr. Crawford and Mr. Frank W. Barton, Secretary of the Council on National Defense, presented testimony for the Association. Their statements were essentially the same as those presented by Association witnesses before the House Armed Services Committee earlier, but considerable emphasis was placed on the concern that this measure, particularly in view of the authority vested in the Secretary of Defense to restrict civilian care, might result in a program of increased military construction and staffing solely to provide dependent care. On May 3, 1956, after the Senate Armed Services Committee had amended and favorably reported the measure, Dr. Lull again wrote Senator Russell. In this letter he pointed out that the changes made by the committee tended to again weight the measure toward greater utilization of military facilities. Specifically he recommended against the severe limitation of civilian medical care written into the bill, a change in the cost to dependents of civilian hospitalization for short-term illnesses, and the addition of a large number of reservists and their dependents as potential beneficiaries.

The measure passed the Senate, with these amendments, on May 14, 1956. Since this version of the bill differed materially from that which passed the House, a conference was held. The conferees adopted most of the House provisions. Both houses then adopted the conference report, and the measure was signed by the President on June 7, 1956, becoming Public Law 569.

H. R. 8500.—During the testimony of Association witnesses in opposition to the extension of the Doctor Draft Act in June, 1955, a strong recommendation was made that the Department of Defense and Congress take steps to make career military medicine more attractive, thereby eliminating the need for such a large number of physicians to serve under compulsion. During the fall of 1955, a military task force of the Department of Defense conducted an extensive survey to determine what measures could be taken to achieve this end. This group recommended increases in longevity pay, a more favorable promotion policy, and a substantial increase in special pay based on contracts obligating a physician to serve for three, six, or nine years. Representatives of the Association were afforded an opportunity to examine the recommendations of this task force before the introduction of enabling legislation. With the exception of the contract service proposals, the Association agreed to support the recommendations.

On Jan. 16, 1956, Chairman Vinson of the House Committee on Armed Services introduced a watered-down Career Incentive Bill. A subcommittee of the Armed Services Committee held extensive hearings on the measure. Dr. Edwin S. Hamilton of the Board of Trustees, accompanied by Dr. Harold C. Lueth, a member of the Council on National Defense, and Mr. Frank W. Barton, Secretary of that Council, testified on Feb. 16, 1956. These witnesses endorsed the measure but urged adoption of the original recommendations for substantial increases in special pay.

As a result of these hearings, Representative Kilday, on Feb. 20, 1956, introduced a greatly improved clean bill.

H. R. 9428.—This measure, designed to increase the career attractiveness of military medicine, was a substantial improvement over H. R. 8500. The principle new feature was authorization for increases in special pay in increments of $50 after three, six, and nine years of service. The measure was favorably reported by the full Committee on Feb. 22, 1956, and passed the House on March 2, 1956.

Hearings were held on the measure in the Senate on April 11, 1956, with Dr. Dwight H. Murray, President-Elect of the Association, accompanied by Dr. Lueth and Mr. Barton, appearing. The Association again strongly supported the measure but recommended further improvements, including a change from three years to two years in the initial increased special pay and an increase in the amount of special pay to more nearly equalize military salaries with the salaries offered physicians of equal training and experience as civilian employees of the government. The first modification suggested was adopted by the Committee, which favorably reported the measure on April 16. It passed the Senate on April 18. The House agreed to the Senate amendments, and it was signed by the President on April 30, 1956, becoming Public Law 497.

S. 3430.—This measure proposed the establishment of a National Library of Medicine to be created from the Armed Forces Medical Library. The bill prescribed neither the government agency to supervise the institution nor its location. Hearings on the measure were held by the Committee on Labor and Public Welfare on April 10, 1956, with nearly a score of witnesses endorsing the construction of the library. Dr. Preston A. McLendon, representing the Association, supported the bill and recommended that the Library be "administratively and geographically attached to the Department of Health, Education and Welfare." On May 29, the measure was reported to the Senate providing for the creation of the library in the U. S. Public Health Service with a 15-member board of regents as its governing body. On the same date, the House Committee on Interstate and Foreign Commerce conducted hearings on a companion bill, H. R. 11524. On July 23, 1956, the House amended the measure to permit the board of regents to select the location for the library, thereby avoiding a regional controversy, and passed the measure. The House version was accepted by the Senate; the measure was signed on Aug. 3, 1956, and became Public Law 941.

H. R. 11524.—This was a companion measure to S. 3430, introduced by Chairman Priest of the House Interstate and Foreign Commerce Committee on May 29. Hearings on this compromise version were held on June 11, and Dr. McLendon again represented the Association, reiterating the testimony which he had delivered on S. 3430. Due to the controversy developed by the introduction of H. R. 11267 and other similar measures, Dr. Lull wrote Chairman Hill of the Senate Labor and Public Welfare Committee, Chairman Priest of the House Interstate and Foreign Commerce Committee, and Chairman Burleson of the House Administration Committee, reiterating the recommendation of the Association that construction of the library be expedited and that the facility be "administratively and geographically attached to the Department of Health, Education and Welfare." After having been approved in Committee, this measure was tabled in favor of S. 3430.

H. R. 11267.—This measure provided for the construction of a National Medical Library and directed that the facility be located in Chicago. Due to a jurisdictional dispute, hearings were conducted on June 19 before the House Administration Committee. The Association submitted no testimony on this measure, but was instrumental in arranging the compromise through which the location of the facility was left to the board of regents. This bill, like H. R. 11524, was then tabled in favor of the enactment of the amended version of S. 3430.

H. R. 11630 and H. R. 11633.—These identical bills would have provided nonoccupational group major medical expense insurance for federal employees and their dependents and authorized voluntary payroll deductions for other group medical expense benefits. The major medical expense protection would have been supplied without additional cost to all employees covered by group life insurance under the Federal Employee Group Life Insurance Act, but the government would have borne no part of the cost of other medical expense contracts providing other basic protection. The measure was highly controversial, with spokesmen opposing the measure in favor of contributory basic coverage. Most spokesmen for federal employee unions supported the proposal as the best program obtained at the time. The Administration opposed payroll deductions because of administrative expense.

In a letter to Chairman Murray, Dr. Lull expressed the support of the Association for the principle of voluntary group hospital, surgical, medical, and other personal health expense benefits for federal civilian employees commenting on the value of such voluntary programs in application of other employee groups. No position on the details of the measure, or on the controversies surrounding it, was taken by the Association. After failure to obtain agreement on any of its provisions, the bill was dropped by the committee and died.

S. 3958.—From the information obtained during hearings on the Omnibus Health Bill (S. 886) in 1955, Sen. Lister Hill, joined by most of the members of the Senate Committee on Labor and Public Welfare, introduced this clean bill on May 29, 1956. The measure embodied traineeships for graduate or specialized training in public health for physicians, engineers, nurses, and other professional public health personnel; traineeships for nurse educators, supervisors, and administrators; earmarked grants to states for vocational training of practical nurses and auxiliary health personnel; grants to states for personnel training and research projects in improving the treatment of the mentally ill; and a two-year extension, until July 1, 1959, of the Hill-Burton Hospital Construction Act. The measure was reported on the same day it was introduced and passed the Senate on June 11, 1956.

An identical bill, H. R. 11549, was tabled in the House Committee on Interstate and Foreign Commerce in favor of this measure, which was reported July 19, 1956, and passed the House on July 23. Upon signature by the President on Aug. 2, 1956, it became Public Law 911.

H. R. 11549.—This measure, a companion bill of S. 3958, was introduced by Chairman J. Percy Priest of the House Committee on Interstate and Foreign Commerce. Hearings were held on this measure at the same time as on H. J. Res. 485. On June 13, 1956, Dr. Lull wrote Representative Priest concerning both bills. Since the position of the Association on other features of the measure had already been made known to both committees during the 1955 hearings, comments were limited to the nursing features.

Reiterating the Association's long-standing recommendation of the value of adequately trained practical nurses and auxiliary hospital personnel to the care of the patient, and emphasizing the growing shortage of adequately trained graduate nurses, Dr. Lull outlined two prerequisites to a solution of the problems. First, he recommended a thorough and impartial evaluation of the nursing situation to the end that all concerned might reach agreement on the steps required to improve that situation and the proper role of the federal government in any improvement program. Second, he emphasized the community aspects of existing nursing problems, and urged that initiative and direction of new training programs for practical nurses and auxiliary hospital personnel come from the communities rather than from Washington. Based on these principles, Dr. Lull's letter supported the establishment of traineeships for nurse educators, administrators, and supervisors, supported the establishment of a commission to investigate nursing services, and opposed the enactment of a new program of earmarked grants for the vocational education of practical nurses.

After these hearings, H. R. 11549 was tabled in favor of S. 3958.

H. J. Res. 485.—This measure proposed the establishment of a Presidential Commission on Nursing Services to investigate and report on the needs for improvements in such services, including new or expanded personnel-training programs. This measure was similar to H. J. Res. 171 introduced by Mrs. Bolton in 1955 to establish a Congressional Commission for this purpose. The Association supported both measures. The only hearings held on this resolution were those conducted before the House Interstate and Foreign Commerce Committee in connection with hearings on H. R. 11549. Dr. Lull's letter of June 13, 1956, to the chairman of that committee supported the measure.

No further action was taken on the resolution, and it remains pending before the House Committee on Interstate and Foreign Commerce.

S. 849.—This measure, to authorize federal matching grants of 30 million dollars annually for three years to nonprofit, accredited schools of medicine, dentistry, and osteopathy, and to hospitals for the construction of nonfederal research and laboratory facilities, passed the Senate in 1955. During hearings before the Senate Committee on Labor and Public Welfare, the Association had opposed the bill because of a conviction that an emergency of sufficient proportions to justify federal subsidy in so broad a field had not been demonstrated.

In preparing its legislative program in 1956, the Department of Health, Education, and Welfare expanded the measure to include the construction of teaching as well as research facilities, thereby combining the objectives of Senator Hill's measure and S. 1323, the Medical School Construction Bill. H. R. 9013 and H. R. 9014, coordinating the two proposals, were introduced on Feb. 1, 1956. On April 12, 1956, as hearings on these measures were conducted, Dr. Lull wrote Chairman Priest, reiterating the opposition of the Association to S. 849 unless it were coordinated with other research and construction measures. In the same letter, Dr. Lull restated the Association's support of S. 1323, the Medical School Construction Bill, and endorsed the coordinated approach to the two problems as exemplified in H. R. 9013 and H. R. 9014. Dr. Lull urged, however, that the measure be amended to eliminate osteopathic facilities from its benefits and to make it clear that optometric institutions would not receive research grants since the diagnosis and treatment of pathological conditions of the eye are beyond the scope of optometric practice.

The measure, without the modifications suggested by the Administration or the change recommended by the Association, was favorably reported on May 21, 1956. The measure remained pending before the Rules Committee until after the House defeated the Federal Aid to Education Bill. It was then cleared for floor action, without amendment, and passed the House on July 13, 1956.

The House version differed from the Senate version because of its broader definition of facilities eligible for the construction grants. A conference was necessary, and the conferees adopted the House bill. Both Houses agreed to the conference report and the measure was signed by the President on July 30, 1956, becoming Public Law 835.

CIVIL DEFENSE APPROPRIATIONS

On June 19, 1956, Association witnesses appeared before the subcommittee on military operations of the House Committee on Government Operations which, under the chairmanship of Rep. Chet Holifield of California, was conducting hearings on civil defense preparedness. Statements were presented by Mr. Frank W. Barton, Secretary of the Council on National Defense, and Dr. Harold C. Lueth, a member of that Council. The witnesses related the interest and activities of the Association in the medical aspects of civil defense over a 10-year period, and stressed the necessity for preparation to meet the medical disasters certain to follow thermonuclear attack. Specifically, Dr. Lueth recommended federal rather than state and local responsibility of planning, training personnel, and conducting medical civil defense operations.

No legislation was introduced to implement any of the recommendations received by the Committee during these hearings.

VETERANS LEGISLATION

On March 23, 1956, the House Committee on Veterans Affairs, under the chairmanship of Rep. Olin E. Teague of Texas, conducted hearings on a number of bills providing that a variety of chronic and disabling conditions be presumed by the Veterans Administration to be service-connected if arising within certain defined periods of military service. Dr. Walter B. Martin, Past President of the Association, accompanied by Dr. Desmond O'Doherty, testified. Both witnesses reiterated the position of the Association in opposition to the establishment of service-connection by legislation rather than in actual review of the facts in each case. The witnesses then discussed for the committee the medical problems involved in determining the causal relationship between a disability or disease and an incident arising in military service. The measures considered during this hearing were not acted upon and remained pending before the House Committee on Veterans Affairs at adjournment.

CONCLUSION

In closing its report, the Committee on Legislation wishes to express its appreciation to the Board of Trustees, the Washington Office, the Woman's Auxiliary, and the officers and staff of the Association, as well as to the state medical societies, for their cooperation and assistance during the period covered by this report. It particularly wishes to acknowledge the significant contribution of "key legislative personnel" and individual physicians.

Report of the Washington Office

The last year has been a significant one in national medical legislation, a year that may have strengthened the long-established trend for more and more government participation in health and medical activities. Perhaps because of fewer foreign affairs crises, the 84th Congress turned more of its attention to domestic issues. While foreign aid and military spending remained in prominence, such domestic questions as school aid, the farm program, and desegregation, as well as health legislation, assumed new legislative importance. In the absence of actual threats of war, many legislators believe there is no reason to expect that Congress will reverse itself in future sessions and take less interest in legislation which has the demonstrated popular appeal that health programs carry.

In the last two years there were few senators or representatives who were not actively interested in at least one medical bill of major importance. A total of 18,939 bills were scanned by the Washington Office for medical implications. Of these, 571—many with a number of sponsors—were followed through their legislative course. During the two years, 25 were enacted. For much of this legislation, the first session was a warm-up—bills discussed, hearings held, texts written, and rewritten—but there was not much action. In 1956 Congress set to work on health legislation in earnest, and in the closing weeks of the session decisions came rapidly as the lawmakers attempted to establish records on which to face their constituents in the fall election.

Here are just a few of the major health bills to be enacted late in the second session: A broader program for medical care of military dependents; new grants for training of health personnel; OASI payments to the disabled at age 50; a national health survey; a bill setting up a new mental health program for Alaska; establishment of a National Library of Medicine, and a 90 million dollar program of grants to construct and equip medical research facilities.

During the year a total of 21 physicians appeared as official witnesses for the American Medical Association. Thirty others testified along the lines of Association policy, although not as the Association's official witnesses. Another 30 or more appeared at the hearings, some of them answering committee questions. On a score of bills, the Association submitted written testimony but was not represented by witnesses.

Strengthening the profession's legislative position, state and local medical society publications consistently carried information on the American Medical Association's legislative objectives, some of it from the Washington Office publications, some from Chicago headquarters, and some prepared by the editors themselves.

Stepped-up medical activity in Congress has resulted in some changes in operations of the Washington Office staff, all designed to keep abreast of the increased workload and the increased opportunities to present the medical viewpoint. A better liaison has been developed with Chicago headquarters and with the Committee on Legislation. At the request of the committee, the Washington Office has been represented at many of its meetings by the director and other personnel who have worked closely on Capitol Hill with the legislation under consideration. Freer and more frequent exchange of information between the Washington Office and the committee's secretariat and others in the Chicago headquarters has developed. This closer coordination has taken an appreciable amount of time, but situations that might have led to confusion or misunderstanding often have been eliminated.

During the two years 42 hearings were held by Senate and House committees on bills of major importance to medicine, the vast majority of them during the second session. The longest hearing was by the Senate Finance Committee on the social security amendments, extending from late January until early May, with interruptions while the committee took up other matters. During the two years, congressional committees conducted more than 250 days of hearing on important health bills (154 this year alone) all of which were covered in person by one or more representatives of the Washington Office.

In addition to covering the day-to-day public hearings, Washington Office personnel kept in close contact with congressional leaders and committee staffs handling the legislation. Through such direct liaison on the technical staff level, the Association's representatives were able to assist in the drafting of workable legislation while at the same time consistently presenting to committees the viewpoints of practicing physicians. This healthy working relationship between the American Medical Association and committees was maintained on all important pieces of legislation, resulting in the improvement of some objectionable legislation and the strengthening of desirable bills.

At the same time the Washington Office participated to a greater extent than at any time in the past in the drafting of regulations and in the interpretation of new laws by federal departments and agencies. In the course of the past year it has become apparent that here is an opportunity that may not have been taken advantage of sufficiently in the past. Once bills are enacted, the original intent of Congress may be modified one way or the other in the process of writing the regulations to implement the law. In most cases agency officials welcome the cooperation of American Medical Association personnel in setting up the guidelines. Efforts exerted in this direction often can minimize the unfortunate effects of some bills and improve the beneficial effects of others. In this area conspicuous work was done with the Small Business Administration on loans to health facilities, with the Department of Health, Education, and Welfare on Salk poliomyelitis vaccine legislation, with the Civil Service Commission on bills for health insurance for U. S. civilian employees, and with the Defense Department on the dependent medical care bill. Currently the Washington Office is assisting Chicago headquarters in doing everything possible to help the Department of Health, Education, and Welfare write the best possible procedures for the new social security amendments.

If the sudden rush of medical legislation was a little startling this year, the reaction from the medical profession was encouraging. Physicians from all parts of the country, realizing that they had a stake in what was happening, came to Washington to testify before congressional committees. Others, by letter, wire, and phone call, advised their senators and representatives on how the medical profession stood on each bill. It is to their credit that so many objectionable bills were stopped and so many others made more workable before their enactment. While the technique for keeping the profession informed politically is not as effective as it might be, and while the average doctor's sense of political responsibility is not what it could be, these factors only add to the credit due those who did respond every time their help was asked.

A new departure this year was the inauguration of the Washington Office Legislative Analysis service, designed to supply exact and detailed information, under a legalistic format, to a relatively small mailing list. The list is made up mostly of American Medical Association officers and officials, members of the Committee on Legislation, state secretaries, and others who have a continuing and critical interest in the details of national legislation. During the year a total of 84 pages of Legislative Analysis of new bills were published.

The weekly A. M. A. Washington Letter continued to report on new bills, without so much detailed information, as well as on all other medical developments in Washington. Also continued were the Special Reports and Quarterly Legislative Reviews, supplemental to the Letter and sent to the same mailing list. During the two years a total of 25 Special Reports were published. In 1955 they covered a variety of subjects. This year a majority of them were devoted to various phases of the Association's fight against the social security amendments. Two Special Reports this year attracted more than the usual attention. One summarized all federal spending for health and medical matters—information available nowhere else, except at the Bureau of the Budget. Although a long report, it was reprinted in a number of journals. The other was an analysis, in easy-to-comprehend language, of the new military dependent medical care bill, published shortly after the bill became a law. This was the first such analysis of the bill to be published, and more than 6,000 reprints were issued at the request of various medical and other groups.

The office continued to mail out a Month in Washington column tailored to the needs of state and regional journals. It is published intact regularly in about half the large medical journals. Many others use the column occasionally, or incorporate parts of it in other articles.

As in the past, the office furnished The Journal of the American Medical Association with a weekly summary of all Washington medical developments, carried in the first part of The Journal under the heading "Washington News." As a special service to Journal readers interested in more complete details on legislation, the office also furnishes a column devoted to the contents and implications of new bills and a summary at the close of the session.

For the second year, the Washington Office also has supplied to the *Journal of the Student American Medical Association* a monthly column emphasizing Washington news of interest to medical students.

Supplying assistance of various types to individuals and groups, including officials of the Association, is a growing responsibility of the Washington Office and demands more and more staff time. Services include the supplying of legislative material and similar information, preparation of speech and special article material, editing and preparation of testimony, and assistance on reports or special projects. The Office uses its own legal, editorial, mechanical, and stenographic personnel and facilities to prepare, reproduce, and mail this material.

The increased tempo of medical legislation and the mounting interest of many state societies in Washington developments naturally have resulted in a significant increase in Washington contacts of all types with doctors in the states. Washington staff people have traveled to state society meetings to discuss legislation, the volume of correspondence has stepped up, and during the critical legislative situations the long distance phone has been used extensively. The Washington Office continues to comply promptly with requests from state societies for information on particular Washington situations, a service that frequently involves a large amount of research time, but which it is felt is needed and which the office is glad to be able to furnish. Other inquires also continue to increase—from congressional offices, from press and radio representatives, and from other organizations in the health fields. Some of these also require extensive research, but all are handled as expeditiously as possible in relation to available manpower.

The Washington Office undertook an experiment in mailing. Early in the spring, most of the mailing list was sent out as third class rather than first class mail. Each of the states subsequently was asked to advise the office of any complaints about delay. Although only three states advised of confusion, it was decided, because of the importance of pending legislation, to return to the used first class mail for the entire list while Congress was in session. When the Congress adjourned, the more economical mailing plan was reinstituted, with first class postage used in certain situations where the delay would be excessive. By following this procedure it is expected that approximately $2,500 a year will be saved in postage.

When the Association discontinued its printing operations in Chicago, a surplus graphotype machine was made available to the Washington Office. As a result of this acquisition, immediate changes or additions to the mailing list of Washington Office publications can be made.

A qualified librarian was hired to make the volume of information flowing into the Washington Office readily available to the staff, but there were no other additions of personnel during the year. The staff continues to consist of a director, an assistant to the director, two assistant directors who are physicians and assigned to the Senate and House, a legal adviser, a political adviser, an editor and an associate editor, two men in the duplicating and mailing operations, and nine secretaries, stenographers and clerical assistants. The duties and responsibilities of all members of the staff have been augmented and continue to increase. Although each staff member continues to serve in the special capacity for which he is peculiarly qualified, all of the executive staff are expected to be able to supplement each other. To this end three more staff members, all of whom are attorneys and experienced in legislative activities, have been registered as lobbyists as provided by law. These are in addition to the three physicians, who continue to register as lobbyists.

Report of Department of Public Relations

The period covered by this report is July 1, 1955, to June 30, 1956. As in the three previous years, the American Medical Association's public relations program again emphasized positive, practical activities designed to improve physician-patient relationships, promote closer relations between the Association and its members, assist state and county medical societies in the establishment and improvement of organized public relations programs, and create a better understanding of medicine's policies and objectives among both the professional and the general public. Particular attention also was devoted to special projects such as Medical Education Week, National Science Fair, Farm-City Week, the "Meet Medicine" luncheon at the annual meeting, the American Medical Association public opinion survey, increased activity in the field of television, and an intra-professional educational program concerning the Social Security issue.

ADVISORY COMMITTEE

The Advisory Committee to the Director of Public Relations met four times during the period of this report. The committee provided valuable advice on specific projects, both current and proposed, and also on broad, long-range public relations problems facing the medical profession. Present members of the Advisory Committee are:

Mr. James A. Waggener, Chairman
  Executive Secretary, Indiana State Medical Association
Mr. Theodore Wiprud
  Executive Director and Secretary, Medical Society of the District of Columbia
Mr. Ralph W. Neill
  Executive Secretary, Washington State Medical Association
Mr. Robert D. Potter
  Executive Secretary, Medical Society of the County of New York
Dr. John E. Farrell (Sc.D.)
  Executive Secretary, Rhode Island Medical Society
Mr. Ralph R. Marshall
  Executive Secretary, New Mexico Medical Society
Mr. Harold Parham
  Assistant Managing Director and Public Relations Supervisor, Florida Medical Association
Mr. Don Taylor
  Executive Secretary, Iowa State Medical Society
Mr. George Saville
  Assistant Executive Secretary and Director of Public Relations, Ohio State Medical Association

PRESS RELATIONS

Annual Meeting.—The 1956 Chicago meeting attracted a near-record press room registration of 144 reporters and writers, exceeded only by the 1953 New York meeting and the 1955 Atlantic City meeting. In addition to advance packets of news releases mailed to science writers, newspapers, and magazines throughout the country, the press section for the first time sent out an advance program containing abstracts of scientific papers. Another innovation was use of a new photo copying machine which made multiple copies of important papers available in the press room and for special requests after the meeting. Improvements also were made in the system of supplying and explaining House of Delegates resolutions to the press. All of these new procedures brought favorable comments from reporters and writers. During the meeting, press conferences were held with the Distinguished Service award winner, with a gastroenterological specialist on President Eisenhower's illness, and with delegates and officials concerning an important resolution on medical education. After the meeting the press section handled an unusual number of requests for additional information and copies of scientific papers.

Clinical Meeting.—Press registration for the 1955 Clinical Meeting in Boston totaled 68, which was more than double that of the 1954 Miami meeting. In addition to advance press packets and news releases written during the meeting, coverage included press conferences with Dr. Paul Dudley White, with the General Practitioner of the Year, and with several physicians on the scientific program.

Special Conferences.—There was marked increase in both the volume and variety of the Department's work in providing advance press room and follow-up news coverage for annual conferences and special meetings sponsored by the Association. Meetings covered were three regional medicolegal symposiums sponsored by the Law Department, Conference on Physicians and Schools, Civil Defense Conference for county medical societies, Mental Health Conference for state medical societies, Congress on Industrial Health, Congress on Medical Education and Licensure, and Conference on Rural Health. In addition to advance stories in the regular American Medical Association weekly news release and many other releases written during these meetings, more than 50 advance releases and 7 summary stories were sent to special lists totaling approximately 3,500 publications, writers, organizations, and interested individuals.

Special Releases.—Wide press distribution was given to special news releases concerning the Chronic Illness Commission, Sears-Roebuck Foundation grants, chemical health hazards, Ford Foundation grants, Joint Blood Council, and Association staff appointments. A feature style release was prepared for local use whenever the medicolegal mock trial is presented at one of the regional medicolegal symposiums.

Weekly News Release.—Based mainly on newsworthy articles or editorials in THE JOURNAL, *Today's Health*, and the A. M. A. specialty journals, the weekly news release of from three to five stories was sent to more than 2,000 publications every week, except during the annual and clinical meetings. Use of the weekly release is steadily increasing, both as straight news and as the basis for local feature stories.

MAGAZINES, TELEVISION, AND FILMS

Magazine Relations.—Editors and writers made 173 requests, ranging from specific questions on medical subjects to the checking of manuscripts. Screening of all general magazines with a circulation over one million showed a total of 387 articles or medicine and health. Summaries of popular health articles were published each week in THE JOURNAL, and the department also maintained a reference file listing health articles by author, subject, and title. Liaison with magazine editors and writers wa continued by means of personal letters, personal interviews, an mailing of the weekly news release.

New TV Committee.—A new 12-man Physicians Advisor Committee on Television, Radio, and Motion Pictures was estal lished to assist the Department in improving liaison with thos mediums. Operating primarily in the Los Angeles and New Yor areas, which are the major production centers, the committee provides technical assistance and advice to producers, networks, and script writers on shows involving medicine or health.

New TV Series.—In May, 1956, a contract was signed with the CBS television network for American Medical Association participation in a new dramatic series on forensic medicine to be titled "Probe." Through the new Physicians Advisory Committee the Association will supply technical assistance in planning, scripting, producing, and presenting the series.

General Activities.—In addition to special requests, the Department continued to cooperate in presentation of the "March of Medicine" series over the NBC-TV network and the weekly "Medical Horizons" over the ABC-TV network. Close liaison was established with network script clearance and publicity departments. Advance news of network shows involving medicine or health was published in THE JOURNAL. "Television News" was sent monthly to state and county medical societies to provide a regular roundup of pertinent, helpful information. Association films: "A Life to Save" was shown 193 times to an estimated 9,050,000 television viewers, and "Operation Herbert" was presented 130 times to approximately 5,140,000 viewers. The Department answered numerous requests from state and county medical societies for advice and materials in planning, producing, and promoting local television programs.

New TV Film.—Negotiations were completed for production of a new half-hour filmed television program, "Even For One," emphasizing the "human" qualities of the practicing physician, for use over local stations.

New Membership Film.—The Department provided script outline, material, and liaison for production of a 27-minute American Medical Association membership film, "The Case of the Doubting Doctor," designed to show how the Association serves its members. Produced primarily for showing before medical audiences, the film had its premiere Aug. 29 at the American Medical Association Public Relations Institute.

Other PR Films.—In showings at schools, clubs, churches, and similar places, the numbers of people viewing Association films were as follows: "Your Doctor," 285,999; "A Life to Save," 84,084; and "Operation Herbert," 63,482.

Literature Distribution

The Department distributed a total of 4,147,327 pamphlets, leaflets, brochures, and reprints. A major new piece was the 12-page pamphlet "To All My Patients," of which more than three million copies were distributed for use by doctors in promoting better physician-patient relations. Other leading items of distribution were the health series ("Quack," "On Guard," "Health Today," "Why Wait?"), total of 695,847; "A Clinical Analysis of H. R. 7225," 235,000; "What's Up with Our Medical Schools?" (revised), 62,000; "Winning Ways with Patients," 11,488; and "Needed Now" (on the Social Security issue), 8,600. New and old pieces available for distribution totaled 74.

Special Projects

Medical Education Week.—The Department handled the Association's participation in Medical Education Week, observed nationally from April 22-28 and co-sponsored by the American Medical Association, Student A. M. A., Women's Auxiliary to the American Medical Association, Association of American Medical Colleges, American Medical Education Foundation, and National Fund for Medical Education. National and local promotion was integrated by a national coordinating committee and more than 1,000 community coordinating committees. This Department's principal responsibility was in promoting establishment of the local committees, coordinating their activities, and supplying them with complete kits of program materials and suggestions. National and local efforts brought extensive publicity in newspapers, national and professional magazines, network and local radio and television programs, salutes by national and local advertisers, and endorsements or proclamations by President Eisenhower, 26 state governors, and 28 mayors.

National Science Fair.—The Department handled the Association's first-time participation in the National Science Fair, sponsored by Science Clubs of America and held May 10-12 in Oklahoma City, where 213 high school students exhibited as finalists from 110 regional science fairs. An American Medical Association six-member judging committee from the Council on Scientific Assembly awarded citations to the four best exhibits in the basic medical sciences. The two top award winners then came to Chicago as guest exhibitors at the Association's 105th annual meeting, where their presence occasioned much favorable comment and publicity. The House of Delegates at the Chicago meeting commended this department for its work on the science fair project and urged that the Association "continue to use every resource at its command to bring the whole of organized medicine into active participation in this worthwhile and constructive program to encourage the youth of our nation to take a serious interest in the field of science as their career."

Farm-City Week.—The Department handled the Association's participation in the first observance of Farm-City Week, held nationally Oct. 23-29 under the sponsorship of a large number of industries and farm, civic, and professional organizations, with Kiwanis International as the coordinating agency. The Department publicized the event among medical societies, provided them and their auxiliaries with specific activity suggestions, supplied promotional literature, and promoted the observance through The Journal and other publications.

"Meet Medicine" Luncheon.—The Department conceived and carried out all arrangements and publicity for the "Meet Medicine" luncheon at the Chicago annual meeting. Through this new feature, 150 Chicago leaders in politics, industry, religion, banking, insurance, education, the law, civic work, the arts, business, and philanthropy had lunch at Navy Pier with American Medical Association officers and delegates and then toured the scientific and technical exhibits.

Public Opinion Survey.—"What Americans Think of the Medical Profession," a two-volume survey conducted for the Association by an independent research organization under the supervision of the Department, was analyzed and publicized extensively to both the public and the profession as follows:

Two separate news releases, timed for Feb. 8 and 15, were sent to a total of 6,207 newspapers, wire services, radio and TV news editors, magazines, free-lance writers, medical and allied publications, state and county medical society officers, editors, and PR executives, American Medical Association officers, delegates and department heads, and a wide variety of individuals, groups, and institutions. Three mimeographed summaries, one with the first release and the other two with the second release, were sent to about half of the mailing list of 6,207.

A 68-page summary booklet, illustrated with charts and graphs, was printed in quantity of 10,000 copies, 3,000 of which were sent immediately to state and county medical society executives, allied medical organizations, and Association officers and delegates.

Two special articles and one editorial were published in two issues of The Journal to coincide with timing of the news releases. Three editorials were sent to state and county societies, and editorial material was distributed through a syndicate service to weekly newspapers throughout the country. Visual aids were prepared for use with speeches on the survey. News items were placed in the Secretary's Letter and A. M. A. News Notes. Personal contact was made with national news magazines and Chicago newspaper science editors. Numerous newspapers, hospital and medical publications, and others were provided with special-interest material. Hundreds of requests were filled for additional copies of the news releases, summaries, booklet, and full survey report.

Results, as indicated by analysis of the first 300 clippings received, show an unusually extensive use of both news stories and editorials in papers of all sizes throughout the nation.

H. R. 7225.—In cooperation with officers and other departments of the Association, this Department carried out an intraprofessional education program to acquaint physicians with the proposed disability amendment to the Social Security Act. This work included the writing and/or production of 14 different booklets, pamphlets, and reprints; special articles and an editorial for The Journal; several speeches or speech inserts; an editorial for state and county society publications; report material for the Board of Trustees; special letters from Dr. Hess to members of the Association and to members of the U. S. Senate; and a study conference for representatives of state medical societies.

Services to State and County Societies

A. M. A. News Notes.—Twelve issues of this monthly newsletter were distributed to state and county editors, state executive secretaries, and headquarters department heads and guides, to keep them informed on new Association activities and services.

PR Doctor.—Five issues of the PR Doctor Newsletter and Exchange, containing news, suggestions, and examples of medical society public relations activities, were produced. Distribution to medical society personnel was 4,500 for the newsletter and 250 for the newsletter and exchange.

PR Packets.—The Department continued distribution of the 11 informational packets already made up and planned the addition of several new titles in the latter part of 1956. State and county societies were surveyed in April for up-to-date material on member indoctrination, anniversary celebrations, and medical society-sponsored newspaper health columns.

House of Delegates Report.—At both the Boston and Chicago meetings a roundup story on House of Delegates actions and convention highlights was mailed out on the final day to about 715 delegates, state and county editors, and medical society officers and personnel. The total run on the report, to meet additional requests after the meetings, was increased from 800 at Boston to 975 at Chicago.

Services to Councils, Bureaus, and Committees

Special Conferences.—In addition to the press coverage already described, the Department provided summary stories in The Journal on the Congress on Industrial Health, Conference on Rural Health, Conference on Physicians and Schools, Law Department Medicolegal Symposiums, Congress on Medical Education and Licensure, and Conference on Medical Care in the Bituminous Coal Mine Area. The Department also arranged and coordinated radio and television coverage at the industrial health and rural health meetings.

Chronic Illness Newsletter.—In cooperation with the Council on Medical Service, the Department produced three issues of this four-page newsletter formerly handled by the Commission on Chronic Illness. Distribution is about 11,000.

Mechanical Quackery.—In cooperation with the Bureau of Investigation, the Department wrote and produced a threefold, eight-panel, two-color pamphlet on mechanical quackery and also prepared a one-page promotion flyer for mailing. Distribution total so far is 13,000.

General Services.—The Department assisted several other departments in the writing, editing, and production of numerous pamphlets, booklets, digests, and reports, and also handled promotion of the American Medical Association Employee Credit Union for the Personnel Department.

Presidential Inauguration Program

For the fourth consecutive year the Department handled all arrangements, script writing, promotion, and publicity for the presidential inauguration ceremony at the annual meeting. This year's program, held at the Chicago Civic Opera House and including the Bluejacket Choir of the Great Lakes Naval Training Center, was attended by 2,000 people. An additional 100,000 Chicago area viewers saw a half-hour portion of the program over Television Station WBKB. For the first time, part of the President's inaugural address was filmed in advance and distributed to television stations throughout the country for use on news programs. The filmed material was used by more than 100 stations and seen by an estimated 10 million televiewers. Dr. Murray's inaugural address, entitled "The Personal Touch in Medicine," was printed in booklet form for distribution.

Services to President and President-Elect

Activities of the executive assistant assigned to the President and President-Elect included the following: 19 trips covering 64 days and 21,000 miles; assistance in the preparation of 21 speeches; 10 special press releases; 25 press interviews; arrangements for 15 radio interviews and 10 television appearances; six special articles and several short statements for periodicals; collaboration in the writing of 12 President's Pages for The Journal; preparation of the President-Elect's biography; assistance with correspondence and itineraries; and the filling of requests for special materials or information.

Miscellaneous Services

In addition to work mentioned in all the foregoing categories, Department staff members also arranged the 1955 Public Relations Institute in Chicago and the Eighth Medical Public Relations Conference in Boston; published the Daily Bulletin at the Boston and Chicago meetings; prepared monthly Public Relations Pages for The Journal; distributed 1,200 "Lessons for Living" kits at the General Federation of Women's Clubs annual convention; supervised the Association's guided tour program which this year accommodated nearly 1,000 visitors; assembled kits on medical assistants for medical societies and assistant's groups; distributed 400 packets on socialized medicine; continued the sale of "To All My Patients" office plaques; handled production of 22,000 copies of the general program at the Chicago annual meeting; supervised photography and filled requests for prints at the Boston and Chicago meetings; assisted in the writing, reproduction, and distribution of the Secretary's Letter; continued reorganization and coordination of mailing lists in this department and others at Association headquarters; wrote at least 10 speeches for Association officers and trustees, in addition to those for the President and President-Elect; and attended meetings of councils and committees as liaison representatives of the department.

Field Trips.—The Director of the Department fulfilled 39 engagements to speak before or attend meetings of medical societies and other organizations. In addition, the Assistant Director, Director of Press Relations, and other staff members made a total of 38 trips for the same liaison purposes.

Conclusions

The Department feels that continual progress is being made in formulating, improving, expanding, and carrying out a sound medical public relations program based on positive principles and activities. The Department wishes to express its appreciation to the House of Delegates, officers and Board of Trustees of the Association, the state and county medical societies, and the departments and staff members at Association headquarters for their cooperation and help during the period of this report.

Report of the Council on Mental Health

Since its last annual report the Council on Mental Health has held three Council meetings: September, 1955; February, 1956; and June, 1956. The Executive Committee of the Council, composed of Drs. Leo H. Bartemeier, Lauren H. Smith, and Walter Baer, has met twice. The matters of primary consideration to the Council during the past year have been the preliminary work concerned with setting up the Joint Commission on Mental Illness and Health, Inc.; considerations with respect to problems of the medical use of hypnosis; deliberations concerned with organized medicine's attitude toward problems of narcotic addiction; problems surrounding hospitalization of patients with alcoholism in general hospitals; legal certification of clinical psychologists; and the development of a closer liaison between the Council and committees on mental health of the state medical associations.

Joint Commission on Mental Illness and Health, Inc.

About two and a half years ago a small group from the American Psychiatric Association, led by their then president, Dr. Kenneth E. Appel, and members of the Council on Mental Health of the Association held a series of informal meetings with a view to finding out how the Association could best work with the American Psychiatric Association to accomplish something that would be of continuing value in the field of mental illness and health. The consensus of these discussions was that what was now urgently needed was a new over-all review of the present status in this field, and a search for ways in which the present approaches could be improved. This led to the setting up of the Joint Commission with full and formal recognition by the official bodies of the American Psychiatric Association and the American Medical Association. It was then recognized that in such an all-embracing undertaking many additional organizations whose work was closely tied in with the problems of mental illness and health needed also to be included because of the definite contributions they could make. Some 20 such national organizations were then invited and accepted participation.

The Joint Commission was legally incorporated as a nonprofit organization in mid-1955, with Dr. Leo H. Bartemeier, Chairman of the Council, as chairman of its board of trustees, along with four other members of the Council appointed by the Association as members of a 15-member board. Fortunately for the Commission, the "Mental Health Study Act of 1955" passed by Congress allotted the sum of $1,250,000 for a nationwide study of mental illness and health. The Joint Commission applied for these funds through the National Institute of Mental Health and was granted a sum of $250,000 to start work in January, 1956. Under the direction of Dr. Jack Ewalt as principal research investigator, headquarters offices were set up in Cambridge, Mass., in mid-February, 1956. The over-all research model which has been set up for the work of the Commission, concentrates the attention of the study on people and what happens to them in our society. Starting with considerations of people's genetic, biological, psychological, and cultural background, the model envisions a study of individuals as they relate themselves to critical stages of development, from birth through preschool and working periods, and as they relate themselves to family, church, marriage, and other sociocultural factors in our society. In these respects the study will attempt to find out what these sociocultural institutions do to and with people that contributes toward or inhibits the development of an effective emotionally functioning person. For those persons who do not achieve this status, the study will include an investigation of the nonprofessional helping agencies in the community to find out what they actually achieve, a study of professional people and agencies, to find out what they achieve after the person has arrived at the status of patient, and a study of the hospitalized patient situation. The Joint Commission believes that there are vast numbers of persons in America, perhaps hundreds of thousands, who for long periods of their lives go through agonizing mental and emotional disturbances who do not receive help from any source. The Commission, in its study, wants to find out who and where these people are. The Commission believes also that there are perhaps millions of persons who weather these same emotional storms successfully without help from any organized source. It therefore, as part of its study, wishes to find out how these people help themselves.

In its development so far, the Commission has set up task forces in the areas of mental health processes in schools, a resurvey of mental health and illness research, a mental health and illness manpower study, and a national sampling opinion survey in an attempt to elucidate the real, and perhaps unrecognized, mental health problems of the general population. These studies are being undertaken in collaboration with personnel of Harvard University, the University of Michigan, the University of Texas, and New York University.

Other areas that the Commission plans to enter in the proposed three-year study include patterns of patient care in the mental hospital, general hospital, and the community; a study of law as it relates to mental health, delinquency, court and penology practices; the economics of mental illness; religion as it relates to mental health; epidemiology of mental illness; and the mental health aspects of military and family life and leisure time activities. The expected total financial needs of the Commission for three years will be approximately 4 million dollars.

Medical Use of Hypnosis

During the past two years there has been a rapidly increasing interest in the medical profession about the possible values and uses of hypnosis in medical practice. During this time, the Council has received repeated inquiries concerned with what the attitude of medicine generally should be with respect to hypnosis in practice. In addition to this, the Council has received repeated inquiries concerning short two-to-three-day courses that are being set up throughout the country by so-called "schools" of hypnosis teaching that are not sponsored by any university or medical school. There are also some "schools" of this nature that are advertising courses in the practice of hypnosis as correspondence courses. These matters have been discussed at Council meetings frequently, and in view of the obvious need for an official medical opinion concerning use of hypnosis in medicine, the Council has set up an *ad hoc* committee under the chairmanship of Dr. M. Ralph Kaufman, Council member, to review the present status and use of hypnosis in American medicine. The committee is at the present time making an extensive review, primarily of the American literature, on the medical use of hypnosis, and has prepared a bibliography for physicians of the books pertinent to this subject, which is available from the Council office.

The Council has also reviewed the report of the British Medical Association on "Medical Use of Hypnotism" and the summary of this report which was published in The Journal. It was the view of the Council members that the British position was a position that American medicine might well adopt; however, it was felt also that, before an official opinion in this respect was adopted by the Association, a representative group in the field of American medicine should be brought together to discuss this whole area. In view of this, Dr. Kaufman has called a representative group from American medicine to a joint meeting of the Council acting as a committee of the whole, for Sept. 18, 1956, at the Drake Hotel, Chicago. The Council expects that from this meeting it will be in a position to develop a report for presentation to the Board of Trustees so that it can take official action toward adopting a policy regarding medical use of hypnosis that will reflect the opinion of American medicine generally.

Committee on Narcotic Addiction

On Sept. 10, 1955, the members of the Council on Mental Health and members of its Committee on Narcotic Addiction met together for a one-day meeting with representatives of the Medical Society of the State of New York, the New York Academy of Medicine, the U. S. Bureau of Narcotics, the American Bar Association, and the Chicago Police Department. The main subject under consideration at this meeting was whether the Council might wish to make recommendations to the Board of Trustees that would reflect the present attitudes of American medicine toward the control and treatment of narcotic addiction and whether present attitudes required change. Dr. Robert H. Felix, chairman of the Council's Committee on Narcotic Addiction, reviewed the background viewpoint of American medicine toward narcotic addiction, which was essentially that adopted by the House of Delegates in 1924. Dr. Felix indicated that the present position, as adopted in 1924, was that: (1) The American Medical Association expresses opposition to the ambulatory treatment of narcotic addicts either by a private physician or in a so-called clinic; (2) the Association strongly urges the state and national authorities to put an end to this kind of treatment; (3) the Association recommends the strict enforcement of national and state narcotic acts to eliminate the illicit supply of drugs; (4) the Association recommends the establishment of special institutions for the treatment of addicts, both by the state and by the federal government; (5) the Association deplores and condemns "skript" doctors, that is, physicians who provide addicts with prescriptions under the guise of treatment; and (6) the Association recommends the follow-up and supervision of addicts following their discharge from a hospital.

Dr. Felix indicated that this program has been largely followed, with the exceptions that the number of hospitals established for the treatment of addicts, even including Lexington and Fort Worth, were still insufficient and that clinic follow-up for addicts once discharged from hospitals has been almost negligible.

Each of the groups represented were given opportunity to discuss the present position. There were widely divergent opinions offered. Representatives of the U. S. Bureau of Narcotics felt that its program, pursued since 1924, had been effective in that there had been an actual drop in the number of addicts in the United States from about 150,000 at that time to an estimated 60,000 today. Representatives of the other groups believed that the present method of taking care of the narcotic problem in the United States was a punitive rather than a medically oriented program and that there was no way of accurately estimating the present number of narcotic addicts in the United States. They felt also that the present methods of enforcement of the Harrison Act were punitive as far as medical practice itself was concerned, and were in effect preventing narcotic addicts from obtaining the help they need from the medical profession. They further stated that the narcotic clinics that had been opened around 1919, for the most part, had not been given a fair trial, and suggested that the medical profession should now take under consideration a reorientation in the handling of the narcotic problem so that these patients could be cared for under a medical orientation rather than a punitive legal one. They also suggested that the present methods of enforcement of narcotic control were greatly increasing the illicit importation of drugs into the United States and thereby maintaining a "narcotic racket" and increasing the number of addicts through proselyting by users and peddlers.

A member of the American Bar Association, reviewing the problem legally, suggested that the present methods by which physicians are controlled in their use of narcotics by the Bureau were unlawful in that in the latest decision of the Supreme Court, the so-called "Linder" case, the court had indicated that the Harrison Law was not to be construed as an intent to regulate medical practice in the states when a physician was using drugs in good faith and in the ordinary course of his duties to his patients.

The complete proceedings of this meeting are mimeographed and available at Council headquarters offices. The Council so far has made no recommendations to the Board of Trustees based on this meeting but will reconsider the whole matter again with its Committee on Narcotics for the purpose of reaching a series of recommendations that can be sent to the Board of Trusteess and that, if adopted, would represent a more current view of American medicine toward the entire narcotic problem.

Committee on Alcoholism

The Council's Committee on Alcoholism has had three regular meetings since the last annual report. This Committee has been concerned primarily this year with the problem of hospitalization in the United States for patients with alcoholism, the drawing up of a series of articles on modern methods of treating alcoholism, the dissemination of information through its alcoholism exhibit developed last year; and the dissemination of information on alcoholism to physicians through the use of the "classified abstract archives of alcohol literature" which has been set up at Council headquarters.

With respect to the hospitalization of patients with alcoholism, the Committee has drawn up a "Resolution on Hospitalization of Patients with Alcoholism," which was presented to the Council. After a joint meeting with the Council at which changes and corrections on the resolution were made, the resolution was forwarded to the Board of Trustees for consideration and/or approval in June, 1956. A program is now under way for the development of a treatment manual to be developed as a series of articles dealing with modern medical and psychiatric treatment approaches to alcoholism including also articles on the physiological and sociological approach to this problem which it is hoped will be published as a series of special articles in The Journal during the coming year.

Mass Mediums

For the past three years the Association, through the Council, has been supporting a study of the effects of mass mediums, including radio, television, and comic books, on children. These studies have been carried out through a cooperative arrangement between the Council and the Laboratory of Human Development at Harvard University and the department of psychology at Boston University under the general direction of Dr. Nathan Maccoby, chairman of the department of psychology at Boston University. It is expected that a full report on these studies will become available late in 1956. However, a preliminary report made in August indicates that the following studies under the grant have been completed or are under way: (1) the effect of different types of aggressive film content upon children's aggressive responses and identification choices; (2) a study of exposure habits to the mass mediums and their cognitive effects; (3) the effects of mass mediums as a socializing agency; and (4) the effects of emotional arousal on retention of aggressive and nonaggressive moving picture content.

It had been the original hope that these preliminary studies might lead to the development of a large-scale research proposal on the effects of mass mediums on children, with a request for foundation support. However, the present feeling of the investigators is that at the present time the problem can best be tackled by a series of small-scale studies by individual researchers, allowing for a high degree of research integration through the usual channels of scientific communication such as professional meetings and professional journals. The final reports on the studies mentioned should be available in December, 1956.

Conference of Mental Health Representatives of State Medical Associations

On Nov. 18 and 19, 1955, the Council sponsored a second annual conference of mental health representatives of the state medical associations to consider common problems in the mental health and illness field. The conference was held at Chicago headquarters. It was chaired by Dr. Leo H. Bartemeier, Council Chairman, and welcoming addresses were given by Dr. Elmer Hess, President, and Dr. George F. Lull, Secretary and General Manager of the Association. The general subjects for discussion were: (1) the narcotics problem, with particular reference to the attitude of the American medical profession; (2) the integration of public mental hospitals within the total medical community; (3) future relationships between medicine and clinical psychology; (4) the development of committees on mental health at county medical society levels; (5) what a mental hygiene clinic should be from the medical viewpoint; and (6) the present development of the Joint Commission on Mental Illness and Health. Dr. Ernest B. Howard, Assistant Secretary of the Association, and Dr. Nicholas Dallis, developer of the Dr. Rex Morgan strip, were speakers at the dinner meeting.

The proceedings of this conference have been published and distributed to all state medical associations, and copies are available at the headquarters office. A third conference has been scheduled for Nov. 16 and 17, 1956.

The conference developed a "resolution on composition and tenure of mental health committees of the state medical associations." In this resolution, the conference members unanimously agreed that such committees, in order to maintain continuity, should be appointed for terms of three to five years, with at least one member being replaced annually. They further agreed that such committees, in order to function most effectively, should have representation not only from psychiatry, but also from such other fields as surgery, internal medicine, pediatrics, public health, and general practice, and such other specialty representation as would be particularly appropriate for the area.

Headquarters

The interdepartmental contacts of the Council have been increasing rapidly over the past two years. Dr. Francis J. Gerty has been recently appointed to represent the Council on the newly created Intra-Association Committee on Rehabilitation.

The Council has had considerable supervisory contact with the Woman's Auxiliary to the Association in the development of its own program on mental health promotion. This year the Council has reviewed and approved a program in mental health for the Auxiliary, stressing the need for developmental work along the lines of providing mental health services and hospitalization for children with mental illness, an area that has been grossly neglected over the past years. Council members have also been active in providing material for congressional hearings on such matters as legislation with respect to narcotic addiction and the need for increased funds for mental health research. The Council is also at present cooperating with the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association in the development of a brochure for use in mental health teaching in the schools. This work is being carried out through the agency of the Judge Baker Clinic in Boston under the direct supervision of Council member Dr. George Gardner.

There have also been increasing demands for consultation and advice from the Council to mental health committees of the state medical associations. With respect to the development of the Joint Commission on Mental Illness and Health, the Secretary, Dr. Richard J. Plunkett, has been loaned on a part-time leave basis to act as Associate Director of the Commission at its headquarters offices in Cambridge, Mass.

Requests for liaison contacts from the Council are increasing rapidly. These include requests for liaison contact from such organizations as the American Nurses Association, the National League for Nursing Education, the American Association for Mental Retardation, the National Epilepsy League, Inc., and the American Bar Association. For the most part these requests have been satisfied on an informal liaison basis through the headquarters offices or the executive committee of the Council, which is also set up as a liaison group.

Report of the Council on Rural Health

The Council on Rural Health is grateful to the Board of Trustees, the House of Delegates, and the management of the American Medical Association, and to the constituent state medical associations and their staffs for the encouragement, support, and cooperation it has received during the past year. The Council regards this as its most profitable year of operation since the Committee on Rural Health was established in 1945 and since it became a Council. Progress has been made in many fields. Certain of the controversial subjects that existed at the outset of the work of this Council have disappeared from many areas. The point has now been reached where programs can be developed with state medical associations and lay organizations that are well planned and in the long-time interest in both the practice of medicine and the health of the people of rural America.

The Council is grateful also to the many farm organizations, educational agencies, and groups with whom it has been privileged to work during the past year, for their cooperation, support, and understanding. These organizations have displayed a magnificent spirit of cooperation in which the Council on Rural Health and the American Medical Association have developed an unusual sharing of the profit motive from every point of view. We believe that during the past year we have advanced the understanding of sound practice of medicine among these organizations throughout the nation to a greater degree than has been done before. Moreover, we have been privileged to work with these lay organizations in broadening their understanding of the lay responsibility for lay programs of health, for which medicine in times past has been charged as having the total responsibility, but in which they can only carry their proportionate share and serve as leaders and guides in the broad field of understanding and mutual assistance.

We have made ourselves available to all types of organizations at all levels of their endeavor throughout the country. We have supplied information and consultation wherever the opportunity was presented. We have assisted them in developing their own programs to meet their needs. We have continued to pursue the "old fashioned virtue" of self-help and have had wide acceptance of our basic philosophy that any problem that exists in any community in America can be solved by the people and the resources that are already available in the community or which are available to the community from the outside. We believe this combination of personal and community responsibility in these affairs has greatly lessened in all cases the once commonly accepted thought that programs in health and medical care could be solved from a central source in government.

The nine regional directors of the Council have functioned throughout the year with one replacement. The death of Dr. Henry Randel of Fresno, Calif., who served the Pacific coast and far western area of California, Nevada, and Arizona, made necessary the replacement in that position. Dr. Robb Smith of Orange Cove, Calif., was appointed to the Council, but later, due to his resignation, Dr. Carroll B. Andrews of Sonoma, Calif., replaced him.

Every state medical association has carried a rural health program of one type or another during the year. Forty-four states have been very active in this regard, with each of them continuing their committees on rural health and the liaison relationships with the organizations interested and active in this field. New Mexico has recently appointed a committee on rural health which is just beginning its activity.

In 24 states health conferences or other similar activities in lieu of state conferences were held during the last year. In some states, the conferences were broken down into regional meetings in addition to a statewide conference. In others they were substituted for the state conference. In all cases, state medical associations and their committees on rural health are staying in close contact with the major farm and rural groups in these states and providing leadership and guidance for their health activities.

In the New England region we have previously not held state conferences. A regional conference was held in April of this year where more than 200 New England rural leaders assembled and spent a day in exploring possible local activities which might be carried on in their states or in smaller regions of the area.

The 11th National Conference on Rural Health which was held in Portland, Ore., March 8-10, was an outstanding success. Although it was held in the far Northwest, there was good national representation. Particularly outstanding this year was the large number of physicians attending and participating. In addition, we had the largest number of lay rural leaders that has attended any of our conferences. The participation of all the groups was good, their interest ran high, and we believe it to be the most successful conference we have held.

During the past year the Field Director has visited 41 states. Some, of course, were visited a number of times. A good deal of time was taken in visiting the states of the Northwest which were eager to support the National Conference in Portland, Ore. He worked with them in developing plans for attendance, getting suggestions for the program, and in getting personnel to carry out the suggestions they made. It is believed that this has been one of the more profitable activities, because the conference was one of the most successful that the Council has held.

During the year the Field Director prepared manuscripts for two pamphlets which are in special demand by various lay organizations. One of these is entitled "A Member of the Family—Your Doctor" and the other, "Check and Know."

The Parade of Progress has been prepared and issued periodically and fills a need for both medical associations and rural organizations as an idea exchange.

Constant liaison has been maintained with the leaders of national farm organizations, the Land-Grant Colleges, the Agricultural Editors Association, and many other national organizations, as well as the state units of these component groups.

About 90% of the Field Director's time has been spent in traveling from state to state promoting the program of the American Medical Association and the philosophy of the Council on Rural Health. Many radio and television appearances have been made, public speaking engagements fulfilled, new contacts established during the year, and old ones strengthened.

The chairman of the Council believes this has been the most successful year of the Council's existence. The National Conference was the highlight of the year's activities insofar as public functions are concerned. An analysis of the attendance showed that the largest number of community lay leaders were in attendance of any year. It was the largest total attendance of any of the conferences, and the enthusiasm of the group ran higher than heretofore. It is acknowledged that this attendance was somewhat limited to the Northwest, but the purpose of rotating the conferences around the United States has been to reach lay leaders in local regions who would not otherwise be reached if the meeting were held at one central point. An optimum number of old and faithful friends were at this meeting and these have been the reliable and devoted supporters of the program from its inception.

During the year the Council organized a new service for farm magazines of the United States which came about as a result of the request from the advisory members representing the Agricultural Editors Association. This service, though organized and prepared now, will go into effect early in the fall. Physicians who are members of state rural health committees have prepared items for the magazine service. These are rewritten by a person especially qualified and employed by the Council and then rechecked by the original author. They are to be given to the state farm magazines in an orderly monthly basis.

We continue to receive the wholehearted support of many organizations with which we have been associated through the years and our philosophy and support seems to be gaining acceptance and respect throughout the nation.

This year we again cooperated with Texas A & M College and the Agricultural Extension Services of the 15 southern states in supplying a teacher for a course in health organization for negro county extension agents. The course was taught at Prairie View College for Negroes, a part of the Texas A & M system. The teacher was Miss Helen Robinson, Extension Health Education Specialist, University of Arkansas Agricultural Extension Service. She is well known to Arkansas physicians and to extension people through the nation. She was ably assisted by Mr. Donald Anderson of the Texas Medical Association and other personnel he provided.

The Council office, in addition to regular routine duties, has acted as a clearing house of information for various health services of organizations and agencies in rural areas. It also continues to maintain a close working relationship with state medical societies and state committees handling rural health matters, and maintains a current roster of all state rural health committees. In addition, the office handles special assignments delegated by the chairman and members of the Council, which include attendance at state rural health meetings, annual sessions of national farm groups, inspection trips to various parts of the country in connection with future sites for the national conferences, and making definite arrangements for the conferences after final approval by the Council.

A mailing list of approximately 1,600 names is kept current for the Parade of Progress Newsletter, as well as a mailing list of approximately 5,000 in connection with invitations to the national meetings. Three issues of the Newsletter have been printed and distributed during this period.

In the carrying out of plans for the 11th National Conterence, a preconference flier and a conference program were designed, printed and distributed, as well as approximately 5,000 personalized invitations. A digest covering the 11th National Conference was compiled and approximately 4,000 copies have been distributed.

Arrangements were made for one advisory meeting which was held jointly with the Council, two council meetings, and one executive meeting during this period. Approximately 22,403 pieces of material have been sent out during this fiscal period.

Report of the Division of Councils of Therapy and Research

The Division of Councils of Therapy and Research was created by action of the Board of Trustees on Nov. 5, 1955, and a Director appointed. The Division consists of the Council on Pharmacy and Chemistry, Council on Foods and Nutrition, Council on Medical Physics, Committee on Research, Committee on Pesticides, Committee on Toxicology, Committee on Cosmetics, Bureau of Investigation, and American Medical Association Laboratories.

The seal-acceptance programs of the American Medical Association were discontinued as of Feb. 15, 1955, and during the past year the Director has assisted and advised in the creation or improvement of new programs of operation for various departments within the Division in order that they can render a better service to the medical profession. The detailed report of the new program of the Council on Pharmacy and Chemistry was published in the July 30, 1955, issue of THE JOURNAL. The Oct. 22, 1955, issue of THE JOURNAL contained a description of the new program of the Council on Foods and Nutrition.

During the past year the editorial section of the Division has checked the various department reports, monographs, statements, and books for correctness of grammar and uniformity of style prior to their publication.

Numerous inquiries pertaining primarily to general or specific aspects of drug therapy or research have been answered directly by the Director of the Division.

As Chairman of the Association's Advertising Committee, the Director of the Division has screened all proposed advertising copy for American Medical Association publications in order to effect compliance with the Association's principles governing advertising and to maintain high standards.

Report of the Council on Pharmacy and Chemistry

This annual report of activities of the Council on Pharmacy and Chemistry covers the period from July 1, 1955, to June 30, 1956. In passing it is appropriate to record the completion of the Council's 50th year of service to the medical profession, which occurred on Feb. 11, 1955, during the previous report period. The 50th anniversary year was commemorated in an editorial appearing in THE JOURNAL of the American Medical Association for Dec. 3, 1955. This event was further highlighted by the presentation before the House of Delegates on Nov. 29 at the 1955 Clinical Meeting in Boston, of a special citation to the Council's charter member and chairman since 1936, Dr. Torald Sollmann, in recognition of his many years of outstanding service to the medical profession and on behalf of the advancement of medical science.

Of importance early in the current report period was the publication of a statement by the Council in THE JOURNAL of July 30, 1955, outlining its new program of operation for evaluation of drugs which had been instituted during the previous annual period on Feb. 15, 1955. The altered procedure for evaluation of drugs provided under the revised program subsequently was reflected by a change of format in the New and Nonofficial Remedies section of the Council's column of THE JOURNAL for Aug. 27, 1955. Of incidental interest was the appointment of Dr. Harold D. Kautz to succeed Dr. Robert T. Stormont as Secretary of the Council, effective at the close of business on Nov. 5, 1955.

The Council held its regular annual meeting Nov. 4 and 5, 1955. Actions taken at this meeting were designed chiefly to bring the content of subsequent editions of New and Nonofficial Remedies into conformity with the Council's revised program of operation. Of primary interest in this connection was the decision to expand the revised program to provide for the alphabetic listing (in conjunction with monographs and the index to New and Nonofficial Remedies) of trade names known to be applied to commercial preparations of evaluated drugs. The Council accordingly adopted a change in operation to permit the listing of such names as a matter of information to aid physicians and others who may be unfamiliar with the nonproprietary terminology under which the Council describes evaluated drugs. This change in operation, effective Jan. 1, 1956, was announced and simultaneously implemented in the Council's column in THE JOURNAL for Jan. 7, 1956, and in the 1956 edition of New and Nonofficial Remedies which became available the first week in May, 1956. At its annual meeting the Council also voted to adopt Oct. 1 instead of Dec. 31 preceding the year of publication as the annual closing date for the 1957 and succeeding editions of the book so as to permit future release as early as January of each year.

The Council launched another important step during the year to increase its service to physicians by another decision, voted at its annual meeting, to consider a list of proposed topics for the publication of reports dealing with the current status of therapy in various diseases. It was felt that such reports, reviewing therapy in diseases or conditions involving the selection of a variety of drugs, would be especially helpful to practicing physicians as a supplement to the Council's regular program for evaluation and description of individual drugs in New and Nonofficial Remedies. Following this decision the Council reviewed a series of approximately 25 topics for such reports and expressed a desire to invite their preparation by selected outside authors. Leaders in various fields were invited to write special reviews of the subjects for publication as reports to the Council, some of which already are in preparation and/or under consideration for future publication.

The 10th edition of the Epitome of the Pharmacopedia of the United States and the National Formulary, periodically revised to provide comments on drugs currently included in these official publications, became available in January, 1956. The 10th edition, based upon the U. S. P. XV and N. F. X, was expanded to serve as a companion volume to New and Nonofficial Remedies by incorporation of more detailed comments on drugs no longer described in the latter publication.

Primarily significant during the current report period was the increasing realization of the advantages that had been gained under the revised procedure for drug evaluation. Elimination of the former tedious listing of commercial dosage forms and the names of manufacturers and distributors in New and Nonofficial Remedies enabled the Council to provide more and earlier basic information on new drugs. Of equal significance under revised procedure was the provision for wider sampling of expert opinion from outside consultants concerning available evidence to support the use of new drugs. The Council found such opinions to be of great assistance in arriving at suitable early conclusions concerning the clinical effectiveness and limitations of drugs. Especially important, the Council found itself free, under the revised program, to evaluate and describe each new drug whether or not currently available evidence was sufficient to establish its usefulness in medicine. Many pharmaceutical and drug manufacturers forwarded data to the Council for evaluation of new drugs and showed increasing interest and desire to cooperate with its revised program.

During the current report period, the Council completed a total of 76 drug evaluations comprising 46 new drugs, 10 additional salts or esters of previously evaluated compounds, 15 proposed new uses, and 5 proposed new routes of administration of previously evaluated drugs. As of June 30, 1956, 26 additional evaluations comprising 21 new drugs, 4 new uses, and one additional route of administration were also in progress. Over this same period, the Council published in its column in THE JOURNAL a total of 100 new monographs on drugs and 14 supplemental statements on new uses or routes of administration of previously described drugs. This exceptionally large annual number of published statements on individual drugs was accounted for in part by monographs already included in the 1955 and 1956 editions of New and Nonofficial Remedies that had been held for publication until after the appearance of the Council's statement on its revised program, and in part by the accelerated number of drug evaluations which has become feasible under the revised procedure. A total of 58 new monographs on individual drugs was added to the 1956 edition as compared to a total of 39 added to the 1955 edition of New and Nonofficial Remedies.

During this report period, the Council initiated evaluation of approximately 35 older drugs that never had been described in New and Nonofficial Remedies, and invited the cooperation of interested manufacturers in furnishing available scientific data for this purpose. The response of industry has been gratifying and will aid the Council in describing some of the older previously unevaluated drugs in New and Nonofficial Remedies. The Council, however, continues to place primary emphasis on evaluation of new drugs and retains its policy of omitting monograph descriptions for drugs that have been included in the U. S. P.,

N. F., or N. N. R. for a cumulative period of 20 years or that are no longer commercially available. As the Council catches up with previously unevaluated drugs, it is expected eventually that all new drugs can be described in New and Nonofficial Remedies from the time, or shortly after, they become commercially available.

Through the cooperation of American manufacturers and with the assistance of the American Medical Association Chemical Laboratory, the Council considered and adopted during the year a total of 37 nonproprietary names for drugs not then available or evaluated. The Council continues to urge manufacturers to cooperate in the early selection of such terminology for all drugs that are expected to become commercially available in the United States, and routinely transmits all adopted nonproprietary names upon which agreement has been reached to the World Health Organization and the U. S. Pharmacopeia. The rapidly multiplying number of new compounds and the multiplicity of names for existing drugs in the United States has greatly increased the difficulty in developing distinctive domestic nonproprietary terminology for new drugs. Selection of convenient names that are free from conflict in the United States and at the same time suited to the language and terminology used in other countries poses an even greater problem from the standpoint of international nomenclature.

Over the year the Council published a total of five special reports. These included three reports of the Council dealing with the current status of therapy in nausea and vomiting of pregnancy, leukemia, and amebiasis respectively. There were two reports to the Council, one prepared by a representative of the Veterans Administration-Army-Navy conference studies on the chemotherapy of tuberculosis concerning the present status of the treatment of that disease, and one jointly prepared by outside experts on the current status of the drug therapy of epileptic seizures.

During the year the Council staff provided information for various other Association headquarters departments in the form of opinions on inquiries and papers or articles and reviews of books dealing with drugs for publication in The Journal and non-American Medical Association periodicals, nomenclature decisions of the Council for the Library and other interested departments, and opinions on proposed scientific exhibits and medical motion pictures for showing at Association meetings. The Council office also furnished replies to various outside inquiries and requests for specific information on drugs from physicians, pharmacists, and allied groups. The secretary of the Council also addressed several medical and pharmaceutical groups concerning the Council's revised program of operation and attended or participated, with other members of the professional staff, in scientific meetings and conferences of importance to the work of the Council.

Report of the Council on Foods and Nutrition

The past year has seen a great expansion in the activities of the Council on Foods and Nutrition, particularly as they affect the medical profession. The termination of the former seal-acceptance program has resulted in the Council being able to devote much more time to its program of nutrition education. Statements on subjects of current interest and articles on various aspects of nutrition have appeared in The Journal frequently. These articles, all of which have been prepared by nationally known authorities at the request of the Council, have been very popular as evidenced by the large number of requests for reprints.

In the Oct. 22, 1955, issue of The Journal, the Council published a statement explaining in general terms its new method of operation. Since its inception the Council has recognized its responsibility of interpreting the findings of nutritional research and disseminating accurate nutritional information to the physician and to the public. This phase of the Council's activities has been greatly expanded. In addition, the periodic publication of official Council opinions relative to the usefulness and nutritional value of certain types or classes of foods is to be noted. As of June 30, 1956, reports concerning vitamin D milk and certain dietary sources of vitamin C have been published.

The Council also reviews upon request educational food advertising, that is, informative advertising dealing with classes of food without reference to specific brands, processors, or distributors. If such advertising is found to be consistent with current authoritative medical opinion, permission is granted to use a statement indicating this fact. This service of the Council has been widely used by various trade organizations such as the American Bakers Association, the American Meat Institute, the National Dairy Council, and others.

Because of the apparent misunderstanding in connection with vitamin D fortified milk created by the action taken in terminating the Council's seal of acceptance, the Council issued a report on the importance of vitamin D milk, especially in the diet of infants and children. Accompanying the report was a list of certain nutritional qualities that the Council believes are necessary for vitamin D milks. Receiving nationwide notice, the report has served to reemphasize to the physician and to the public that vitamin D milk is an extremely important dietary item.

The publication of the Council report entitled "Importance of vitamin C in the Diet" called the physician's attention to the need for dependable dietary sources of vitamin C, since this is one of the nutrients incapable of being synthesized or stored by the human body. The almost universal use of citrus and tomato juices as dietary sources of vitamin C led the Council to develop certain criteria that it believes are desirable for such products. These criteria were published in The Journal with the aforementioned report. The Council contends and wants to emphasize that such juices should have a certain minimum ascorbic acid content obtained by careful selection and processing rather than by the addition of synthetic ascorbic acid to juice of poor quality. Reports on other types of foods will be published from time to time whenever the Council feels such are indicated.

The current role of vitamin B_6 in the human was discussed in a paper by Dr. Richard W. Vilter entitled "Vitamin B_6 in Medical Practice." Written at the request of the Council, the paper brought out the fact that although vitamin B_6 is a very important nutrient and essential for human beings, deficiency states occur only under unusual circumstances. Therapeutic claims for vitamin B_6 are still obscured by uncertainties.

In a report to the Council entitled "Cirrhosis in Alcoholics—Protein Nutrition and Hepatic Coma" by Dr. Charles S. Davidson, Chairman of the Council, the current status of high-protein diets in the treatment of cirrhosis is succintly reviewed for the general practitioner. When high-protein diets are used in the treatment of cirrhosis, the physician must remain alert to early signs of hepatic coma frequently resulting from such a diet.

The widespread interest of the medical profession on the subject of lipotropic agents prompted the Council to request Dr. George J. Gabuzda to write a report on the subject. This report entitled "Clinical and Nutritional Aspects of Lipotropic Agents" emphasized the role of such agents in the pathogenesis and treatment of fatty cirrhosis of the liver. Although it has been definitely demonstrated that a dietary deficiency of lipotropic factors such as choline and methionine results in fatty cirrhosis of the liver in some species of animals, metabolic studies to date have failed to indicate convincingly that such a deficiency is present in man with liver disease.

Two of the papers presented at the Council-sponsored symposium on "Some Inorganic Elements in Human Nutrition" at Nashville, Tenn., April 4, 1955, were published in The Journal. These were "Magnesium Deficiency Syndrome in Man" by Dr. Edmund B. Flink and "Copper Metabolism in Man" by Dr. Clark J. Gubler.

With the publication of the second cumulative volume of reports from the Institute of Nutrition of Central America and Panama (INCAP), the Council published a brief statement calling attention to the nutritional work being done in the Central America countries. In addition to building an exceptional regional international institute, contributions of highly significant value to the world at large as well as to the Central American region have been made.

In a statement in The Journal, March 10, 1956, the Council also brought to the attention of the physician the recent report of the Food Protection Committee, Food and Nutrition Board of the National Research Council, entitled "The Safety of Artificial Sweeteners for Use in Foods." Because of the wide use of artificial sweeteners in foods for weight reduction diets, the Council felt this valuable report merited special mention.

Whereas the artificial sweeteners—saccharin and the sodium and potassium cyclamates—were deemed safe for use in special diets, the report did not support the unrestricted use of these sweeteners in general purpose foods and beverages.

In spite of the almost universal awareness of the importance of vitamin C, Dr. Calvin Woodruff reported to the Council that there was an increasing incidence of scurvy in the Nashville area. His report entitled "Infantile Scurvy" suggested that a possible etiological factor for this increase might be the increasing urbanization and abandonment of time-honored local feeding practices with failure to ensure an adequate intake of ascorbic acid-containing foods in the infant's diet. Although the Council is unaware of increased incidences of scurvy in other regions, it has requested that it be notified of any other such instances. It is indeed surprising that scurvy occurs at all in this country today; however, the need for constant medical supervision of infant diets and for education of the parents has again been shown to require more emphasis.

At the request of the Council Dr. E. M. Nelson of the Food and Drug Administration wrote a brief summary of two conferences on antibiotics that were held in Washington, D. C. in the fall of 1955. One, the International Conference on Antibiotics in Agriculture, dealt primarily with the use of antibiotics in increasing the production of animals for food. The other, the third annual Symposium on Antibiotics sponsored by the Food and Drug Administration, reviewed the recent developments concerning the use of antibiotics in medicine; a sound basis for the growing trend of combining antibiotics with various therapeutic agents could not be found.

An excellent article entitled "Folic Acid and Vitamin B_{12} in Medical Practice" by Walter G. Unglaub and Dr. Grace A. Goldsmith, a member of the Council, reviews the present status of these two vitamins. Dr. Unglaub and Dr. Goldsmith emphasized that the inclusion of folic acid in multivitamin preparations is a potentially dangerous practice since it can completely mask the symptoms of pernicious anemia while having no effect upon the development and progression of the neurological complications of this disease.

Dr. Clement A. Smith, another member of the Council, recently reviewed the changes that have occurred in infant feeding. His report, entitled "Current Trends in the Feeding of Infants and Children," delineates for the physician how the knowledge of nutrition has been applied with striking success in the care of infants and children. Dr. Smith noted that many infant diseases that were common a generation ago are practically nonexistent today.

SYMPOSIUMS

On May 21, 1956, the Council on Foods and Nutrition, in conjunction with the Los Angeles County Medical Association and the School of Medicine, University of California (Los Angeles Campus), sponsored its annual symposium at Los Angeles on "The Relation of Proteins and Amino Acids to Nutritional Health." The papers presented will be published individually in THE JOURNAL and then will be combined within one cover. The symposium was attended by representatives of the medical profession, the dietetic profession, the federal Food and Drug Administration, and members of the food industry.

These symposiums have proved so popular that the Council proposes to schedule at least one each year to be held in various sections of the United States. One on fats in human nutrition with particular reference to fats, cholesterol, and atherosclerosis has already been scheduled for New Orleans on March 15, 1957. The Council is pleased to have as co-sponsors of this meeting the Orleans Parish Medical Society, the New Orleans Graduate Medical Assembly, the School of Medicine of Louisiana State University, and the Tulane University Medical School. Tentative arrangements have been made to have one dealing with nutritional requirements during pregnancy at Columbia, Mo., in the fall of 1957.

OTHER COUNCIL ACTIVITIES

At its meetings in October, 1955, and May, 1956, the Council discussed ways and means of cooperating with other organizations in the field of nutrition education. The Nutrition Foundation has indicated that it would like to cooperate with the Council in this area and at the present time details of this endeavor are being worked out. Many other groups have also expressed an interest in having the Council either advise them or actively co-sponsor various nutritional education projects. The National Research Council's Food and Nutrition Board asked the Council to cooperate in the revision of its publication no. 234 entitled "Therapeutic Nutrition." This very popular publication is currently out of print, and because of the great advances in knowledge since its appearance in 1952 the Council agreed to help the Food and Nutrition Board with the revision.

As part of its expanded educational activities the Council participated as an exhibitor at the St. Louis meeting of the American Dietetic Association in October, 1955. The exhibit featured the new program and made many new friends for the Council. A display on popular food fads and fallacies was exhibited at the Washington, D.C., meeting of the American Home Economics Association in June, 1956. The Council also furnished the exhibit that was shown by the Chicago Nutrition Association at the West Side Health Fair held in Chicago in April, 1956. It is anticipated that this activity of the Council will be continued and enlarged as it is able to construct new exhibits on subjects of general nutritional interest, both for the profession and for lay groups. Exhibits sponsored by the Council have been extremely well received and have served to acquaint diverse groups with the work of the Council.

The prestige enjoyed by the Council and the Association can be extremely effective in counteracting misrepresentations about foods and nutrition appearing in the popular press. A number of science writers for newspapers and popular magazines have sought information and assistance from the Council during the past year. Hundreds of inquiries about foods and nutrition were answered by the Council office. These came from physicians, laymen, advertising agencies, better business bureaus, and various trade organizations.

APPRECIATION

The Council wishes to express its sincere appreciation for the cooperation and assistance of the Board of Trustees and of the various departments at Association headquarters. The willing help given by the many consultants called upon by the Council during the past year is also gratefully acknowledged.

Report of the Council on Medical Physics

The new Council on Medical Physics was appointed in the early part of 1956 by the Board of Trustees, in accordance with the actions of the House of Delegates at the December, 1955, meeting in Boston and the June, 1956, meeting in Chicago. The new Council had its organizational meeting on June 15 and 16, 1956.

The purpose of the Council is to encourage an understanding of the actions and rational uses of apparatus and physical methods used in the diagnosis, treatment, and prevention of disease. In order to accomplish this purpose, the Council is initiating a program for the evaluation of evidence in support of the usefulness of various classes of medical apparatus and physical methods of treatment intended for use by the profession.

Another part of the Council program is to encourage research needed to assess the usefulness of various new medical apparatus intended for use by the practitioner. There is need for the development of guides to expected performance and uniform test methods for medical apparatus. The Council has created a special committee from among its members to report its findings to the Council after studying the complexities involved in the development of such a program. The evaluation reports of the Council will contain, where applicable, the actions, uses, contraindications, and appropriate safety warnings regarding the class of apparatus under consideration.

The Council also expects to publish articles for the information of the profession on the use of various classes of apparatus, instruments, and devices in the treatment of specific diseases and in general and special areas of medical practice.

This constitutes a report on the initial phases of the new Council's activities. The Council has formed a committee of its members to study its program and make recommendations regarding other areas which should receive attention in the course of carrying out its program of service to the profession.

Report of the Committee on Research

The Committee on Research has revamped its activities and operating procedures during the past year. First, the Committee dissolved the Subcommittee on Steroids and Hormones as constituted and reorganized two study groups as separate *ad hoc* subcommittees to streamline and consolidate their projects. Second, the Committee formed a new subcommittee to stimulate the preparation and submission of original articles, reviews, and abstracts on research in the basic medical sciences. Third, the Committee introduced several innovations in connection with its report forms and in the routine handling of information to make these functions more practical. The Committee has gone on record as favoring the establishment of a permanent organization the chief function of which would be to award grants to medical schools for the purpose of stimulating research in the basic medical sciences and related fields.

COOPERATIVE INVESTIGATION

The Committee on Research sponsors several collaborative investigations. Its purpose is to assemble information in matters where an investigator has a small series of cases and would hesitate to publish on the subject. In such instances, the Committee will develop a plan of study and with the aid of experts will devise the necessary criteria and forms to acquire this information. The Committee will assemble and collate reported cases and will subject the data to statistical evaluation. A final report in which the facts are set forth will be published for the benefit of the profession.

Steroids and Hormones in Mammary Cancer.—The Cancer Study Group is reviewing data accumulated over a period of several years. It is anticipated that a report discussing the value of steroid and hormone therapy in the treatment of mammary cancer will be available for publication shortly. The group has devised a simplified report form which may be used in connection with the proposed study of the question of the influence of such ablative procedures as oophorectomy, adrenalectomy, and hypophysectomy on the course of mammary cancer.

Pregnancy Complicated by Diabetes Mellitus.—A survey was made of this project during the past year, and it was concluded that the decline in the reporting of cases was associated with the treatment schedule requiring daily injection of hormone or steroid. It was determined that a long-acting substance is available, and arrangements have been made to provide supplies for the study. The members of the study group have approved this substitution of medication. The profession will be apprised of the value of steroid and hormone therapy complicated by diabetes upon completion of the study.

Hypertension and Hypotensive Agents.—During the past year a statement of classification of hypertension was prepared by a selected group of participants who had attended a conference sponsored by the Committee on Research. The Committee on Research did not feel justified in continuing in this field at the present time but felt that the statement was of sufficient merit to warrant wide distribution. It recommended, therefore, that the text be discussed with representatives of the American Heart Association with a view toward publishing it as a joint statement. The preliminary phase of these arrangements is being undertaken, and it is hoped that such a joint statement will be forthcoming in the not too distant future.

Registry of Blood Dyscrasias.—A decrease in the number of case reports during the past year suggested the need for a study of this project. It was determined that the difficulty developed because the report form was too long and too detailed. A new short report form was devised and adopted by the subcommittee. More clinicians and institutions have been enlisted to report in the registry. Effort will be made during the ensuing months to extend and expand the registry. As a corollary, it has been suggested that a series of regional groups be organized to expedite the exchange of information and to facilitate the reporting of cases.

Registry of Adverse Reactions.—The Committee on Research has sponsored several meetings during the past year to consider the possibility of developing a registry for the reporting of adverse reactions to therapeutic agents. The physicians who attended these meetings were unanimous in the opinion that a registry should be launched, that the American Medical Association should sponsor it, and that the Committee on Research should be charged with the responsibility of organizing and operating it. The Committee on Research has appointed one of its members to serve with the secretary in determining what steps are needed to implement this suggestion.

EDUCATIONAL AND INFORMATIONAL PROJECTS

The Committee on Research sponsored a conference during the year dealing with the problem of the steroidal alteration in the management of advanced mammary carcinoma. A preliminary report covering more than 1,000 "accepted" cases was made at this time. The conference considered such subjects as the effect and value of adrenalectomy, oophorectomy, and hypophysectomy in the treatment of mammary cancer. The two-day meeting was well attended and there was considerable discussion during each portion of the program. The minutes of a conference held in Detroit which considered the "Comparison of the Biologic Aspects of Steroids" have been transcribed and should be off the press within a short time.

GRANTS-IN-AID

The Subcommittee on Grants-in-Aid encountered a tremendous task this year in attempting to make an equitable distribution of its allotted funds. This developed because of an unanticipated curtailment of funds from an outside source which drastically reduced the over-all total for this purpose. The reduction placed the subcommittee in the position of having to distribute a smaller amount of money in the face of a mounting number of applications. The secretary reports that a study of the grant-in-aid program for the past three years shows that there has been a steady increase in the number of applications as well as an increase in the total amount of money requested. It is expected that this need will increase, and it is hoped that some provision will be made to meet the future requests for such assistance.

Report of the Committee on Pesticides

This is the seventh annual report of the Committee on Pesticides. Present members of the Committee are: E. W. Constable, Ph.D.; Kenneth P. DuBois, Ph.D.; Chairman, Harvey B. Haag, M.D.; H. L. Haller, Ph.D.; Albert Hartzell, Ph.D.; Arnold J. Lehman, Ph.D., M.D.; S. W. Simmons, Ph.D.; Torald Sollmann, M.D.; and Justus C. Ward, M.Sc. During the past year the following activities were engaged in by the Committee in furtherance of its study program on the health hazards of pesticides.

EDUCATIONAL ACTIVITIES

The series of Committee reports reviewing medical and public health aspects of pesticidal chemicals has been extended to 17 with the publication in The Journal of statements entitled "The Present Status of Chlordane" and "Fatal Chlordane Poisoning." A report of a study of effects of DDT in human volunteers is presently awaiting publication.

ANNUAL MEETING

The Committee held its annual meeting on March 28, 1956, at the headquarters of the American Medical Association. Current problems affecting the use of agricultural chemicals and pesticides used in the home were discussed. Certain of the more important topics considered and actions taken by the Committee are set forth.

The problem of impurities in pesticides which produce variations in their toxicity was the first topic considered. It was agreed that when variations in the toxicity due to highly toxic impurities occur frequently controls should be instituted to check this at the manufacturing level. Whether bioassay was necessary in addition to chemical analysis in product control depends on whether chemical techniques for the determination of toxic impurities had become standardized. It was pointed out that each pesticidal must be dealt with individually and that the problem cannot be generalized.

The place of toxicology in the medical curriculum was reviewed by an outside specialist. It was the discussant's opinion that toxicology should be separated from pharmacology in the medical curriculum. He based this contention on the fact that the number of poisonous substances used in household articles are increasing rapidly and all too often the physician is ignorant of a product's potential toxicity. The establishment of the Poison Control Center in Chicago indicated that physicians were inadequately trained in school in this subject. He pointed out that in the field of forensic medicine, Europe is and has been far ahead of the United States. If a separate department of forensic medicine could be established, more time should be spent on toxicology within the medical curriculum. The discussant advocated that toxicology be separated from pharmacology and biochemistry, and that toxicology be given greater consideration in courses already established. The ensuing discussion brought out the point that courses in toxicology never covered practical treatment details, but dealt rather with the general principles and demonstrations of substances in which toxicology played a part. While poison control centers provided a service where information on the composition of new compounds could be obtained, knowledge of the composition of all products was almost impossible since there are about one-quarter of a million chemical products on the market. It was concluded that more adequate informative labeling, education of the public, and emphasis in the medical curriculum would increase awareness of poisons. Suggestions were made that Committee members make themselves available to medical schools to present this problem and point out that it can make information available.

Reports of severe poisoning of public health workers applying dieldrin sprays in Venezuela were reported. Although the spray teams were provided with adequate equipment, it was found that workers were often careless about exposing themselves to dieldrin by removing their respirators or neglecting to change clothing. It was found that those poisoned had been exposed to concentrations of dieldrin higher than are usually encountered. A movie was presented which showed reactions of animals to dieldrin poisoning: weight and appetite loss, possible blindness, muscle incoordination, and convulsions. Experiments have demonstrated that use of barbiturates may be of some benefit in dieldrin poisoning. It was brought out that transient changes in personality in man and dogs had been noticed. It was proposed that antiepileptic drugs be tried in future studies of dieldrin poisoning.

The toxicology of nicotine was next considered. The minimum death rate for nicotine was estimated at around 10-12 per year. The fatal dose of nicotine ranges between 60-100 mg., which is the same amount absorbed by an average smoker during a day. Epidemics of acute nicotine poisoning usually occur when plants are improperly treated or harvested. A recent series of food poisoning occurred in California when a commercial preparation was used on Texas mustard greens. The waxy leaf of the greens induced alkaloid to remain in the plant. No specific antidote for nicotine poisoning is available. The value of supportive measures, such as gastric lavage, prompt removal from the skin, and use of an anticonvulsant drug was reemphasized.

The neurological effects of organic phosphorus insecticides were reviewed by an investigator active in the study of this problem. Jamaica Ginger containing triethylcresolphosphate produced paralysis in people who drank this beverage during the prohibition era. Experiments have been carried out with certain organic phosphorus insecticides (malathion, EPN) on chickens with the production of generally similar type of paralysis. No information is available to explain why some compounds produce paralysis and others do not, although the production of paralysis appears to be related to dosage.

Other topics considered at the meeting included factors involved in setting tolerances under the Miller Amendment to the FDC Act, the advisability of using partially volatile insecticides in termite control of new housing, and background data on new developments in pesticides.

SERVICE ACTIVITIES

The Committee on Pesticides collaborated with other groups and organizations during the past year on problems of mutual concern. It continues to cooperate with the Interdepartmental Committee on Pest Control. Through the secretary it also maintained its representation on the Sectional Committee on Common Names for Pest Control Chemicals of the American Standards Association, and on the Liaison Panel of Food Protection Committee of the National Research Council. During the past year this Committee has participated in the selection of eight generic names for new pesticides.

The Committee was requested by the Federal Housing Administration to participate in a study of the safety of proposed procedures for termite control in wooden structures. A general statement outlining the Committee position was provided the Committee representative on the study panel.

At the request of the British Ministry of Agriculture, representative state and federal legislation on pesticides and pesticide residues in foods were compiled by members of the Committee on Pesticides. The compilation was obtained with the assistance of various state regulatory agencies and trade associations.

During the past year the Committee was asked by physicians and private agencies to consider and render opinion on a variety of medicoeconomic problems involving the hazardous potentialities of pesticides. Requests for information and assistance is typified by the following instance involving the sale of an unregistered insecticide. This problem was brought to the attention of the Committee by a Texas physician following a frustrating attempt to get information locally on the composition of a product suspected of causing injury. No information about a door-to-door distributed insecticide could be obtained from local health and regulatory agencies or the Better Business Bureau. A report was made to the Committee on Pesticides, one of whose members analyzed the product. The Committee brought to the attention of the state medical board and appropriate federal agencies the health problem inherent in this and similar types of unregistered insecticides.

Report of the Committee on Toxicology

This is the second annual report of the Committee on Toxicology. During the past year the Committee expanded its educational and research program for the study of accidental poisoning. The following is a resumé of its more important activities and accomplishments.

EDUCATIONAL ACTIVITIES

The series of Committee reports has been extended to eight with the publication of a status report and three editorials. A report on "The Problem of Accidental Poisoning in Children as It Exists Today" calls attention to the increasing need for recognizing the hazards of children ingesting drugs and common household chemicals and presents the means for solving the problem. Editorials on lye and kerosene poisoning stressed the importance of these agents as common causes of childhood injury. A third editorial stressed the problem of prevention in accidental poisoning. A fourth status report on the health problems of household chemicals is presently under consideration. This was one of several papers presented at the Symposium on the Health Hazards of Household Chemicals co-sponsored by the Committee at the annual meeting of the American Association for the Advancement of Science.

INVESTIGATIVE AND RESEARCH ACTIVITIES

The Committee has accepted an invitation to participate with the American Academy of Pediatrics and the American Public Health Association in a national cooperative project with poison centers and certain medical schools and major medical centers in a clinical study of the treatment of poisoning following ingestion of kerosene and other petroleum distillates. Over 25 poison centers and affiliated hospitals and medical centers have agreed to participate in the program. Arrangements have been made with the research laboratories of a leading petroleum company to study means for determining blood levels of absorbed petroleum distillates. A grant-in-aid from the American Medical Association has been obtained for a Committee investigator to study anti-inflammatory agents in the treatment of kerosene poisoning.

Committee on Toxicology participation in the kerosene clinical study is a further extension of its cooperative relationship with the American Academy of Pediatrics and the American Public Health Association. Previously it cooperated with the Academy in spearheading the movement to provide precautionary labeling and safer packaging of children's aspirin. It also is cooperating with the Academy and the American Public Health Association in the formation of a national clearing house for poison control centers. A report to the medical profession on the status of poison control centers is presently being formulated.

The Committee has taken the initiative to arrange for an exploratory meeting of interested groups with the medical advisors to the petroleum industry. Persons with a special knowledge of the medical problems of this class of chemicals have been invited to participate in a fall meeting.

SERVICE ACTIVITIES

The Committee on Toxicology has collaborated with other groups and organizations during the past year. A joint meeting of representatives of the Precautionary Labeling Committee, Chemical Specialties Manufacturers Association, and the Committee on Toxicology has been scheduled for Sept. 11, 1956. The pending conference intends to explore solutions to problems involved in use of household chemical products. Current problems include precautionary labeling, regulations for poisons not under legal control, industry cooperation with poison centers, education of the public on the safe handling and storage of products containing potentially harmful chemicals, and cooperation between health and regulatory agencies and industry.

The Committee is also participating in the pilot study of the Research and Reference Branch of the United States Food and Drug Administration on toxic reactions to drugs in select hospitals throughout the country. The current study, which is being conducted with the cooperation of medical record librarians, is intended to determine the frequency, extent, and duration of injury from drugs among hospital patients.

Through the secretary, representation is maintained on the Committee of the Chicago Poison Center, the Steering Committee for a National Clearing House for Poison Centers, and the American Standard Association Z66 Committee on Hazards to Children. The secretary also participated in the program of the Public Health Forum of Long Island University's College of Pharmacy, 60th Anniversary of the Association of Food and Drug Officials, Symposium on Childhood Poisoning, mid-year conference of the American College of Apothecaries, and the annual meeting of the Maine Pharmaceutical Association.

Report of the Committee on Cosmetics

This is the seventh annual report of the Committee on Cosmetics. During the past year the Committee has continued its essential task of accumulating, preparing, and disseminating educational material. It has aimed to promote better understanding of the functions, maintenance, and significance of the normal skin, with special reference to the role of cosmetics and allied preparations; to emphasize the serious psychological implications of those conditions characterized by temporary or permanent skin disfigurement; and to stimulate increased cooperation between the health profession and the toilet goods industry in providing the public with safe, effective products promoted with reasonable informative claims.

The Committee disseminates educational information mainly through reports and articles published under its auspices in THE JOURNAL and in *Today's Health*, seminars, and its extensive inquiry service. A Committee report may represent the cooperative efforts of all Committee members, in which event it is published as a report of the Committee, or a report may be prepared by an individual scientist, in some instances a nonmember, at the request of the Committee. This report is then reviewed by the Committee and, if acceptable to all, is published as a report to the Committee. In the past year, the following reports have been published in THE JOURNAL: "Acne Vulgaris" by Dr. Frederick D. Malkinson; "Treatment of Acne Scars by Dermabrasion" by Drs. Herbert Rattner and Charles R. Rein; "Ways and Means to Safe Sunbathing"; and "The Effects of the Sun on the Skin" by Dr. Beatrice M. Kesten. At present, there is under preparation the first of a series of reports on hirsutism, in which emphasis will be placed on temporary or permanent corrective measures for the cosmetic disfigurement of this condition. For the fifth year, a monthly series of educational articles on skin care and cosmetics was published in *Today's Health*. Reprints of published reports and articles are available on request.

The newest educational activity of the Committee is its sponsorship of a series of symposiums. The first symposium on the significance of cosmetics in medical practice was presented at the annual meeting of the American Medical Association in Chicago in June, 1956. Attendance was near 300, with both physicians and industry scientists equally represented.

The second symposium will be held during the annual meeting of the American Association for the Advancement of Science, Dec. 27, 1956, in New York City. The tentative program includes papers on axillary odor and its control, skin cleansing, cosmetic usefulness of pigment forming drugs, and toxicity of cosmetic ingredients. Individual Committee members have participated in a number of programs of cosmetic industry-sponsored scientific meetings. The Committee's secretary has, during the past year, addressed American Medical Association Woman's Auxiliary groups, the Maine Pharmaceutical Association, and the Cosmetic Career Women, a group whose membership is limited to women executives in the cosmetic industry.

For the second consecutive year, a Committee member has been singularly honored by the cosmetic industry. Dr. Irvin Blank was given an award of $250 and a scroll for the most original paper presented before the Scientific Section of the Toilet Goods Association during 1955. Dr. Blank's paper entitled "Mechanism of Agents for the Relief of Dry Skin" is considered to be one of the most important contributions to cosmetic science. A year previous, Dr. Stephen Rothman, Committee chairman, received the first $1,000 award of the Society of Cosmetic Chemists in recognition of his book "Physiology and Biochemistry of the Skin."

This year has been further characterized by a greater interest by dermatologists of other countries in the Committee's activities. The president of the International Congress of Dermatology, to be held in Stockholm, Sweden, has requested that the Committee participate in that program. Reprints of Committee reports will be made available for distribution, and plans are under way for presentation of a paper on the objectives and functions of the Committee on Cosmetics. Several Committee members have a significant role in the organization and presentation of the program of the Congress. At the request of the editor, an article on the Committee's activities is being written for a German medical publication, *Journal Furmedizinische Kosmetik.*

As in other years, the Committee office has continued to serve as an information center and advisory board for groups and individuals whose activities influence the flow of information on cosmetics to the public. These include official groups of the allied health professions, better business bureaus, government agencies, writers, radio and television networks, newspapers, and magazines.

The Committee is particularly indebted to the many consultants who have so willingly offered and rendered assistance in special problems during the past year.

Report of the Chemical Laboratory

The study and development of a new program for the American Medical Association Chemical Laboratory was undertaken during the period covered by this report July 1, 1955, to June 30, 1956. The scope of the work to be done in the future by the Chemical Laboratory was outlined, then planned in considerable detail for the consideration of the Committee on Scientific Councils. In the preparation of these plans, the particulars were developed through decisions reached after correspondence and discussion with representatives of many pharmaceutical firms, the Food and Drug Administration, the American Pharmaceutical Association, and several interested departments and councils at American Medical Association headquarters. The plans were revised, amended, and finally presented to the Committee on Scientific Councils for its final consideration. The Committee made its recommendations to the Board of Trustees, which in turn approved the proposed program of the Chemical Laboratory. Several phases of the new program were initiated during this time—in particular, the work on tests and standards of new drugs.

During this period there was an opportunity to do additional laboratory work on problems of medical interest. A comparative study of available "in vitro" methods for the determination of antacid efficiency was completed and published. Additional work on methods for determining the amounts of medicament released with time from sustained release medication was carried out. A comparative study of methods for the determination of the hexachlorophene content of soaps was completed. Work has been undertaken to develop methods of determining saccharin and sucaryl where they occur together in food and drink. Human gastric juice and several simulated or artificial juices including the official U. S. P. and N. F. juices and that developed in our own laboratory were compared as mediums for testing antacids and enteric coatings. Several commercial enteric-coated products were tested for resistance to the acidity of simulated gastric mediums and simulated intestinal juice. Literature reviews and statistical analysis of available data have been completed as a basis for a proposed program related to the uses and limitations of spectrophotometers and flame photometers as analytical instruments in drug assay. A survey was conducted on the composition of certain suntan preparations on the market. An infrared spectrophotometer was obtained and is now being used for both qualitative and quantitative analytical work. A register of both infrared and ultraviolet absorption curves of drugs has been begun and will be an important source of reference on identification, purity, and characterization of drugs.

At the request of other departments within the American Medical Association, several laboratory problems were undertaken. Analyses were carried out on an antistatic agent, several claimed cancer cures, a deodorant, a new type of cigarette filter-holder, a chloral hydrate preparation, a nitroglycerin medication, and several clinical chemical testing devices. An analysis of low-sodium milk is near completion. A comparative study was made on the difference in light transmittancy of coated and uncoated lenses. Work was initiated and completed on a collaborative laboratory project conducted by the Food and Drug Administration on Rauwolfia assays.

The Laboratory continues to serve in an advisory capacity to other departments such as the Council on Pharmacy and Chemistry, Council on Foods and Nutrition, Bureau of Investigation, Council on Medical Physics, Committee on Cosmetics, Committee on Pesticides, Editorial Department, Library, and Advertising Department. These services are concerned with chemical nomenclature and information, drawings of structural formulas, indexing chemical and pharmaceutical names, checking chemical data and reactions to appear in articles and correspondence, reviewing chemical articles proposed for publication in THE JOURNAL, requests for data on composition of products, book reviews for THE JOURNAL, and laboratory work to check claims and data.

There has been considerable correspondence with physicians in reply to questions of a chemical nature and in a few instances analyses were carried out on problems of general medical interest at the request of individual physicians. Individual members of the laboratory staff have served as referees for papers to be published by outside technical journals.

Report of the Bureau of Investigation

During the year ended June 30, 1956, the Bureau of Investigation accelerated its program of personal appearances in talks, lectures, radio and television presentations, and exhibits. There were 69 appearances before organizations and groups, and on television and radio programs. Included were talks before medical societies, woman's auxiliaries, university groups in Colorado, Illinois, Indiana, Oklahoma, Virginia, and Wisconsin, service clubs, health groups, women's clubs, church groups, and one luncheon talk before a local bar association meeting in Ohio. The Director spoke on cancer quackery at several district meetings of the Illinois division of the American Cancer Society and at the annual meeting of the Iowa division, and one district meeting in Michigan. Television and radio presentations included one network and several local programs.

In cooperation with the Bureau of Exhibits, exhibits were manned at the South Carolina State Fair at Columbia, the Eastern Carolina Agricultural Fair at Florence, S. C., the American Medical Association Clinical Meeting at Boston, the "Cavalcade of Health" at Los Angeles, the Cleveland Health Museum at Cleveland, the "Akron Health Days" at Akron, Ohio, the Michigan Clinical Institute at Detroit, and the inspirational meeting at Tyronza, Ark., of the First, Second, and Third Districts of the Arkansas Medical Society, sponsored by Dr. L. H. McDaniel of Tyronza.

The Director attended two meetings of the Committee on Cancer Diagnosis and Therapy of the National Research Council, as a representative of the Association as a sponsor. The Committee studies and evaluates unestablished cancer treatments and diagnostic techniques. He also attended meetings of the American Cancer Society in New York and Detroit, as a member of the Committee on New and Unestablished Cancer Treatments, and attended the National Meeting to Commemorate the 50th Anniversary of the Food and Drug Laws in Washington.

The Bureau submitted one article for THE JOURNAL on the subject of a medical impostor and an editorial, which were published. In its day-to-day activities, approximately 3,800 inquiries were received on the subjects with which the Bureau deals. The largest single number came from physicians, followed closely by letters from laymen asking for information on subjects with which the Bureau deals. Government agencies, students and teachers, better business bureaus, and newspapers and magazines also used Bureau facilities for their own information.

During the last several years the principal subject of interest was cancer "cures" and treatments. More than 800 inquiries were received on this category alone. The second largest group inquired about were the cultists. This resulted partly from the fact that in two southeastern states the state medical societies were successful in sponsoring legislation to repeal laws which provided for separate naturopathic examining boards. The legislation, incidentally, also provided for revocation of licenses previously issued by such now defunct naturopathic examining boards. The legislative action was challenged by the naturopaths in South Carolina. The Supreme Court of South Carolina, however, has since upheld the action of the legislature as a proper exercise of state police powers.

During the year the Bureau, in cooperation with the Public Relations Department, published a leaflet on "Mechanical Quackery." This is a most popular propaganda piece, and a second printing has been necessitated. More than 300 inquiries were received on advertising institutions—the commercial establishments prevalent particularly in western Missouri, which "specialize" in piles, prostatism, rheumatism, and hernia. These are, for the most part, corporations organized for profit, and the situation involves the corporate practice of medicine in its worst form.

Considerable lay and professional interest was shown in an itinerant "faith healer" who has not only a magazine but also a filmed television presentation shown weekly on more than 200 television stations in this country. Added to that, he has a good many radio outlets.

There were also a large number of inquiries on medical impostors, vitamin and mineral products, and rheumatism "cures," and the seasonal (spring and summer) interest in the flamboyantly advertised "new," "amazing," "scientific" vehicles for the treatment of obesity continued as in years gone by. These involve not only the reducing salons but also products advertised widely to the laity as short-cuts to a slim, trim figure. The trend in this field seems to be toward the vibrating tables and the personal attention to be obtained at the well-advertised and "plush" reducing salons which have proved to be such great money-makers for the astute promoters thereof.

Of particular interest, also, was an abortive effort in December, 1955, and June, 1956, on the part of a physician, the secretary of a board of examiners in an eastern state, to admit to medical licensure approximately 80 unqualified persons with either naturopathic or chiropractic background. This matter is now pending in the courts by injunctive process.

As in the past, the Bureau has functioned as a clearing house of information on the subjects which comprise the unscientific side of medicine, particularly nostrums, quacks, faddists, cultists, and impostors. In doing its work, the Bureau relies upon, and appreciates sincerely, the cooperation of state and local medical societies, state medical boards, health departments, and federal agencies having the enforcement of the laws which touch upon these subjects. Particular acknowledgment is made at this time to the fine work of the National Better Business Bureau in the investigation of certain "patent medicines" which are not as represented, and the business dealings of their promoters. The Bureau obtains scientific data, and in some instances chemical evaluations of products, from the Councils and Laboratory of the Division of Councils of Therapy and Research.

Report of the Council on Industrial Health

The Council program during the period covered by this report, July 1, 1955, to June 30, 1956, received a severe blow due to the untimely death of the secretary, Dr. Carl M. Peterson, in an airplane crash in September, 1955. During the remainder of the period, Mr. Clark D. Bridges served as acting secretary. Dr. William P. Shepard, chairman of the Council, gave freely of his time and invaluable assistance in conducting Council affairs during this period. Under the leadership of the chairman and with the assistance of the members of the Council, a considerable number of physicians were considered and interviewed in the search for a new secretary. Dr. B. Dixon Holland was selected, assuming the post on July 16, 1956.

Council Meetings and Congress on Industrial Health

Three meetings of the Council were held during this period, namely, in Houston, Texas, in September, in Detroit in January, and in Philadelphia in April.

The Houston meeting was held in conjunction with the eighth annual Houston Industrial Health Conference to provide recognition of this Conference by an important national group and to promote industrial health and improve its standing in this growing industrial area. Council members also participated in the Conference program.

At the Detroit Council meeting, conferences designed to improve rapport and cooperative action were held with the chairmen of state medical society committees on industrial health and with the officers and directors of the Industrial Medical Association.

The Detroit meeting was followed by the 16th annual Congress on Industrial Health, a well-attended and very successful series of open meetings on "Occupational Medicine in Industrial Relations," "Medicine's Responsibilities in the Automotive Age" (in cooperation with the American Medical Association Committee on Medical Aspects of Automobile Injuries and Deaths), and "Absence from Work due to Nonoccupational Illness and Disease" (sponsored by the Joint Committee on Medical Care for Industrial Workers of this Council and the Council on Medical Service).

Taking advantage of the usual attendance of many of the Council members at the Industrial Medical Association's annual convention, the Council held its third meeting of the period in Philadelphia in April.

Until recently, the Council on Industrial Health has met on an average of twice a year. A minimum of three meetings a year, and possibly four, are now contemplated due to the increase in the number and complexity of subjects requiring attention.

Committee Activities

Shortage of staff personnel forced partial curtailment of standing committee activity; however, many subcommittees continued to meet and pursue work on their assignments.

COMMITTEE ON INTERPROFESSIONAL RELATIONS

Subcommittee on Standing Orders for Industrial Nurses.—This project was completed as "Guiding Principles and Procedures for Industrial Nurses," published in The Journal of Nov. 5, 1955, reprinted in several other medical and nursing journals and in special pamphlet form. This is very evidently a sorely needed document, as over 15,000 copies have been ordered from the Association. A second printing has been necessary.

Subcommittee on Plant Hygiene Studies.—This project is virtually complete, and a brochure is in the final editing stage. This emphasizes the importance of inspections of the industrial environment by physicians and includes a primer on how to make the survey and what to look for.

Committee on Medical Education and Training

Attention was given to the need for added special training of physicians wishing to qualify for examination by the American Board of Preventive Medicine for certification in occupational medicine. This has culminated in plans for a meeting of preventive and industrial medical educators and leaders in Chicago in September to develop special courses to be offered by the summer of 1957.

Committee on Public Services

Subcommittee on Workmen's Compensation.—Last fall, after many months of intensive study and preparation, the Council submitted two reports on workmen's compensation to the Board of Trustees. One report, entitled "Medical Relations in Workmen's Compensation," was designed to serve as a guide for the evaluation and implementation of a progressive program by the medical profession. The other report dealt specifically with the subject of physician selection under workmen's compensation laws. The essence of the latter report was the recommendation that appropriate official medical organizations in each workmen's compensation jurisdiction examine and, where necessary, seek adoption of statutory provisions to the end that all patients subject to these laws have the option of accepting the services of a physician designated by the employer or of selecting an attending physician from a register of all other physicians in the community who are willing and qualified to perform the essential services. The Council was indeed gratified by the approval of these reports by the Board of Trustees and their subsequent adoption by the House of Delegates last December.

Much favorable comment followed the publication of these statements. While there are definite indications that in some areas the medical profession has undertaken to implement these recommendations, the Council believes that more widespread and intensive thought and activity by the medical profession is essential to bring about long overdue improvements in these programs.

The value of these reports was immediately apparent when the U. S. Department of Labor asked for comments on its "Discussion Draft of Proposed Model Workmen's Compensation Law," on which the Council was asked to report to the Board of Trustees. Guided by the policies set forth in the two reports, the Council, with the able assistance of its committee and consultants on workmen's compensation, prepared a lengthy series of constructive remarks confined to those aspects of the draft of interest and concern to the medical profession. In April the Council's report was accepted by the Board of Trustees and forwarded to the U. S. Department of Labor. At the same time, the Board authorized the Council to continue to cooperate in further activities connected with the preparation of the model law.

In addition to these activities, the Council has continued to fulfill as many requests as possible by state medical societies and other professional organizations for assistance in the development of improved medical care programs for the occupationally disabled.

Joint Committee on Medical Care for Industrial Workers.—This is a Joint Committee of the Councils on Industrial Health and Medical Service. Three meetings were held by the Committee during the past year. They were primarily concerned with two major activities: the United Mine Workers Welfare and Retirement Fund, and work absence due to nonoccupational disability.

A unique feature of the fourth Conference on Medical Care in the Bituminous Coal Mine Area, which was held in Charleston, W. Va., on May 6, 1956, was an extensive two-day field trip to the Beckley and Bluefield coal mine areas by a group of fifty doctors. Delegates from various state medical societies and the United Mine Workers Welfare and Retirement Fund had an opportunity of securing on-the-scene information about working and housing conditions and medical care provided to miners and their families from hospital administrators and other medical personnel. Two meetings with local medical societies provided for a further exchange of information.

The committee realized one of its major goals on Jan. 23, 1956, when it held a one-day conference devoted to work absence due to nonoccupational disability in Detroit as part of the Congress on Industrial Health. Over 500 physicians, including general practitioners and medical directors, as well as management representatives and other medical personnel, heard four distinguished panels discuss various aspects of this problem. To the committee's knowledge, this was the first time that a project of this scope had ever been undertaken by the Association, dealing with the broad ramifications of this problem. Over twenty speakers talked on a wide range of topics dealing with job absence, and answered scores of questions from the audience.

The joint committee issued the following publications during the past year: (1) "Company Medical Programs and Work Absence;" (2) "A Syllabus on Work Absence;" (3) "Management Health Centers;" (4) "Guiding Principles for Management and Union Health Centers;" and (5) "Report of the Fourth Conference on Medical Care in the Bituminous Coal Mine Area."

The full report of the joint committee is presented in the annual report of the Council on Medical Service.

COMMITTEE ON SCIENTIFIC DEVELOPMENT

Subcommittee on Physical Examinations in Industry.—This subcommittee's project has been completed as "Guiding Principles of Medical Examinations in Industry," published in THE JOURNAL, July 7, 1956, and reprinted in pamphlet form. Orders for large quantities are being received.

Subcommittee on Occupational Cancer.—Two major projects are now in draft stage: (1) "Occupational and Environmental Cancer of the Skin" and (2) "Means of Determining Inordinate Risks to Cancer." The House of Delegates has approved the resolution of this committee regarding the need for continuation and expansion of vital statistics relating to neoplastic diseases.

Subcommittee on Occupational Dermatoses.—A series of six related papers are in various stages of completion. When published, they will constitute a comprehensive primer on this important industrial disease. Titles in the series are: (1) "Introduction—from the Dermatologist's Viewpoint" and "Introduction—from the Medical Director's Viewpoint;" (2) "Causes and Predisposing Factors;" (3) "Clinical Types of Industrial Dermatoses;" (4) "Prevention of Industrial Dermatoses;" (5) "Medicolegal Aspects;" and (6) "Prolonged and Recurrent Dermatitis."

Subcommittee on Estimation of Loss of Visual Efficiency.—This project was completed and published in the A. M. A. *Archives of Ophthalmology*, September, 1955, and, with a glossary added, in the A. M. A. *Archives of Industrial Health*, October, 1955. There has been a heavy demand for this reprint.

MISCELLANEOUS COUNCIL ACTIVITIES AND PLANS

"Impact of the Atomic Energy Industry on Community Health" was the topic of a series of sessions at the Council's 1955 Congress on Industrial Health in Washington, D. C. The proceedings were printed intact in the May, 1956, A. M. A. *Archives of Industrial Health*, and are now ready in pamphlet form to fill a timely and growing need.

Liaison has been maintained on the industrial noise and hearing-loss problem with the American Academy of Ophthalmology and Otolaryngology. It is hoped the Council and the Academy can cooperate in the development of acceptable procedures and standards for measuring accurately hearing loss due to industrial noise. This will be a picking up of the activity previously carried on in this field by what is now the Council on Medical Physics.

Liaison has been maintained with the American Public Health Association and American Society of Mechanical Engineers on the problem of air pollution.

There is a continuing demand for the Council's exhibit on "Hazards of Solvents—At Home and on the Job." It was shown at several local and national medical meetings as well as to other groups. The exhibit won second prize among scientific exhibits at the April meeting of the Industrial Medical Association. The Argonne National Laboratories plan to use it for five weeks for personnel education.

Action was taken toward solution of the Council's need for an effective Committee on Industrial Ophthalmology, functioning under its own aegis, and approval was given by the Board of Trustees.

The Council's general liaison activities were somewhat curtailed, but constructive contact was maintained with certain groups, such as

President's Committee on Employment of the Physically Handicapped
National Safety Council
Industrial Medical Association
American Association of Industrial Nurses
American Nurses Association
Industrial Hygiene Foundation
American Industrial Hygiene Association
American Heart Association

Overlapping of interests and areas of activity in the field of health conservation are common to most of the medical and paramedical groups. Maintaining a cooperative and friendly but watchful relationship has paid dividends. The Council is regarded as a guardian of medical principles and a spokesman for the American Medical Association. Its advice and counsel are sought and well received.

Plans for the future include resumption and intensification of standing committee activities. It is hoped that a Committee on Health Education in Industry can be formed and start functioning, as there has long been a great need for such activity. This would be in cooperation with the Bureau of Health Education.

The next Congress on Industrial Health is scheduled for Los Angeles, Feb. 4 to 6, 1957. The program is nearly complete, and session topics are: "A Complete Industrial Vision Program," "The Management of Burns," "Herbicides and Pesticides," and "Developments in the Control of Industrial Noise and Hearing Loss."

The employment of persons with neurological disorders requires rather thorough investigation to develop techniques for evaluating their employment potentialities and suitably placing them in jobs. Advantage is taken of advances in medicine which make more of these individuals employable in industry. Exploratory discussions have been held, and it is planned to establish in the very near future a Subcommittee on Neurological Disorders in Industry, having as its objectives the discussion of current problems, compilation of available information on the various special phases of the subject, a full-scale conference or symposium, and publication of pertinent papers.

As heart disease assumes ever greater importance in the general population, it becomes equally significant as a factor in industry. How do the various types of cardiacs compare with one another with respect to employment potentialities? What are the best techniques for evaluating such potentialities? When is heart disease a legitimate claim under workmen's compensation? The problem grows more acute, and considerable resolution is needed if cardiac cripples are to have gainful employment. The Council is co-sponsoring a conference next May in Milwaukee on "Work and the Heart." Preliminary discussions have been held with the American Heart Association, particularly its Committee on Trauma. To implement these current activities and continue them as needed, a Committee on Heart Disease in Industry is probably needed.

It is hoped that during the fiscal year 1957 work can begin on the development of a planned series of scientific exhibits designed for education of the general practitioner on facets of industrial medicine which may be involved in his practice.

Report of the Council on National Defense

This report covers the activities of the Council on National Defense beginning July 1, 1955, and ending June 30, 1956.

MEETING AND ADMINISTRATIVE ACTIONS

In this annual reporting period, the Council and its committees held two regular meetings. On the first day of these two-day meetings, each committee meets separately, followed by a meeting of the full Council on the second day. Meetings were held in Washington, D. C., on Oct. 26 and 27, 1955, and in Chicago on April 7 and 8, 1956.

Each succeeding year has seen an increase in the importance of participation by the medical profession in military medical affairs and civil defense matters. We have witnessed significant expanded activities in both fields for the past few years, and today it is essential for the Council to maintain close and constant liaison with a number of federal departments and agencies in order to keep currently posted and advised of changing developments in these two areas. The Council, therefore, decided to hold one of its two yearly meetings in Washington, D. C., and to schedule it during week days rather than on a week-end, the time usually scheduled for a regular meeting. It was felt that such a change would be decidedly more desirable and convenient for representatives of the governmental departments and agencies. The first such meeting was held on Oct. 26 and 27, 1955, and it was most successful and well received by members and invited guests. In spite of certain disadvantages to members in attending week-day meetings, the Council will continue to hold a yearly meeting in Washington, D. C. for the purpose of considering and discussing with federal representatives items of mutual concern and interest.

The executive committee of the Council met during the Association's 1955 Boston Clinical Meeting and its 1956 Annual Meeting in Chicago. In addition, Council and committee members, including the secretary of the Council, have participated in a number of meetings with federal agencies, medical societies, and various allied medical and health groups.

The creation by the Board of Trustees early in 1955 of two permanent committees of the Council has assisted greatly in a more orderly and effective discharge of work by the Council. Under direction of the Council, a Committee on Military Medical Affairs and a Committee on Civil Defense assist, within their respective areas, with the responsibilities and programs administered and developed by the Council. With the exception of the chairman, each Council member serves as a member of one of the two committees. Each committee chairman is also a Council member. Both committees have seven members. The Committee on Civil Defense has three non-council members and the Committee on Military Medical Affairs has two such members. Upon recommendation of the Council in May, 1956, the Board of Trustees established the terms of service of Committee members who are not Council members on a three-year rotating basis.

In December, 1955, Dr. Carroll P. Hungate was reelected to Council membership by the Board for a five-year term ending in December, 1960, and Dr. Walter B. Martin was elected for a similar term to succeed Dr. Arthur A. Brindley. At the same time, the Board named Dr. Max L. Lichter to membership on the Committee on Civil Defense. Dr. Hugh H. Hussey Jr. was designated by the Board in June, 1956, as its liaison representative to the Council to replace Dr. F. J. L. Blasingame.

Military Medical Activities

At the first Washington, D. C. meeting of the Committee on Military Medical Affairs, a number of high-ranking federal government officials attended and participated. In attendance, among others, were Dr. Frank B. Berry, Assistant Secretary of Defense (Health and Medical); Major Gen. Silas B. Hays, Surgeon General, U. S. Army; Major Gen. Dan C. Ogle, Surgeon General, U. S. Air Force; Rear Adm. Bruce E. Bradley, Deputy Surgeon General, U. S. Navy; Major General Lewis B. Hershey, Director, Selective Service System; and Dr. Leonard A. Scheele, Surgeon General, U. S. Public Health Service. Committee and Council members also met with Dr. Arthur S. Fleming, Director, Office of Defense Mobilization, Executive Office of the President, in his offices from 5 to 6 p. m. Dr. Fleming discussed with the group the several possibilities of attack on the United States and the recent directive of the President providing for the "trigger orders" for the Director of the Office of Defense Mobilization to utilize should this country become engaged in hostilities. Similar plans were discussed which would meet the medical and health needs of this country under various conditions of hostility.

This meeting, as well as the subsequent committee meeting on April 7, 1956, resulted in a full discussion of the many problems of military medical services and provided an opportunity for the military representatives to outline some of their specific problems and to further acquaint the committee on the over-all subject. Following these meetings, the committee suggested, and the Council approved, status reports to the Board of Trustees, including a number of recommendations pertinent to military medical items. A brief review of some of these subjects is herewith included:

Medical and Dental Officer Career Incentive Program.—The Council's last annual report recognized the importance and outlined some of the efforts of the Council and the Association in the past ten years for the development of a strong and attractive military medical corps. For a number of years, the Council observed with great concern the alarming physician loss rate of the military medical services. It recognized that this trend had to be reversed to preserve, strengthen, and maintain the prestige and very existence of military medicine. In May, 1955, it suggested action and the Board of Trustees brought the critical problem, with recommendations thereon, to the attention of the President of the United States.

In June, 1955, the Secretary of Defense established a special inter-service Task Force to explore all phases of the problem and present recommendations for its solution. As a result of these studies, the most frequent reasons for lack of interest in a military medical career were (1) inadequate pay, (2) lack of promotion opportunities, (3) frequent moves and greater separation from families, (4) inadequate housing, and (5) a general dislike of military life, or a preference for civilian-type life. The Council reviewed the suggestions and legislative recommendations of the Department of Defense on this subject at its October, 1955, meeting. In November, 1955, it advised the Board of Trustees of the proposed career incentive program. It also commended the Department of Defense for its serious consideration and constructive proposals and reported that the Council was favorably impressed with the essential features of the program, recommending Association support of the general principles as outlined.

During hearings on the career incentive bill, early in 1956 before Senate and House Armed Services Committees, witnesses on behalf of the Association testified in support of the legislation as a "step in the right direction." However, the Association witnesses pointed out that the bill did not go far enough, since it provided only "token increases" in pay and rank. In its testimony, the American Medical Association recommended that (1) the initial increase in special pay be made available after two years of service, (2) an increase be made in the amount of additional special pay provided in the bill, and (3) sufficient latitude be given to permit the payment of the increased special pay to those physicians whose professional qualifications were such that their initial appointment would be in the grade of major or lieutenant colonel, notwithstanding the fact that such officers would not have served the requisite number of years to qualify for the increase otherwise. The career incentive legislation was enacted as Public Law 497, 84th Congress, April 30, 1956. As finally approved, it did include the American Medical Association recommendation for an increase in pay at the end of two years rather than after three years as recommended and passed by the House. In addition to the $100 per month equalization pay, medical officers, under the law, receive an additional increase in pay of $50 at the end of two years service, another $50 at the end of six years service, and another $50 at the completion of ten years service. Other features of the law provide for longevity pay credit for the four postgraduate years spent in medical schools and for the one year spent in medical internship, as well as upgrading of officers now on the active list to reflect the one year increase of constructive service credit. The Council is pleased to report that in the past few months the military services have commissioned more physicians than have resigned. This reversal in loss of medical officers is primarily the result of the enactment of this legislation.

Extension of Doctor Draft Act, Public Law 118.—Following a review of the activities of the Association with respect to its position of opposition to an extension of the Doctor Draft Act, the Council advised the Board in November, 1955, of the excellent and capable presentations made by Dr. Reuben B. Chrisman Jr. and the statements of Dr. Walter B. Martin in testimony furnished the Senate and House Armed Services Committees during the consideration of an extension of the Act. The Board was further advised of the sustained interest and efforts of Dr. Harold S. Diehl during the time this legislation was actively under consideration and debate in the Congress. The Council commended Dr. Diehl for writing Congressman Walter B. Judd of his concern about the misleading statements, distortions of fact and tactics employed to force passage of the bill. A copy of this letter, which was printed in the Congressional Record, was forwarded to the Board of Trustees.

On April 5, 1956, Dr. Harold S. Diehl and Dr. Richard L. Meiling represented the Council and the Association at a meeting called by the Assistant Secretary of Defense (Health and Medical) to discuss the planning for legislative action to succeed the Doctor Draft Act which expires in July, 1957. Amendments to the basic draft act to eliminate all priorities of call-up of physicians and the possibility of requiring medical students to obtain "reserve commissions" were two of several alternatives discussed and considered. Following a report on that meeting by Drs. Diehl and Meiling, the Council advised the Board of Trustees that it felt additional information was needed before action could be recommended on this matter. Further, the Council was not in possession of any additional information to warrant a change in the position of the Association calling for opposition to this type of discriminatory legislation. The Council is continuing its study of the subject and will report thereon at a later date.

Additional Military Medical Activities.—On April 8, 1956, the Council recommended to the Board of Trustees that the Association support H. R. 9429, the bill to provide medical care for dependents of military personnel, except that active opposition was recommended to Section 201 (c) of the bill as the Council felt this would violate the principle of free choice of physician and would tend to perpetuate the personnel problems of the armed forces and the doctor draft; that the Association continue to oppose vigorously H. R. 483, a bill to authorize the appointment of osteopaths as military medical officers; that the Board support immediate construction of adequate facilities for a National Medical Library administratively and geographically attached to a federal medical agency.

Reports were also made by the Council in this reporting period on (1) its survey of civilian medical resources available for military medical requirements, (2) the deferment of medical students who elect to interrupt medical education to assume teaching positions in preclinical departments, (3) health and medical care of six-month trainees under the military reserve program, (4) relaxation of federal dual compensation laws to permit employment of retired military physicians, (5) establishment by the Office of Defense Mobilization of a Reserve Executive Corps, and (6) status report and continued support for expansion of MEND programs.

Survey of Discharged Medical Personnel.—The Council has continued its program of contacting physicians being released from active military service by requesting them to complete a questionnaire to provide information on the utilization of physicians and medical staffing conditions in the Armed Forces. From June, 1952, to July, 1956, the Council sent out 16,583 questionnaires of which 11,434 were completed and returned. Periodic summary reports of these surveys are compiled, analyzed, and published. During the calendar year 1955, 3,651 questionnaire forms were mailed and 2,197 returned. A summary report for this period is currently being tabulated and the results will be published in THE JOURNAL, as well as copies being sent to interested individuals and agencies.

Liaison with Physicians on Active Military Duty.—The Council has continued to prepare monthly articles, since January, 1954, for publication in the *United States Armed Forces Medical Journal.* Articles published during the last six months of 1955 covered (a) a special committee report of the British Medical Association to make military medical careers an attractive alternative to civil practice, (b) a report on the extension of the Doctor Draft Act, (c) summaries of an opinion survey among physicians released from active duty, and (d) a review of the military medical laws enacted during the first session of the 84th Congress.

The Council approved the preparation of a series of articles for publication during 1956 devoted to the American Medical Association, its organization, function, history, and purpose. The first six articles dealt with the history and organization of the Association, the responsibilities and activities of the Council on National Defense, Council on Medical Education and Hospitals, Council on Medical Service, the Law Department, and the Bureau of Investigation of the American Medical Association. This series of articles is being continued during the last half of 1956.

Placement Assistance Program.—The Council has also continued its program to assist physicians being released from active military service by providing information concerning available civilian medical opportunities. In July, 1952, the Council began the practice of writing to each physician being discharged from military service to welcome him back to civilian practice and to assist, if desired, in locating appropriate civilian openings. Each year, the Council receives an increased number of requests for such assistance. As of July, 1956, the Council has sent letters to some 13,119 physicians, 2,488 of whom requested and were given placement assistance. From July 1, 1955, to June 30, 1956, letters were mailed to 2,293 physicians, and of this number 428 requested further information and assistance.

MEDICAL CIVIL DEFENSE ACTIVITIES

In a recent letter to the Administrator of the Federal Civil Defense Administration, President Eisenhower pointed out that an effective civil defense is an important deterrent against attack on our country and thus helps preserve peace. In the event of an attack upon us, the President said that civil defense at once becomes one of our immediate reactions imperatively required for our nation's survival. He observed that our whole civil defense effort needs both strengthening and modernizing, and that it is now evident that the exigencies of the present threat require vesting in the federal government a larger responsibility in our national plan for civil defense. The Council believes this reflects the growing sentiment and realization of the medical profession, as well as a large segment of the civilian population.

Today, civil defense is one of the key elements in efforts to prevent the outbreak of war. Survival will initially rest mainly with the individual and the local community in the event of enemy attack. Physicians and other professionals at the local level will be expected to provide the necessary medical care to prevent human suffering and loss of life. At its last annual meeting, in June, 1956, the American Medical Association expressed its belief that an efficient and practical medical defense system should be developed by the best minds in our nation as such a program is necessary to national survival. The medical profession is convinced that any enemy attack employing weapons of modern war could kill or injure millions of our citizens, and to manage and care for such mass casualties requires new procedures and medical skills using every physician and all ancillary personnel in the country. The medical profession has the solemn responsibility of providing bold leadership, knowledge, and its full participation in the formulation of mobilization plans for emergency medical services.

The Council is encouraged by the increased interest and activities to medical civil defense preparedness, in spite of the fact that much more remains to be done. The Committee on Civil Defense has continued to maintain and promote friendly and cooperative working arrangements within the medical profession and among allied health and medical organizations. At its two regular meetings within this reporting period, invited guests included representatives of the American Dental Association, American Hospital Association, American Nurses' Association, American Veterinary Medical Association, Committee on Trauma of the American College of Surgeons, Committee on Public Relations of the Section on Ophthalmology, Education and Training Division of the Office of the Surgeon General of the Army, Health Office of the Federal Civil Defense Administration, and National League for Nursing. These groups have made substantial progress in civil defense affairs. For example, the American Dental Association has undertaken the development of appropriate definitive programs and has encouraged participation by their local societies. They are exploring the possibility of establishing DEND programs comparable to the current MEND programs. The American Veterinary Medical Association recently sponsored six regional meetings in conjunction with the Department of Agriculture on how to cope with biological warfare. The American Hospital Association prepared and published two manuals entitled "Principles of Disaster Planning for Hospitals" and "Readings in Disaster Planning for Hospitals" which have been distributed to hospitals and other interested groups. The American Nurses' Association is concentrating its activities to a long-range program in disaster nursing, and the National League for Nursing has sponsored several conferences pertaining to recruitment, supervision, and training of nurses and ancillary personnel for civil defense responsibilities. The Education and Training Division, Office of the Surgeon General, Department of the Army, has in operation an eight-point program devoted to emergency medical service training. The ophthalmologists are alerting their members to duties and functions in time of emergency and are working on a program to train lay personnel to protect and prevent ocular injuries. The Committee on Trauma of the American College of Surgeons has held five symposia on mass casualties including a number of programs sponsored throughout the country highlighting mass casualty care. These are but a few of the numerous activities which are being accomplished by mutual efforts and cooperation between medical and health organizations.

The meetings of the Council's Committee on Civil Defense in October, 1955, and April, 1956, produced several important actions. The committee approved a resolution, adopted by the Council and referred to the Board of Trustees, endorsing the use of the 200-bed emergency civil defense hospital unit and urging as rapidly as possible the procurement of these units by the Federal Civil Defense Administration. At the same time, a second resolution, similarly adopted and referred, endorsed a field testing, critical analysis and operational review of the hospital unit. Following favorable action by the Board, these resolutions were endorsed by the House of Delegates in December, 1955. In addition the House, upon recommendation of its Reference Committee on Medical Military Affairs, urged all assistance be provided by the Federal Civil Defense Administration to local communities in target areas so that early distribution of the hospital units be made for training purposes.

Recently, there has been under consideration the need for a change in the concept of the role of military reserve units in the event populated civilian centers are subjected to enemy attack. The committee and Council recommended that the Army, Navy and Air Force be requested to permit instruction in the use of emergency civil defense hospital units and that this be made a part of the training programs of reserve units for which annual unit training and armory drill pay is permitted. The Board of Trustees approved the recommendation and appropriate letters were sent to the military departments.

In May, 1956, the committee and Council recommended to the Board endorsement and support of H. R. 7277, a bill to authorize the transfer of federal surplus property for use in educational purposes, public health purposes, including research, or civil defense purposes. This matter was referred to the Committee on Legislation for appropriate action.

Field Test of FCDA Hospital Unit.—The chairman of the Committee on Civil Defense and the secretary of the Council served on a joint committee composed of representatives of national medical and health organizations to initiate a program to conduct a critical analysis and field test of the 200-bed emergency civil defense hospital unit. It was evident there was an urgent need for the development of manuals, training guides, and other material on how to set up, staff and operate these hospital units, particularly since a number of the units would be scheduled for distribution to state and local civil defense organizations in 1956. The joint committee met in September, 1955, at Battle Creek, Mich., and in November, 1955, in New York City. Detailed plans prepared by the Joint Committee suggested that the U. S. Army conduct the testing operations with observers from seventeen national medical and health organizations to participate as members of "analysis teams." Working closely with the numerous agencies involved, the joint committee submitted its proposed testing program to the Administrator of the Federal Civil Defense Administration, who, in turn, requested and received approval of the Secretary of Defense.

The field testing program was conducted by the Army Medical Service at Fort Meade, Md., on April 10 and 12, 1956. Approximately 100 observers, representing 22 national organizations, viewed the operational exercise. The hospital unit, packaged in some thirty crates, was transported on military vehicles to a prearranged housing site. It was uncrated, set up, and readied for operation. It was staffed by medical corps personnel and simulated casualties were received, processed, and treated. This was the first time the hospital had been evaluated as a complete unit. A number of changes and other recommendations were made by the analysis teams and it was apparent that a second test, incorporating the changes, would be necessary before final revisions and recommendations could be made. Accordingly, a second large-scale testing program was conducted by the Brooke Army Medical Center at Fort Sam Houston, Texas, on June 18-22, 1956. The results of these tests have been compiled. The various recommended changes are being reviewed and analyzed preparatory to development and issuance of appropriate instructional material on how the hospital units should be set up, staffed, and operated.

Special Training of Allied Medical and Health Groups.—In April, 1956, the Council appointed a special committee, composed of Drs. Stafford L. Warren, Roscoe L. Sensenich, and Max L. Lichter, to define and integrate the special medical training of dentists, veterinarians, nurses, and other groups. Following its study and report, the Council will advise the Board of Trustees of its recommendations on the subject.

Liaison with Specialty Groups on Proper Handling of Mass Casualties.—Recognizing the need for greater participation by the various specialty groups and their advice concerning the preparation of manuals and other instructional material for the management and care of mass casualties, the Council approved a recommendation of the committee for the appointment of a special committee to study and make a report on the subject. Drs. Sensenich and Lichter were named to the special committee to obtain information on the emergency care of casualties from the specialty groups and to further assist in defining their role in medical civil defense affairs.

National Medical Civil Defense Conference.—On June 9, 1956, the Council sponsored in Chicago its fourth National Medical Civil Defense Conference. The Conference was attended by 230 individuals from 41 states, Hawaii and Canada. It was the largest and most enthusiastic group to attend one of these conferences. In spite of a long day session, most of the conferees attended an evening session to view selected films on medical techniques under disaster conditions. At the morning session, the President of the American Medical Association, Dr. Dwight H. Murray, welcomed the assembly in behalf of the Association. Congressman Chet Holifield, Chairman of the Military Operations Subcommittee of the House Committee on Government Operations, described the developments of the extensive hearings on civil defense being conducted by the subcommittee. Several medical civil defense topics were covered by outstanding speakers, and Federal Civil Defense officials discussed basic plans concerning the allocation, distribution, and utilization of emergency civil defense hospital units.

County Medical Societies Civil Defense Conference.—The Council sponsored the sixth County Medical Societies Civil Defense Conference in Chicago on Nov. 12 and 13, 1955. These conferences are designed to acquaint physicians at the local level on the practical aspects of community preparation and planning. They provide an excellent opportunity for the exchange of valuable information and material. Workshop sessions were scheduled for a part of the first day and for the entire second day of the conference. One of the highlights was a panel discussion on defenses and effects of nuclear radiation, a subject which unfortunately has not been given the attention it merits. An entertaining feature of the program was the presentation of a civil defense play by the Woman's Auxiliary to the Chicago Medical Society on Saturday evening in the American Medical Association auditorium.

Congressional Hearings on Civil Defense.—Of great interest to the Council are the recent hearings conducted by the Military Operations Subcommittee of the House Committee on Government Operations in the field of civil defense for national survival. On June 19, 1956, Drs. Harold S. Diehl and Harold C. Lueth, as members of the Council and on behalf of the Association, presented testimony to the subcommittee on the medical aspects of civil defense preparedness and outlined the interest and activities of the Association in this field. The hearings are the most extensive investigation of civil defense undertaken by a committee of the Congress. Six months of staff study were followed by public hearings from January through June, 1956. As a result of these hearings, some 13 recommendations were made by the subcommittee which were approved and adopted by the full committee and a copy transmitted to the Speaker of the House. Recommendations included the creation of a permanent Department of Civil Defense, the dedrafting of federal legislation to vest the basic responsibility for civil defense in the federal government with supporting roles for state and local governments, formulation of a master plan for nationwide civil defense, increased financial participation by the federal government including greater utilization of available federal resources and facilities, a study and definition of the role of military forces in civil defense, and several other matters designed to strengthen and promote an adequate nationwide civil defense program. The Council's Committee on Civil Defense will study the several recommendations of the subcommittee, and a report will be made at a later date to the Board of Trustees.

Other Civil Defense Activities.—Members and the secretary of the Council have attended and participated in a number of civil defense meetings designed to facilitate and expedite medical preparedness at national and local levels. The Council has continued to maintain effective liaison with federal and state governmental agencies and with allied health organizations.

APPRECIATION

The Council wishes to express its appreciation for the cooperation and assistance it has received from the Board of Trustees and officers of the Association, from allied professional organizations, and from agencies of the federal government with which it has worked during the period covered by this report.

Report of the Council on Scientific Assembly

The report of the Council on Scientific Assembly includes the following items: Council meetings; the Boston Clinical Meeting; the Chicago Annual Meeting; motion pictures and medical television. This is the first time that motion pictures and medical television have appeared in the report of the Council. Formerly they were included in the report of the Bureau of Exhibits.

COUNCIL MEETINGS

The Council on Scientific Assembly held four meetings during the year in preparation for the Clinical Meeting in Boston and the Annual Meeting in Chicago. Numerous subjects were discussed among which the following items are noted:

Requests for New Sections.—Requests were received by the Council for new sections on public health, history of medicine, and allergy, all of which received careful consideration. Since the public health group is already represented in the Section on Preventive and Industrial Medicine and Public Health (the name of the Section has since been changed to the Section on Preventive Medicine), the Council voted that the public health group should confer with the officers of the above section and come back with a unified request. The Council recommended that a Section on the History of Medicine be not established at the present time because of apparent lack of interest. The subject would not be excluded from the program, however, but would be carried in the Section on Miscellaneous Topics whenever desired. The Council received a delegation of allergists at the June meeting and has under consideration the request for a Section on Allergy.

Requests for Special Features.—The Council considered a request for a Session on Asphyxial Deaths together with a group of ten exhibits representing various phases of the subject. The matter was referred to the section secretaries for further consideration. The proposal of Dr. George E. Burch, New Orleans, Secretary of the Section on Internal Medicine, for special demonstrations on cardiovascular diseases in the Scientific Exhibit was approved.

Science Fairs.—The Council received a proposal from the Public Relations Department concerning recognition of the best medical exhibits from high school students at the National Science Fair. Accordingly a committee of the Council attended the National Science Fair in Oklahoma City and selected four exhibits for special mention. Two of these exhibits were shown at the June meeting and were attended by the students who prepared them.

Traffic Accidents.—The Exhibit Symposium on Traffic Accidents at the Chicago meeting together with round tables, lectures, and talks on "The Medical Aspects of Crash Injuries" created much interest. As a result a motion picture, entitled "On Impact" based on the exhibits was produced with the assistance of the Ford Motor Company.

Evening Meetings During Convention.—Arrangements were made for three scientific evening meetings during the Chicago meeting. One was under the auspices of the Section on Ophthalmology, and two under the auspices of the Council, when motion pictures were shown. This is a trend which the Council is watching with interest.

Survey of Attendance.—The Council recommended to the Board of Trustees that a survey be made of attendance at medical meetings, both national and local.

Motion Pictures and Medical Television.—The Committee on Motion Pictures and Medical Television was disbanded and the work transferred to the Council on Scientific Assembly.

Committee Appointments.—The Chairman of the Council appointed various committees to expedite the work of the Council.

Conference of Section Secretaries and Representatives.—The Council voted to ask the Trustees for an appropriation so that the Section Representatives could meet with Section Secretaries, because of the great importance of coordinating the activities of both groups.

Changing Aspect of Medical Meetings.—The Council has noted with interest the changing aspects of medical meetings and is alert to the problem of the desires and needs of the physician of today.

Goldberger Lecture.—The Council received a memorandum from the Board of Trustees concerning the presentation of the Goldberger Lecture at the Annual Meeting. Arrangements are under consideration for the presentation of this Lecture with the understanding that whatever costs are involved will be defrayed by the Nutrition Foundation.

Editorials for Publication.—The Council discussed the situation where the Section on Ophthalmology sponsored editorials concerning problems other than strictly scientific information.

"Two Year Rule" for Sections.—One of the sections requested that the Council establish a rule that no physician was to present a paper before a section two years in succession. The Council voted that, since each section makes its own rules, it was up to the section to make such a ruling rather than the Council.

Suggestions for Section Officers.—At the request of various section officers, the Council instructed the secretary to compile "Suggestions for Section Officers," a preliminary copy of which has been sent to the section officers for their comments.

Scientific Exhibits 1956.—The 1955 publication of this volume was so satisfactory that Grune & Stratton continued the venture with a 1956 publication. A new departure was the inclusion of a few pictures from the Technical Exposition on an experimental basis. These were carried in the same manner that advertising is carried in a medical journal.

Fracture Committee.—Dr. Charles V. Heck, Chicago, was appointed a member of the Special Exhibit Committee on Fractures in place of Dr. Herbert W. Virgin, Miami, Fla., who resigned.

Gross Pathology.—Acknowledgment was made to E. R. Squibb and Sons for a contribution of $2,000 to the Section on Pathology and Physiology for help in presenting the special exhibit on gross pathology.

Duplication of Subjects on the Program.—The Council noted the occasional occurrence of the same subject being discussed in two different sections at the same time. Measures to solve this problem are under consideration.

Closer Affiliation with Sections.—The Council on Scientific Assembly has continued to use every opportunity to affiliate itself as closely as possible with the various sections. The Council was host to the section secretaries at an all day meeting in October, 1955, and was host to the section representatives to the Scientific Exhibit at a dinner during the Annual Meeting in Chicago. Members of the Council were guests of the section delegates at breakfast at both the Boston Clinical Meeting and the Chicago Annual Meeting. The Council has under consideration plans for a combined meeting of the section secretaries and the section representatives in the near future.

BOSTON CLINICAL MEETING

The Clinical Meeting held in Boston in the historic Mechanics Hall was unique for its compactness and enthusiasm. There was a complete scientific program of lectures, color television, motion pictures, and scientific exhibits. The Local Committee on Arrangements, of which Dr. Frank P. Foster of Boston was Chairman, did a magnificent job in arranging the program in all its details.

The lecture program, presented in three halls simultaneously from Tuesday morning to Friday noon, covered a wide variety of subjects of interest to the physician in general practice. Seventy-four papers were presented, including one on diabetes by Dr. Elliott P. Joslin, Boston, and one on cardiovascular diseases by Dr. Paul Dudley White, Boston. In addition there were 11 clinicopathological conferences, round tables, and panels that attracted much attention. The program was so arranged in periods of thirty minutes that physicians were able to go from one hall to another without losing what they wanted to hear. Dr. Theodore L. Badger was Chairman of the Program Committee.

Color television originated in Deaconess Hospital and was shown in Mechanics' Hall. Surgery was on the program in the morning each day with medical subjects in the afternoon. Among other features was a clinic on poliomyelitis and a symposium on the management of anesthetic emergencies, with a total of 22 different subjects during the meeting. Dr. Alexander Marble, Boston, was chairman of the television committee and the program was presented in cooperation with the Smith, Kline and French Laboratories of Philadelphia.

The motion picture program, prepared with the cooperation of Dr. Norman Lenson, Boston, was shown on a definite schedule each morning and afternoon. There were 48 films and in some instances the authors were present to discuss their findings. Among other features was a panel discussion on carcinoma of the breast. In addition to the daytime program there was a special film program in the Statler Hotel on Wednesday evening with the authors introducing their films and answering questions. Myasthenia gravis was shown by Dr. Henry R. Viets, Boston, and hepatic lobectomy by Dr. George T. Pack, New York.

The Scientific Exhibit was located in close proximity to the meeting rooms and proved exceedingly popular. There were 88 exhibits presented by leading teachers and investigators of the United States, with one exhibit from Canada. The subjects covered a wide range of topics selected for their general interest to the physician in general practice. Special features included fractures under a committee of which Dr. Ralph G. Carothers, Cincinnati, was chairman, and manikin demonstrations on problems of delivery, with a program arranged by Dr. Robert H. Barker, Boston. The diabetes exhibits were supplemented by question and answer conferences on diabetes under the chairmanship of Dr. Howard F. Root, Boston, with daily programs from 11 a. m. until 2 p. m.

Chicago Annual Meeting

The program for the Chicago Annual Meeting was excellent, with more than 2,000 physicians and scientists participating in lectures, color television, motion pictures, and scientific exhibits.

General lectures were given on Monday which included a symposium on poliomyelitis; and on Friday morning, consisting of a symposium on traffic accidents. The 21 sections met Tuesday, Wednesday, and Thursday, with a combined meeting Friday morning between the Sections on General Practice and Diseases of the Chest on arteriosclerotic heart disease. This drew a large audience.

The sections presented 244 papers in addition to which there were 30 panel discussions, symposiums and round tables. Attendance at section meetings varied from a high of 523 to a low of 35. Most of the sections held combined meetings with other sections at least once during the week. Meeting rooms were of necessity scattered over a considerable area, and in spite of the best efforts of all concerned some were not too desirable.

Color television and motion pictures were located on Navy Pier and presented complete programs throughout the week. Color television originated at the University of Illinois Research Hospital, where the demonstrations took place while a coordinator assisted with a discussion for the audience. The motion picture program during the day was supplemented by one evening program with a symposium on Diseases of the Gallbladder and Common Duct. Dr. Warren H. Cole, Chicago, served as moderator while the authors introduced their films and answered questions from the audience. A group of Russian films were shown another evening.

The Scientific Exhibit on Navy Pier was spectacular for the beautiful exhibits displayed. There were 320 exhibits in all, arranged in groups dealing with the respective specialties. Several of the sections presented special features, chief among which were cardiovascular demonstrations by the Section on Internal Medicine, pulmonary function testing by the Section on Diseases of the Chest, gross pathology by the Section on Pathology and Physiology, and physical examinations for physicians conducted by the Section on General Practice. Results of 1,000 examinations indicated that 85% of the physicians examined were normal, while 15% showed some pathology. The Section on Urology held a formal discussion of all urology exhibits each morning at 10 o'clock. Other features of the Scientific Exhibit included the special exhibit on fractures, under the chairmanship of Dr. Ralph G. Carothers, Cincinnati; the exhibit symposium on traffic accidents arranged by Dr. Fletcher D. Woodward, Charlottesville, Va.; and the exhibit symposium on arthritis and rheumatism arranged by Dr. John W. Sigler, Detroit. There were two question and answer conferences in connection with the exhibits—one on diabetes from 10 a. m. to 2 p. m. daily under the chairmanship of Dr. Howard F. Root, Boston, and one on cardiovascular diseases presented by an outstanding group of cardiologists under the leadership of Dr. George E. Burch, New Orleans.

Medal awards were presented to six exhibits, while section awards consisted of 22 certificates of merit, 27 honorable mentions, and two certificates of appreciation. The Committee on Awards, under the chairmanship of Dr. Frank Konzelmann, Washington, D. C., worked faithfully and conscientiously to bring in a good report. Assistance was given by section officers, who made recommendations to the Committee on Awards. In addition to the above awards, the Section on Ophthalmology presented a prize of $250 to the best exhibit in that section and the Section on Urology presented two John Morrissey Awards.

Admission to the Scientific Exhibit, as well as to color television and motion pictures, was restricted to physicians only on two mornings. This reduced the attendance to some degree, but a greater factor was the extreme heat and long distances to walk. Busses that circulated continuously the length of Navy Pier were very popular. The Council is deeply concerned about the inadequacies of lecture rooms and exhibit facilities which reflect upon the success of the meeting as a factor in graduate medical education.

Motion Pictures and Medical Television

During the past year, the Board of Trustees transferred the work of the Committee on Motion Pictures and Medical Television from the Bureau of Exhibits to the Council on Scientific Assembly. The committee was disbanded, but members were retained as consultants to the Council, and the title of the secretary of the committee was changed to Director of Motion Pictures and Medical Television. Mr. Daryl Miller, formerly production manager for a medical film producer, joined the staff in December, 1955, as an assistant to the Director.

Film Library.—Nineteen new films were added to the motion picture film library making a total of 852 prints of 147 subjects. During the year 3,504 films were lent to medical societies, medical schools, hospital staff groups, individual physicians, and television stations. This represents an increase of approximately 500 film shipments in comparison with the previous year. The income from service charges was approximately $8,050.

In addition to the above films, 80 prints were placed in the library for distribution by the Public Relations Department and the Bureau of Health Education, representing approximately 15% of the total number of prints in the regular film library. There is a definite need for additional space to store and handle the increased volume.

Film Reviews.—In cooperation with specialists in various fields of medicine, surgery, and health education, 76 reviews of medical and health films were published in The Journal. Fifteen reviews were prepared for publication in *Today's Health*. Based on letters received following each publication, this new feature in *Today's Health* has proved to be extremely popular.

Conferences and Meetings.—Special mention should be made of the continued interest and popularity of evening film sessions which started a few years ago at the annual meetings. An evening film symposium on "Diseases of the Gallbladder" was very well attended at the Annual Meeting this year. During the year, the Director addressed several national organizations including the New England Health Education Association, the New York and Midwest Pharmaceutical Advertising Clubs, the Society of Motion Picture and Television Engineers, and the Calvin Motion Picture Workshop. At the request of the Los Angeles County Medical Association, the Director assisted in the organization of the film program for the Cavalcade of Health cards at the source where the information is verified will improve the decks of punchcards and should be useful to other departments. The transition from the old system which has been under the direction of the Director for the past 10 years took place during August, 1956, through the establishment of a coordinator. The Director believes that the new system can improve the use of IBM machines and staff at headquarters. Hence, this is the last report of the present Director dealing with the IBM section of the Bureau which has performed extensive services during the past 10 years not only for the Bureau's research program but for many departments, committees, and councils at headquarters.

Report of the Directory-Biographical Department

During the period of this report, from July 1, 1955, to June 30, 1956, the publication of the 19th edition of the American Medical Directory was completed, and copies of the book were shipped to subscribers.

On the basis of schedules furnished by the printer in Minneapolis about the middle of 1955, it had been expected that printing of the book would be completed in 30 consecutive working days beginning Nov. 1. The printer, however, required more than five months to print this edition, completing the last form during the fourth week of April, 1956. There was a further delay of several weeks when it became necessary to rerun some forms of which a sufficient number had not been printed, so that binding of a total of 17,258 copies of the 1956 edition was not completed until the end of August, 1956.

The new Directory, the first since 1950, contains 3,122 pages, with biographical information on 240,638 physicians in the United States, its dependencies, and Canada, and on American graduates temporarily located in foreign counties. Since the 1950 Directory, more than 250,000 changes of address have been recorded in the files of the Directory-Biographical Department, 46,348 names of physicians have been added, 24,225 deleted because of death, and an additional 1,172 deleted for other reasons.

In the body of the Directory, which is arranged by state (or province), city, and name of physician, the biographical data show, whenever available, the year of birth, medical school and year of graduation, year licensed in state in which located, type of membership held in the American Medical Association, other national medical society affiliations, specialty practiced, certification by a specialty board, professorships, and residence and office addresses. This section also contains a list of physicians whose addresses are unknown, and a list of the physicians whose names were entered in the files of the Directory-Biographical Department after publication of the 18th Edition in 1950 and who have since died.

To gain space so that the Directory could include in a single volume information on more physicians, it was necessary to make some editorial changes. The list of members of special societies, which formerly appeared in the front section of the Directory was deleted, but symbols to indicate memberships in national medical organizations appear in the biographical data of the physicians. A special committee of the Board of Trustees revised the criteria for the listing of membership in national medical organizations, and the societies whose members are eligible for listing in the physicians' data are given in the key to abbreviations and symbols, which is reprinted in several locations in the book.

In the 1956 Directory, the total number of physicians listed in the United States is 218,061, a gain of 16,784 over the number in the 1950 edition, or an average yearly gain for the past six years of 2,797. For Canada, the 1956 Directory lists 17,906 physicians, a gain of 3,310 over the 1950 total, or an average yearly gain of 551. The Pacific states show the largest increase in physicians for 1956, with a gain of 23% over the 1950 figures; the South Atlantic and the Mountain states show gains of about 16%; and the Central, Middle Atlantic, and New England states show small gains. California leads the other states in the number gained, with 20,763 physicians in the 1956 Directory as compared with 16,668 in the 1950 edition, a gain of 24.6%. Florida, showing a gain of 49.8%, lists 4,530 physicians as compared with [illegible],025 in 1950. Texas shows a gain of 1,026 physicians; Ohio, [illegible]; Michigan, 963; and New York, 934. Among the smaller states showing a substantial increase in the number of physicians are Arizona, New Mexico, Oregon, and Utah. Slight losses in the number of physicians are indicated in the 1956 Directory for Arkansas, Illinois, Iowa, Missouri, Vermont, and West Virginia.

Five tables of statistical information on the medical profession and hospitals appear in the front section of the 1956 Directory. The table showing the distribution of physicians by specialty in the United States and Canada has been expanded to give a breakdown of those who claim to be interested in a specialty, those who claim to limit their practice to a specialty, and those who have been certified as specialists by an examining board in a medical specialty.

In another of the tables of statistical information, showing the number of physicians by states, classified as to type of practice, it is indicated that 30% of the physicians in the United States are in general practice; 31% limit their practice to a specialty; 10% give special attention to a specialty but do not limit their practice to it; 11% are serving internships or residencies; an additional 6% are in other full-time hospital services; 5% are retired or not in practice; 4% are not in private practice; and 3% are temporarily in military service or serving in various government agencies.

Other tables of statistics compare the number of physicians and hospitals in the current edition with the numbers in the 1950 edition; the number of physicians listed by state in each edition of the Directory beginning with Volume 1, in 1906, and similar figures by state showing the number of hospitals in each edition since 1906.

The 1956 edition, for the first time, gives recognition to the work of the Woman's Auxiliary to the American Medical Association by listing its various officers for the current year. Also new in the 1956 Directory are the list of Honorary members of the American Medical Association and the list of Affiliate members who are not otherwise listed in the Directory.

In itself, the publishing of the Directory is a tremendous undertaking, requiring an experienced, well-trained, and adequate staff to compile, edit, and record the vast amount of information received from the medical profession, various official bodies, medical schools, medical societies, alumni associations, and governmental agencies. The Directory-Biographical Department carries on not only the work of compiling and editing the Directory but also the equally important task of maintaining biographical records for the convenience and information of other departments, councils, and bureaus of the Association, outside organizations, the medical profession, and the general public. The Department serves as a clearing house of information on the medical profession, as its geographical files, which contain information on professional affiliations, faculty appointments, changes in type of practice, and local addresses provide a continuing biographical history of each physician. The physician's history, which can be readily ascertained from the manual cards, has proved to be of considerable value in the work of the Association, especially in view of the fact that under the various electronic methods commonly employed for statistical or addressing purposes, the historical continuity of the physician's biography is either lost or becomes, for practical purposes, unavailable. From July 1, 1955, to June 30, 1956, the Department has supplied information on the medical profession in answer to an average of 125 telephone calls a day and more than 5,000 mail inquiries during the 12-month period. It is estimated that, during the same period, 15,000 membership applications have been checked for the Secretary's Office; 2,000 applications have been verified for four examining boards in a medical specialty and a national medical organization; 6,000 license applications had already been processed for the Council on Medical Education and Hospitals until the procedure was recently placed under the jurisdiction of the Directory-Biographical Department.

The Department also furnishes, through its semimonthly Directory Report Service, the basic information for the I. B. M. files. A new section added to the Service during the early months of 1956 reports changes in type of practice, specialty, and appointments.

The files of the Department are also routinely used by personnel of the Membership-Circulation Department to identify the remitters of membership dues, to ascertain current addresses and to verify eligibility to exemption from the payment of dues on the basis of postgraduate training, temporary military service retirement, or attainment of age 70. The Directory-Biographical Department regularly checks, for various headquarters units, information on authors, participants in meetings and conferences, prospective advertisers, and other correspondents. Every effort is made to perform the services requested by alumni associations, medical societies, and allied organizations in supplying information concerning members of the medical profession.

With the distribution of the 1956 edition of the Directory, there has been some lessening of inquiries, as use is made of copies available for reference. To date, more than 16,000 copies of the 1956 Directory have been shipped, and it is expected that the entire issue will be exhausted before the next edition is published. The House of Delegates in June, 1955, recommended that the Directory be issued at intervals of two years. At that time approval was also given to the proposal that there be omitted from the next edition the Medical Practice Acts and the residence addresses of physicians, which changes should make it possible to continue to issue the Directory in a single volume for at least another edition.

An analysis of the subscriptions received for the Directory indicates that the book fulfills a professional, rather than a commercial, need. To the end of July, 1956, copies were distributed as follows:

Type of Subscriber	*Percentage of Total Orders*
Physicians, for individual use	44.1
Hospitals and clinics	21.2
Libraries	3.3
Health Departments	1.4
Federal agencies	3.2
Medical societies	2.9
Medical schools	3.2
Insurance companies	5.1
Commercial firms, miscellaneous	15.6
	100.0

In addition to income received from the sale of the Directory, which has a list price of $30, and of advertising space in the book, revenue to cover the cost of compilation is received from subscribers to the Directory Report Service. This supplementary service is furnished on a subscription and service-fee basis to large mailers of circular material, and to authorized addressing companies. However, because of the cost of printing the 1956 edition will be in excess of $310,000, the cost of binding about $37,000, paper stock about $33,000, packing and shipping costs over $22,000, in addition to editorial costs of about $1,155,000 during the five-year period, it is expected that income on the current edition will not greatly exceed expenses.

Investigations carried on in the Department during 1955 and 1956 point to the fact that printing costs on future editions of the Directory can be materially reduced through the use of a combination of panel-index cards and offset printing, instead of the current use of letterpress printing. Economies have already been effected in the Department by a reduction of office personnel from a previous ceiling of 125 employees to a current staff of 85 persons, and it is expected that the establishment of a regular biennial schedule of publication will make it possible to work out longer-range plans that should bring about further economies in the cost of compilation without restricting the extent and value of services rendered by the Directory-Biographical Department to other units of the Association and to the medical profession at large.

REPORT OF THE JUDICIAL COUNCIL

To the Members of the House of Delegates of the American Medical Association:

During the course of the past year the Judicial Council has held its usual number of meetings and has considered in the neighborhood of 1200 inquiries concerning interpretations and applications of the Principles of Medical Ethics of the American Medical Association. The majority of the inquiries pertained to the following subjects: associations between physicians and osteopaths; associations between physicians and optometrists; ownership of drugstores or pharmacies either by individual physicians or by groups of physicians; advertising by physicians; solicitation of patients; and remuneration of physicians for rendering medical services to another physician or his dependents. All of these subjects have been commented on in past annual reports of the Council.

The Council heard two appeals during the year. After careful review of the records and arguments in each case, the Council came to the conclusion that the county societies and state associations concerned had observed and properly followed the provisions of their constitutions and bylaws. In each instance the Judicial Council sustained the action of the state association affirming the decision of the county society.

The appeal proceedings before the Judicial Council were conducted under the Rules of the Judicial Council adopted Oct. 1, 1954. In each appeal the appellant-physician and the medical societies were represented by legal counsel. The Council is impressed with the effort legal counsel made to bring all facts and arguments of value to its attention. The Council believes that members of the legal profession like members of the medical profession, have respect for ethical principles, and that the practice of permitting parties to hearings to be represented by attorneys has proved successful. The Council has made full use of the services of the Law Department of the Association and is indebted to it for much valuable assistance.

The Council recommends to county societies and state associations that they seek the advice of their attorneys, particularly when it may be anticipated that appeal or legal proceedings will result from some action contemplated or taken by the medical organization. This recommendation is offered as one means of preventing error which may lead to costly litigation.

Discipline by Resolution

The Council would repeat comments previously made in its reports to this House concerning short cuts to discipline. Attempts are being made by some societies to regulate undesirable conduct or situations by hastily considered and adopted amendments to bylaws, by the adoption of resolutions or the establishment of rules of conduct directed to a specific, undesirable practice existing at the moment. Sometimes small regard is paid to the provisions of established constitutions and bylaws and short cuts to disciplinary action are sought, usually by making loss of membership automatic on violation of the newly adopted bylaw, resolution, or rule of conduct.

Such procedures are undesirable for several reasons. They, in effect, represent power politics and government by minority. They usually stem from passion and prejudice rather than from reason. They fail to correct basic errors of judgment predicated on false premises. Most importantly they may occasion loss of membership in a county society, with consequent loss of membership in the constituent association and in the American Medical Association, for an action which although disapproved of locally may be considered neither unethical or improper in other communities. Such procedure creates the impression that there is no uniformity of principles within medicine. The Principles of Medical Ethics are broad and are adequate to cover situations where loss of medical society membership may be indicated.

Local Construction and Interpretation of Principles

Altogether too infrequently the Judicial Council receives notice of interpretations or discussions of medical ethics by councils or boards of censors of medical associations and societies, or by editors of medical and related journals. This is unfortunate. These interpretations and expressions are of interest to the Council and the profession generally and should receive wider distribution. It is the earnest wish of the Council that it be furnished copies of these expressions or interpretations, or that it be given notice of them. As the Council continues to publish its opinions in THE JOURNAL it can accept and publish, for the benefit of the profession, significant opinions of these councils, boards of censors, and editors. At present, the profession at large has but little advantage of the constructive thinking of these informed groups.

The application of the Principles of Medical Ethics locally is inevitable and necessary. Interpretations at that level are less frequently necessary. In either situation, however, it is only with full knowledge of all the facts involved, including the intent of the one charged with violating ethical principles, that just and proper results can be achieved. Except in isolated instances the local society alone is in a position to obtain and analyze all the facts and properly apply the Principles of Medical Ethics.

How ethical principles have been applied in a given factual situation constitutes precedent which should become available as a guide to the solution of subsequent problems of other physicians and medical societies. The Judicial Council has the staff and facilities to receive reports of applications of the Principles, to index and annotate them, and to publish such of them as are of practical importance. Such precedents may be all that is needed to prevent an unintentional infringement of ethical principles or to halt a practice, just beginning, which inevitably will lead to unethical conduct.

Charges of Unethical Conduct

The Judicial Council is of the opinion that the preparing of formal charges of unethical conduct and the holding of hearings thereon should be reserved for situations in which investigation has established a prima facie case of unethical conduct. Physicians are presumed to be ethical. Only reasonable grounds for believing unethical conduct occurred warrants the bringing of charges and the scheduling of a hearing. When the conduct of men of high ideals is questioned, caution should be exercised. The accuser has the burden of establishing that there is reasonable ground for believing that an unethical act has been committed. The accused should never be required to prove first that he is innocent of an alleged or suspected violation of ethical principles.

When the ethical conduct of a physician is questioned it is not only *his* reputation and career that is at stake, but the dignity of the profession is also challenged. The serious nature of a charge of unethical conduct demands judicious management in order to protect the reputation of the individual physician and to maintain the dignity and honor of the profession. Mature, objective, discreet, preliminary investigation would seem to be imperative. While medical organizations have an obligation to consider complaints, this obligation does not require blind, defensive, or precipitous action. A preliminary investigation is necessary. Often it may disclose the existence of a simple misunderstanding; it may reflect unfamiliarity with local custom and practice; it may result in corrective action being taken voluntarily without adverse reflection on physician or profession. When and if the existence of a serious situation is disclosed and when it is established that there is reasonable ground for believing that ethical principles have been violated, charges should then be prosecuted.

Admittedly heavy responsibility rests with the officers and members of component and constituent medical societies for the maintenance of high ethical standards. That this responsibility is discharged well is proved by the caliber of the medical profession in the individual community. To the countless number of physician members of this Association, who, in their local societies furnish leadership, counsel, advice, and example in the observance of ethical standards the Judicial Council says "well done."

Proposed Principles of Medical Ethics

As directed by the House of Delegates, the Judicial Council met jointly with the Council on Constitution and Bylaws during this past year to consider a proposed revision of the Principles of Medical Ethics submitted to the House for its consideration at its Boston, 1955, session. As a result of this joint meeting, a subsequent draft of the Principles of Medical Ethics was prepared and submitted to the House of Delegates at its Chicago, 1956, session. This second proposed revision consists of a preamble and 10 sections which, in the opinion of the members of the two Councils, embrace the ethical concepts set forth at length in the present version of the Principles of Medical Ethics.

The Judicial Council is pleased to know that there has been a rather wide publication of these "proposed Principles," because if adopted they will represent *the* Principles of Medical Ethics of the American Medical Association. Thorough discussion of them by the members of the Association is necessary if they are to be the correct and accurate expressions of those fundamental concepts which guide the physician to ethical conduct.

The Judicial Council has endorsed these proposed principles but it would be remiss if it did not insist that they be thoroughly considered and understood before being put to a vote and adopted. Every effort should be made to insure that any revision accepted by this House of Delegates will reflect credit to the Association and become a permanent document for the guidance of all physicians in the ethical practice of their profession.

Respectfully submitted,

HOMER L. PEARSON, JR., Chairman.

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association:

The Council on Medical Education and Hospitals submits the following report covering the period from July 1, 1955, to June 30, 1956.

During this period the Council has concerned itself with the various matters referred to it by the House of Delegates, and in the conduct of its numerous established functions. The latter include the survey and evaluation of medical schools, survey and evaluation of graduate medical education offered through internships, residencies, and fellowships, the collection of data on and listing of postgraduate opportunities in medical education, and the evaluation of certain technical school programs. In the conduct of these functions the Council and its staff have endeavored to contribute to and stimulate continuous study and progress in medical education at all levels. Such activities have necessitated consultations, conferences, collaboration, liaison, and intercommunication with an ever increasing number of individuals and groups representing medical schools, hospitals, agencies, organizations, and institutions interested in and concerned with medical education in some or all of its aspects. Accreditation of undergraduate and graduate programs in medical education, together with the collection, compilation, and dissemination of statistical and other information concerning medical schools, internships, residencies, postgraduate courses, medical licensure, and related matters have all proceeded in line with established custom.

In cooperation with representatives of other agencies (the Association of American Medical Colleges, the American Hospital Association, and the Federation of State Medical Boards of the United States), the Council aided in completion of the basic studies associated with the organization of the Evaluation Service for Foreign Medical Graduates. It has also continued the study of postgraduate medical education and is currently engaged in developing "basic guides" for programs in this field. Pursuit of other established functions has necessitated further studies in relation to internship, the establishment of an advisory committee on physical therapy education, cooperation in planning Medical Education Week, cooperation in association with other councils and committees in the studies made on the Joint Commission on Accreditation of Hospitals and the private practice activities of full-time faculty personnel. The Council has also engaged in the review of the proceedings of the first World Conference on Medical Education and is cooperating in the initial planning of the second World Conference on Medical Education scheduled for 1959 in Chicago. In February, 1956, the Council carried the major responsibility for the program of the 52nd Annual Congress on Medical Education and Licensure which brought together the largest group of medical educators and practitioners ever to attend such a program.

it be given notice of them. As the Council continues to publish its opinions in The Journal it can accept and publish, for the benefit of the profession, significant opinions of these councils, boards of censors, and editors. At present, the profession at large has but little advantage of the constructive thinking of these informed groups.

The application of the Principles of Medical Ethics locally is inevitable and necessary. Interpretations at that level are less frequently necessary. In either situation, however, it is only with full knowledge of all the facts involved, including the intent of the one charged with violating ethical principles, that just and proper results can be achieved. Except in isolated instances the local society alone is in a position to obtain and analyze all the facts and properly apply the Principles of Medical Ethics.

How ethical principles have been applied in a given factual situation constitutes precedent which should become available as a guide to the solution of subsequent problems of other physicians and medical societies. The Judicial Council has the staff and facilities to receive reports of applications of the Principles, to index and annotate them, and to publish such of them as are of practical importance. Such precedents may be all that is needed to prevent an unintentional infringement of ethical principles or to halt a practice, just beginning, which inevitably will lead to unethical conduct.

Charges of Unethical Conduct

The Judicial Council is of the opinion that the preparing of formal charges of unethical conduct and the holding of hearings thereon should be reserved for situations in which investigation has established a prima facie case of unethical conduct. Physicians are presumed to be ethical. Only reasonable grounds for believing unethical conduct occurred warrants the bringing of charges and the scheduling of a hearing. When the conduct of men of high ideals is questioned, caution should be exercised. The accuser has the burden of establishing that there is reasonable ground for believing that an unethical act has been committed. The accused should never be required to prove first that he is innocent of an alleged or suspected violation of ethical principles.

When the ethical conduct of a physician is questioned it is not only *his* reputation and career that is at stake, but the dignity of the profession is also challenged. The serious nature of a charge of unethical conduct demands judicious management in order to protect the reputation of the individual physician and to maintain the dignity and honor of the profession. Mature, objective, discreet, preliminary investigation would seem to be imperative. While medical organizations have an obligation to consider complaints, this obligation does not require blind, defensive, or precipitous action. A preliminary investigation is necessary. Often it may disclose the existence of a simple misunderstanding; it may reflect unfamiliarity with local custom and practice; it may result in corrective action being taken voluntarily without adverse reflection on physician or profession. When and if the existence of a serious situation is disclosed and when it is established that there is reasonable ground for believing that ethical principles have been violated, charges should then be prosecuted.

Admittedly heavy responsibility rests with the officers and members of component and constituent medical societies for the maintenance of high ethical standards. That this responsibility is discharged well is proved by the caliber of the medical profession in the individual community. To the countless number of physician members of this Association, who, in their local societies furnish leadership, counsel, advice, and example in the observance of ethical standards the Judicial Council says "well done."

Proposed Principles of Medical Ethics

As directed by the House of Delegates, the Judicial Council met jointly with the Council on Constitution and Bylaws during this past year to consider a proposed revision of the Principles of Medical Ethics submitted to the House for its consideration at its Boston, 1955, session. As a result of this joint meeting, a subsequent draft of the Principles of Medical Ethics was prepared and submitted to the House of Delegates at its Chicago, 1956, session. This second proposed revision consists of a preamble and 10 sections which, in the opinion of the members of the two Councils, embrace the ethical concepts set forth at length in the present version of the Principles of Medical Ethics.

The Judicial Council is pleased to know that there has been a rather wide publication of these "proposed Principles," because if adopted they will represent *the* Principles of Medical Ethics *of* the American Medical Association. Thorough discussion of them by the members of the Association is necessary if they are to be the correct and accurate expressions of those fundamental concepts which guide the physician to ethical conduct.

The Judicial Council has endorsed these proposed principles but it would be remiss if it did not insist that they be thoroughly considered and understood before being put to a vote and adopted. Every effort should be made to insure that any revision accepted by this House of Delegates will reflect credit to the Association and become a permanent document for the guidance of all physicians in the ethical practice of their profession.

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association:

The Council on Medical Education and Hospitals submits the following report covering the period from July 1, 1955, to June 30, 1956.

During this period the Council has concerned itself with the various matters referred to it by the House of Delegates, and in the conduct of its numerous established functions. The latter include the survey and evaluation of medical schools, survey and evaluation of graduate medical education offered through internships, residencies, and fellowships, the collection of data on and listing of postgraduate opportunities in medical education, and the evaluation of certain technical school programs. In the conduct of these functions the Council and its staff have endeavored to contribute to and stimulate continuous study and progress in medical education at all levels. Such activities have necessitated consultations, conferences, collaboration, liaison, and intercommunication with an ever increasing number of individuals and groups representing medical schools, hospitals, agencies, organizations, and institutions interested in and concerned with medical education in some or all of its aspects. Accreditation of undergraduate and graduate programs in medical education, together with the collection, compilation, and dissemination of statistical and other information concerning medical schools, internships, residencies, postgraduate courses, medical licensure, and related matters have all proceeded in line with established custom.

In cooperation with representatives of other agencies (the Association of American Medical Colleges, the American Hospital Association, and the Federation of State Medical Boards of the United States), the Council aided in completion of the basic studies associated with the organization of the Evaluation Service for Foreign Medical Graduates. It has also continued the study of postgraduate medical education and is currently engaged in developing "basic guides" for programs in this field. Pursuit of other established functions has necessitated further studies in relation to internship, the establishment of an advisory committee on physical therapy education, cooperation in planning Medical Education Week, cooperation in association with other councils and committees in the studies made on the Joint Commission on Accreditation of Hospitals and the private practice activities of full-time faculty personnel. The Council has also engaged in the review of the proceedings of the first World Conference on Medical Education and is cooperating in the initial planning of the second World Conference on Medical Education scheduled for 1959 in Chicago. In February, 1956, the Council carried the major responsibility for the program of the 52nd Annual Congress on Medical Education and Licensure which brought together the largest group of medical educators and practitioners ever to attend such a program.

Matters Referred to the Council by the House of Delegates

At the December, 1955, meeting the Reference Committee on Insurance and General Practice reviewed Resolution No. 28 on General Practice introduced by Dr. Kenneth C. Sawyer of Colorado. This resolution directed the Council on Medical Education and Hospitals to stimulate the formation of general practice departments in medical schools, to develop and utilize means to implement, improve, and extend the two-year general practice internship-residency program and that the Council also be instructed to implement the policy approving staff rules of hospitals permitting generalist staff privileges in the departments of medicine, pediatrics, obstetrics, and surgery in accordance with demonstrated professional competence and experience. This resolution with three others, Nos. 11, 12, and 20, dealing with the same subject were presented in the form of a substitute resolution which set up a Continuing Committee on Medical Practice to conduct studies in this over-all area. The Council on Medical Education and Hospitals has cooperated with the Council on Medical Service in furnishing background material for this committee and staff members have also met with the committee at its request and will assist in further studies as indicated.

Resolution No. 33 introduced in December, 1955, by Dr. J. M. Kolb of Arkansas requested that the American Medical Association through its Council on Medical Education and Hospitals encourage hospital staff rules which permit the general practitioner staff member privileges in the specialty departments in keeping with his merit and demonstrated ability. The reference committee indicated its agreement with the intent of the resolution and its adoption. The Council on Medical Education and Hospitals has long been in agreement with the intent of the resolution. It recognizes, however, that staff appointments are the concern of the medical staff, administration, and board of trustees of the individual hospitals and that, although it can advise, the final determination of policies falls within the jurisdiction of the hospital administrative mechanism. The Council wishes to point out that it endeavors even in its "Essentials of Approved Residencies and Fellowships" to indicate that "the particular specialties in which residents are being trained should be represented in the staff by *well qualified, experienced and proficient physicians, whether or not they hold membership in special societies and colleges or are certified in their specialty.*"

At the June meeting in 1956 resolutions No. 11 and 38 were considered together by the Reference Committee on Medical Education and Hospitals because they both dealt with the type of internship which may provide the best background for medical practice. The reference committee indicated its belief that there is a growing body of opinion within the profession in favor of the rotating internship, but also recognized the educational merits of the 10% of all internships classified as "straight" services. The House of Delegates adopted the substitute resolution that the Council on Medical Education and Hospitals increase its efforts to encourage rotating internships rather than straight internships in all of the hospitals approved for the latter, and that a report of these efforts be submitted annually. The Council wishes to indicate that in its "Essentials of an Approved Internship" it is stated that "It is the opinion of the Council that the best general, basic education is provided by a well organized and conducted rotating internship." Furthermore the Council indicates that many states require a rotating internship as a prerequisite for licensure. In another section of this annual report the Council presents an analysis of the internship situation over the past six years. It will be noted that the total number of all internships has increased over this period, and that the relationship of straight and rotating internships has remained essentially the same with approximately 10% of the former and 88 to 89% of the latter.

The Council wishes to indicate that it recognizes the importance of "flexibility and judgment in the application of any set of standards to a particular local situation," as was recommended by the reference committee in reporting on Resolution No. 32 at the June, 1956, meeting, and that it endeavors to conduct its survey and evaluation activities in keeping with such philosophy.

Resolution No. 12 concerning schools of inhalation therapy and the development of essentials for such schools was referred to the Council on Medical Education and Hospitals in June, 1956. Currently the staff of the Council is engaged in the collection of background information. A report on this will be made at a later date.

Resolution No. 34 pertaining to lectures on medical ethics and related matters was brought to the attention of the Council at the June, 1956, meeting. The Council wishes to indicate that in its 55th Annual Report on Medical Education in the United States and Canada (1955) it presented the findings of a questionnaire inquiry on the teaching in medical schools of legal medicine, medical ethics, medical economics, medical public relations, and medical history. All but six of the four-year schools were reported to be conducting lectures on medical ethics and related matters. Through editorials, conferences, and communications with the schools the Council has endeavored to stress the importance of basic instruction in medical ethics, and it will continue to do so. It will also encourage medical schools to seek the cooperation of the county and state medical societies in basic indoctrination in medical ethics for medical students and recent medical graduates.

Following adoption by the House of Delegates in December, 1955, of the recommendation for revision of the "Essentials of An Approved Internship," the publication of the revised material has been authorized and distribution made.

In cooperation with the Council on Medical Service, the Council on Medical Education and Hospitals presented a preliminary report on the study of the private practice activities of full-time faculty personnel at the meeting of the Congress on Medical Education and Licensure in February, 1956. Subsequently when the House of Delegates adopted the final report of the Council on Medical Service and its recommendations at the June, 1956, meeting the Council on Medical Education and Hospitals has undertaken to present this material in full to medical schools through the medium of the 56th Annual Report on Medical Education in the United States and Canada scheduled for publication on Aug. 25, 1956.

In 1954 several resolutions dealing with problems presented by graduates of foreign medical schools were presented to the House of Delegates and it also received a report of a special committee of the Board of Trustees on the same subject. The problem of further study in this area was referred to the Council on Medical Education and Hospitals. Over the succeeding two-year period the Council spearheaded the organization of the Cooperating Committee on Graduates of Foreign Medical Schools with interval reports to the Board of Trustees. This study culminated in the recommendation for the establishment of an "Evaluation Service for Foreign Medical Graduates," a resumé of which was reported to the House of Delegates for action in June, 1956. The House of Delegates at that time approved the principle of establishing a separate organization to evaluate the medical qualifications of foreign-trained physicians seeking further training in United States hospitals. The Association of American Medical Colleges, the American Hospital Association, and the Federation of State Medical Boards of the United States also approved this principle. Subsequent to the action of the House the "Evaluation Service for Foreign Medical Graduates was organized under the Not-for-Profit Act of the State of Illinois. Each of the parent organizations named two representatives to serve as the board of trustees of the new evaluation sevice. The organization is now under way, and it is anticipated that it may be in operation by the latter half of 1957.

Medical School Accreditation

During the academic year 1955-1956, medical schools at the following institutions were surveyed by representatives of the Council on Medical Education and Hospitals and the Association of American Medical Colleges:

State University of New York, Syracuse
University of Miami
University of South Dakota
University of Maryland
Tulane University
Jefferson Medical College
University of Nebraska
Cornell University
Dartmouth Medical College
McGill University
University of Missouri
University of Vermont
Queen's University
University of Alberta
University of Mississippi

The educational programs in all instances were approved by the Council on Medical Education and Hospitals and the institutions granted membership in the Association of American Medical Colleges. Approval of the School of Medicine of the University of Miami increased the number of approved medical schools with full four-year programs to 76, since at the time of the survey, the School of Medicine at Miami had its four-year program in effect for the first time.

During the academic year 1956-57 liaison visits have been provisionally scheduled for the following medical schools:

Hahnemann, Philadelphia
University of Pittsburgh
University of Buffalo
Albert Einstein College of Medicine
Seton Hall University
Temple University
University of Mississippi
Medical College of Georgia
University of Miami
Albany Medical College
University of Florida
University of Missouri
St. Louis University
Laval University
University of Saskatchewan
Johns Hopkins University

Such provisional scheduling is subject to revision if circumstances so warrant.

The medical schools at the University of Mississippi and the University of Missouri during this year will have four-year programs in effect and if approved will increase the number of approved four-year medical schools in the United States to 78. Both of these institutions have expanded from two-year schools of basic medical sciences. The visits to Seton Hall College of Medicine and the College of Medicine at the University of Florida will be coincident with the implementation of the first-year course of instruction in these newly developing schools.

For a detailed report on the status of medical education in the United States and Canada, delegates of the House are respectfully referred to the Annual Report on Medical Education of the Council on Medical Education and Hospitals in the Aug. 25, 1956, issue of THE JOURNAL.

At the Boston meeting of the Liaison Committee on Medical Education it was voted that a policy be established of making liaison visits to newly developing medical schools annually so as to be in a position to express opinion to the school authorities and to the two Councils as to the merits of the program being formulated. At the previous meeting the Liaison Committee on Medical Education had concurred in recommendations of the two Councils for provisional approval of the first two years of a newly developing medical school program if findings warrant such action.

Congress on Medical Education and Licensure

The 52nd Annual Congress on Medical Education and Licensure held Feb. 11 to 14, 1956, at the Palmer House in Chicago was attended by nearly 1,000 registrants, making it by a considerable margin the largest group ever to attend such a session. The first day of the Congress was devoted to a Conference on Graduate Medical Education co-sponsored with the Advisory Board for Medical Specialties. This program dealing with the current problems in residency training, organization and administration, and basic science content elicited an interesting and lively audience participation. The second day was devoted to special meetings of the Advisory Board for Medical Specialties and the Federation of State Medical Boards of the United States. One-half day of the regular Council program in the third day was devoted to a report on "Trends in Specializations" and to the problems related to clinical faculty appointments and the private practice of medicine. At this session, which was co-sponsored by the Council on Medical Service, the preliminary findings of the survey and study being made on this problem were presented. Spokesmen for medical schools and for the medical profession subsequently presented their respective viewpoints, and discussion from the floor ensued. The Congress also heard presentations on the search for better ways in medical education and reports on a number of experimental approaches being made in medical schools. The final day of the Congress was devoted to the activities of the Federation of State Medical Boards.

Standing and Special Committees

The Council has numerous standing and special committees assigned to specific functions engaged individually or in cooperation with organizations concerned with certain areas of its activity. Each committee includes both Council and staff personnel and makes studies, reports, and recommendations to the Council for appropriate action.

STANDING COMMITTEES

Liaison Committee on Medical Education, which cooperates closely with the Executive Council of the Association of American Medical Colleges.

Liaison Committee with the Advisory Board for Medical Specialties, which concerns itself with matters of mutual interest to the Council and the various specialty boards.

Committee on Essentials, which is responsible for review, revision, and recommendations regarding the essentials underlying the numerous programs involving approval or accreditation in which the Council is engaged.

Liaison Committee with the American Hospital Association's Council on Professional Practices in areas concerned with specialists in allied fields (technical, etc.).

SPECIAL COMMITTEES

Ad Hoc Advisory Committee on Postgraduate Medical Education, which is studying the basis for development of "guides" to institutions and organizations developing programs in this area.

Committee on Foreign Medical Credentials, which cooperated in the development of the Cooperating Committee on Graduates of Foreign Medical Schools and in the establishment of the Evaluation Service for Foreign Medical Graduates.

Committee on Licensure, which cooperates with the Federation of State Medical Boards, and the Association of American Medical Colleges in problems of licensure as related to medical education.

Joint Committee on Medical Education in Time of National Emergency, composed of representatives of the Council and the Association of American Medical Colleges in cooperation with the Armed Forces Medical Services, Selective Service System, United States Public Health Service, and other government agencies in matters involving undergraduate and graduate medical education.

Internship Review Committee, which studies and evaluates internship programs and recommends action regarding approval to the Council.

Residency Review Committees and Conference Committees. These have been developed for the cooperative evaluation of residency training programs with representatives in each instance from the Council, the individual specialty board concerned, and certain specialty colleges such as the American College of Surgeons and the American College of Physicians. Currently there are 16 active committees of this nature meeting from one to three times annually. Up to the present time there are still no such committees for anesthesiology, obstetrics and gynecology, pathology, or thoracic surgery.

The Council also actively participates with other organizations in areas closely related with or impinging on the field of medical education, such as:

Joint Commission on Accreditation of Hospitals
National Internship Matching Program
American Medical Education Foundation
National Fund for Medical Education (Advisory Council)
National Board of Medical Examiners
Federation of State Medical Boards of the United States
Selective Service System
Education and Training Division, Surgeon General's Office, Department of the Army

The Council and its staff members collaborate with many other organizations and agencies with interest in one or more phases of medical education. Cooperation and effective intercommunication between the Council and these other groups directed toward mutual understanding and collaboration is one of the most demanding functions of the Council in terms of time, energy, and basic significance.

Graduate Medical Education

Several years ago the Council on Medical Education and Hospitals developed the basis for cooperation with specialty groups and organizations in this increasingly important field of medical education. Acting through committees set up in cooperation with these other groups the Council, in line with policies determined by it and the House of Delegates of the American Medical Association, is responsible for establishing standards of training in internship and residencies. It conducts a year-round hospital inspection program related to the educational activities of the hospital in these graduate areas. The Council subsequently develops the listing of hospitals in which internship and residency programs meeting the criteria established through the cooperative mechanism indicated are being conducted.

The staff of the Council, through conferences and correspondence, endeavors to provide consultative services to the medical staff and administrators of hospitals developing new programs or reorganizing previously established ones. In order to conduct this program in the area of graduate medical education the Council maintains liaison with all of the American Boards in the medical specialties and with the Advisory Board for Medical Specialties. In addition there is close liaison with the American Academy of General Practice, the American College of Physicians, the American College of Surgeons, the National Intern Matching Program, and many other agencies concerned with medical education at the graduate level. One of the important aspects of the Council's work in this area is the preparation of the Annual Report on Internships and Residencies for presentation in one of the fall issues of THE JOURNAL and the Residency Information Bulletin which appears at intervals of four months. The Council staff also revises and prepares for publication the various "Essentials" of programs in internship and residency education and training as approved and authorized by the Council and House of Delegates.

Internships

The Internship Section is responsible for the compilation of data regarding approved intern training programs which are presented in the Internship and Residency number of THE JOURNAL of the American Medical Association as the Annual Report on Internships and Residencies. It includes statistical data and other specific information on all hospitals approved by the Council for the training of interns. All other activities regarding the intern training programs for which the Council is responsible are handled in this section. The assistant secretary in charge acts as secretary of the Internship Review Committee.

The section works closely with the National Intern Matching Program, collaborating with the Program in the correlation of its activities with those of the internship programs of the Council.

The revised Essentials of an Approved Internship, in which were incorporated the recommendations made by the *Ad Hoc* Committee on Internships, were presented to the House of Delegates by the Council in December, 1955, and were adopted. The major changes included in the revision were:

1. The "one-fourth rule"
2. Reinstatement of the straight internship in pathology
3. The emphasizing of the educational aspects as being the primary aim of the internship

A copy of the revised Essentials was sent to each hospital administrator and intern committee chairman in all hospitals approved for the training of interns early in January, 1956. The covering letter called attention to the "one-fourth rule." Since a number of inquiries were received by the Council regarding this rule, in May, 1956, a letter concerning its interpretation and application was sent to the administrator and the intern committee chairman in all hospitals approved for internships.

Two resolutions, Nos. 11 and 38, were introduced into the House of Delegates at the June, 1956, Annual Meeting favoring the rotating internship. The Reference Committee on Medical Education and Hospitals considered these resolutions and reported as follows:

"Your reference committee believes that there is a growing body of opinion within the profession in favor of a rotating internship. It also recognizes the difficulties involved and the dangers to some established educational programs were action taken precipitously to disapprove straight internships, which are about 10% of the total number now approved. It recommends the following substitute resolution for resolutions 11 and 39:

Resolved, (1) That the Council on Medical Education and Hospitals be requested to increase its efforts to encourage rotating internships rather than straight internships in all hospitals approved for the latter; and (2) that a report of the results of this effort be submitted annually."

This portion of the reference committee's report was adopted by the House of Delegates.

At this time, straight internships are approved in medicine, surgery, pediatrics, pathology, and obsetrics-gynecology. In December, 1952, the House adopted the revised Essentials of an Approved Internship, which limited approval of straight internships to medicine, surgery, and pediatrics. Approval for straight internships in pathology was reinstated by the House in December. 1955. The effective date of discontinuation of straight internships in obstetrics-gynecology is June 30, 1957.

A recapitulation of statistical data for the past five years regarding internships by type of service and also straight internships appears in the accompanying table. These data are self-explanatory. It should be noted that during the past three years, 1953-1954-1955, while the number of internships of the rotating and straight types have both increased, the relative proportion between rotating and straight internships has remained constant—for this period, 89% of the total internships have been rotating, 10% straight.

Internship Review Committee

The Internship Review Committee was organized in 1954 and is composed of representatives of organizations actively concerned with and interested in intern training programs. In addition to the representatives of the Council, there is a representative from the Association of American Medical Colleges, the American Hospital Association, the Federation of State Medical Boards of the United States, and the American Academy of General Practice. The Committee acts in an advisory capacity to the Council in recommending approval or disapproval of new and currently approved intern training programs. It is responsible for evaluating the adequacy of internship programs on the basis of the reports of the Council's field representatives and the data submitted by the hospitals. The Committee also acts in a recommendatory capacity on matters of intern training requirements and associated policy.

In its brief period of operation, the Committee has become increasingly aware of the necesity for reasonable flexity in the interpretation of the requirements for internship approval, and of the advisability of giving a hospital an opportunity to improve its deficient program before approval is withdrawn. When a hospital does not measure up to the requirements, it is warned that its approvad status is in jeopardy and advised regarding the specific deficiencies noted at the time of inspection. Sufficient time for correction of these deficiencies is permitted before approval is actually withdrawn. This policy serves to emphasize the consultant attitude of the Committee and of the Council in regard to training programs.

The Committee is functioning effectively and is filling a real need in its work. It is continually working toward the objective of maintaining and elevating the standards of intern education.

National Intern Matching Program

The National Intern Matching Program has completed five years of successful operation as the agency through which medical school graduates receive appointments as interns in hospitals approved for such training by the Council on Medical Education and Hospitals. The primary function of the Program is to serve as a central clearing agency for medical students and hospitals; its aim is to provide an orderly method for giving effect to students' preferences regarding hospitals and hospitals' choice of students in the appointment of interns. This mechanical plan of matching interns and hospitals has proved more efficient than any other plan previously used, and gives complete freedom of choice to both students and hospitals.

The policies under which the program operates are determined by organizations interested in internships. In addition to the Council on Medical Education and Hospitals, these organizations are the American Hospital Association, the Association of American Medical Colleges, the American Protestant Hospital Association, the Catholic Hospital Association, and the Student American Medical Association. The policy-making body of the National Intern Matching Program is composed of representatives from these groups, liaison representatives from the federal services and a student representative.

Hospitals eligible to participate in the program must be approved by the Council on Medical Education and Hospitals. Students eligible to join the program are those seeking first year internships in these hospitals. Each student is provided with a Directory of Participating Hospitals, each hospital receives a Directory of Participating Students. Students apply where they wish, to as many hospitals as they desire. Hospitals are free to interview any participating student and use their own interview and evaluation techniques. Upon completion of interviews, each student submits to the Program office a ranking list showing the hospitals to which he has applied in order of preference. Hospitals also submit ranking lists of students who have applied to them. These lists, together with the intern quotas for each hospital, form the basis of the matching operation. Hospitals are matched with those students ranked highest on their list to the limit of their quota, unless those students prefer another hospital which also has given them a high ranking. Thus each student receives the highest choice hospital on his list that has a place for him. It is the individual responsibility of student and hospital to determine what will be acceptable to them prior to submitting ranking lists. The Program covers internships beginning between April 1 and Dec. 31. Lists are received by the National Intern Matching Program in January; the actual matching begins in February; and results are announced the middle of March.

Participation in the fifth program, completed in March, 1956, included 98% of all hospitals approved by the Council, and 97% of all United States medical school seniors. Of the 6,821 students in the program, 6,588 (97%) were matched. Of the 233 unmatched students, more than 100 applied to only one or two hospitals, thereby reducing their chances of being matched. Of the students matched, 74% received their first choice, 15% their second choice, 6% their third choice, and 5% their fourth choice, or lower. A total of 11,459 positions were offered by the 821 participating hospitals. Seventeen per cent of these hospitals completely filled their quotas, 53% partially filled, and 30% had no interns matched to them. During the past year, hospital and student participation was at the highest level in the history of the program. Indications are that participation in the Program for 1957-1958 will equal and probably surpass previous years.

Residency Review Committees

Since last year's report, no new residency review committees have been established. The Residency Review Committee for Plastic Surgery has been added to the group with tripartite representation, and members representing the American College of Surgeons have been appointed. The other committees in which the American College of Surgeons is represented are the Conference Committee on Graduate Training in Surgery, and the Residency Review Committee for Otolaryngology. The American College of Physicians is represented on the Residency Review Committee for Internal Medicine. The work of the 16 committees has continued successfully for the past year, with the complete support of the Council.

Increasingly in recent years, attention and thought have been given to full training requirements by physicians who develop and direct residency programs in hospitals, and the examining boards in medical specialties, colleges, and Council which participate in residency approvals. The Council and the organizations with which it cooperates in approval of graduate training programs have been particularly concerned with the question of how a resident, upon entering a training period of several years' duration, can be assured of continuity in supervision and increasing, graded responsibility. As a result of these considerations, residency review committees in several specialties have adopted policies intended to encourage educational continuity. The same principle is applicable in all of these policies, namely, that hospitals to qualify for continued approval are required to provide "full training" in the specialty, either independently or in collaboration with other hospitals through integration of their programs. Approval for residency training in anesthesiology, general surgery, otolaryngology, plastic surgery, as well as medical subspecialties (allergy, cardiovascular diseases, gastroenterology, and pulmonary diseases) has for some time been limited to hospitals offering full training, either independently or in collaboration with other hospitals. Announcement of adoption of this policy relating to residency programs in pediatrics appeared in the April 10, 1954, issue of The Journal. Similar statements relating to residency programs in orthopedic surgery, radiology, and urology were published in The Journal issue of Sept. 24, 1955. In the issue of Sept. 20, 1956, there is an announcement on the future policy relative to approval of residency training in ophthalmology.

These policies have been adopted to preclude the possibility of a resident taking his training in two or three isolated programs with no assurance of continuity of supervised experience or progression of responsibility. As in the past, hospitals that offer residencies in these specialties afford residents a training period which varies in length. However, these hospitals provide this period of training as a part of a coordinated and integrated educational experience. The Council supports the principle of educational continuity in full training programs as eminently sound.

Hospitals and Technical Schools

A summarization of inspections of hospitals and technical schools made by the Council during the period July 1, 1955, through June 30, 1956, is as follows:

Accreditation only (Joint Commission)	93
Intern training	67
Residency training	386
Intern and residency training	263
Technical schools	4
Total	813
Intern programs reviewed	330
Residency training programs reviewed	2,291
Joint Commission surveys	451
Total	3,072

The figures quoted below indicate the number of hospitals approved for intern and resident training, the number of approved programs, and the number of approved technical schools on July 1, 1955 and June 30, 1956:

	Approved July 1, 1955	Approved June 30, 1956
Hospitals offering intern training programs	865	862
Hospitals offering residency training programs	1,194	1,211
Programs of intern training	1,080	1,085
Programs of residency training	4,912	5,186
Technical Schools		
Medical Record Librarian	25	29
Medical Record Technician	7	8
Medical Technology	595	618
Occupational Therapy	29	30
Physical Therapy	35	37
X-Ray Technology	422	456

Joint Commission on Accreditation of Hospitals

Since the establishment of the Joint Commission on Accreditation of Hospitals, members of the field staff of the Council have served in a dual capacity in their visits to hospitals. As Council representatives they surveyed and reported on graduate educational programs, and as Joint Commission representatives they surveyed and reported on the hospitals for purposes of accreditation. This dual responsibility has at times given rise to some difficulties which have tended to decrease with the passage of time and increased experience of surveyors. In its report to the House of Delegates the Stover Committee, which studied the Joint Commission, has recommended that in the future the Joint Commission have its own staff of surveyors and that Council field staff restrict their activities to survey and evaluation of graduate educational programs. The House of Delegates has accepted the Stover Committee report, and the problem of implementing changes in field staff functions will be determined on arrangements made by the Board of Trustees in financing certain field staff personnel for the Joint Commission. It is anticipated that discontinuance of the dual responsibility of Council field staff will make it possible to cover survey activities in graduate education with about two-thirds of the personnel now engaged in Council field work.

Hospital Survey Program

The Council had nine full-time positions for physicians as field representatives at the close of the fiscal year. These field representatives are carefully selected on the basis of their interest in this field of education; their knowledge and experience; and their ability to represent the Council with firmness, tact, and diplomacy in problem situations. They are not a policing body in any sense of the word, but act in the capacity of consultants to hospital staffs in understanding and analyzing their problems, and in assisting them to elevate the standards of graduate medical training. The responsibility for reviewing programs of intern and resident training requires an intelligent and constructive approach; the approval program of the Council depends to a large extent on the efficiency and effectiveness with which its representatives carry out their obligations.

Eight of the nine positions were filled on June 30, 1956. During the year July 1, 1955, through June 30, 1956, 809 hospitals were visited, an average of 7.7 hospitals per man per month. Last year the figure was 7.5 hospitals per man per month. The field representative frequently acts in a dual capacity, evaluating the internship and residency programs for the Council and completing a survey for the Joint Commission on Accreditation of Hospitals. The Joint Commission is concerned primarily with the organizational and administrative aspects of the hospital, and with the professional activities of the medical staff. When the field representative surveys a hospital for the Joint Commission, approximately one-half of his time is spent in making this survey. Each field representative is assigned a definite territory, which includes about 150 hospitals approved for graduate training, and is responsible for the evaluation of these training programs at least once every two or three years. During the current reporting period, July 1, 1955, through June 30, 1956, 451 surveys were conducted for the Joint Commission; 330 internship programs and 2,291 residency programs were surveyed.

The Council sincerely appreciates the untiring efforts of this group of physicians to elevate the standards of medical education, and acknowledges the invaluable contribution in making the program successful.

TECHNICAL SCHOOLS

The Council collaborates with a number of organizations in the development of standards for and approval of technical schools for the following personnel: medical record librarians, medical record technicians, medical technologists, occupational therapists, physical therapists, and x-ray technicians. During the past year, the House adopted revisions for the standards in the fields of physical therapy and x-ray technology. The Council has revised and implemented resurvey precedures in order to assure more thorough periodic evaluation of schools in all areas and the Advisory Committee on Physical Therapy Education approved by the House in December, 1955, has been activated. Resurveys of approved schools of medical technology and x-ray technology are currently being carried out by pathologists and radiologists appointed by the Council's advisory groups in these two areas. Joint physician-therapist team surveys are being projected for the other areas. An assistant secretary coordinates the Council's activities on technical schools. He is also responsible for the staff work on any matters referred to the Council relating to personnel in the paramedical fields whose services at the professional and technical level contribute to the care of the patient.

REVISION OF ESSENTIALS

In cooperation with other interested organizations, the Council has prepared a revision of three sections of the Essentials of Approved Residencies and Fellowships, and suggests that the House of Delegates consider their adoption. These revised Essentials are presented in Appendix A to this report. The specialties involved are preventive medicine and radiology. The American Board of Preventive Medicine now certifies in three fields—aviation medicine, occupational medicine, and public health. The proposed revision incorporates requirements for residency training in these fields. The essentials for training in radiology have been broadened to include the use of radioactive substances and isotopes, and the quantitative requirements with respect to radium treatments have been reduced from 100 to 25, exclusive of intrauterine applications. The essentials now recommend that clinical training in radiotherapy be at least one year, whereas previously six months was indicated for radiotherapy training.

The essentials in preventive medicine and radiology are presented in their entirety.

CHANGES IN ORGANIZATION AND STAFF

In November, 1955, Dr. Glen R. Shepherd, who had been assistant to the dean at the University of Kansas School of Medicine, joined the staff as assistant secretary with a specific assignment in the area of postgraduate medical education. Dr. David Robinson and Dr. John Lund resigned from the field staff during the course of the year. On July 1, 1956, Dr. Edward H. Leveroos, Director of the Division of Hospitals and Graduate Education, who had served the Council on Medical Education and Hospitals over eight years, resigned to become Director of the Ochsner Foundation Hospital. The resignation of Dr. Leveroos has necessitated some reorganization of the Council staff so as to coordinate more closely the various areas of medical education with which it deals. Dr. Walter S. Wiggins, as associate secretary of the Council, has been delegated direct supervision of activities in relation to undergraduate medical education. The Council secretary is assuming more direct supervision of graduate medical education. Dr. Arthur N. Springall as assistant secretary has direct responsibility for the internship activities and the detail programming of the field staff activities. Dr. John Hinman as assistant secretary is directly in charge of paramedical activities. Drs. Springall, Hinman, Thompson, and Freese have each been assigned part-time activities in relation with Residency Review and Conference Committee functions of the Council. Dr. Walter B. Seelye, formerly professor of pediatrics at the University of Washington School of Medicine, will join the field staff in October, 1956. His experience in private practice and in teaching and administration give him an unusual background for this activity. Further staff reorganization will be undertaken as the relations of the Council's staff to the Joint Commission are adjusted.

Council Publications

The Council has been responsible for preparation of material of major importance for several issues of THE JOURNAL on the following subjects:

Medical Licensure Statistics (1955)	May 26, 1956
Postgraduate Courses for Physicians (September 1, 1956 to August 31, 1957)	July 28, 1956
Medical Education in the United States and Canada	Aug. 25, 1956
Directory and Annual Report of Approved Internships and Residencies	Sept. 22, 1956

In addition, members of the Council staff have prepared special articles and editorials for THE JOURNAL. It will be noted that the Council prepared a single comprehensive listing of postgraduate courses for physicians for the entire year in place of the semi-annual listings presented in the past. The transfer of printing from headquarters in Chicago to Dayton, Ohio, after the schedule for special numbers had been completed early in the year placed the Council staff under great pressure to meet the new prepublication deadlines. Readjustment of publication dates of the listing of postgraduate courses and the annual report on medical education will be requested for next year so as to facilitate cooperation with those furnishing data and to allow the staff to prepare their reports under less pressure.

The Council also prepares a number of other publications all of which have a wide distribution, and which necessitate regular revision. These include the following pamphlets:

Colleges of Arts and Sciences Approved by Regional Accrediting Agencies
Choice of a Medical School
Licensure of Foreign Medical Graduates
Foreign Medical Schools
Essentials of an Acceptable Medical School
Essentials of Approved Examining Boards in Specialties
Essentials of an Approved Internship
Report of the Advisory Committee on Internships
Essentials of Approved Residencies and Fellowships
Essentials for the Training of Medical Record Technicians
Essentials of an Acceptable School for X-Ray Technicians
Approved Schools of Physical Therapy
Essentials of an Acceptable School for Medical Technologists
Essentials of an Acceptable School of Occupational Therapy
Hospital Medical Library Suggestions
A History of the Council
Relation of Physicians and Hospitals
Residency Information Bulletin

The task of *maintaining* adequate revision of these various publications is an important part of the work of the Council staff. The staff is also responsible for the weekly listing in The Journal of scheduled examinations and reciprocity meetings of state licensing boards, basic science boards, examining boards in the medical specialties, etc. When indicated, statements are also prepared concerning current Council action for publication in The Journal.

Development and Needs

From the date of initial organization of the Council on Medical Education and Hospitals the secretary has actively participated in the survey of medical schools. This has necessitated long periods of absence from the headquarters office in the conduct of such surveys. During recent years the activities and responsibilities of the Council have materially increased in all areas of medical education and particularly in the field of postgraduate medical education. In order to coordinate more effectively the work of the Council in the over-all field of medical education, it is desirable that the secretary give essentially full time to administration and supervision of its activities at headquarters and markedly reduce or eliminate participation in medical school surveys. In planning the program of the Council for the next year efforts will be made to readjust schedules so that the above objectives may eventually be attained. It will necessitate the appointment of at least one additional staff member who will primarily be assigned to the undergraduate educational program evaluation.

The studies now underway directed toward the development of "guides" in the field of postgraduate medical education will necessitate adequate financing for the costs involved in meetings of the *Ad Hoc* Advisory Committee appointed to accomplish this purpose.

In the reorganization of the field staff subsequent to implementation of the report of the Stover Committee on the Joint Commission for Accreditation of Hospitals there will be a reduction of the number of personnel evaluating internships and residencies for the Council. It is understood that the equivalent of the costs of maintaining at least three field staff personnel will be transferred by the American Medical Association to the Joint Commission on Accreditation of Hospitals with Council budget reduced accordingly. Rising costs in maintenance of field staff personnel and the need for augmented salaries to attract fully qualified individuals into this type of work necessitated re-evaluation and augmentation of budget factors in support of this work for the field staff retained by the Council and in estimation of the sum to be transferred from the American Medical Association to the Joint Commission on Accreditation of Hospitals in the support of such personnel.

Appreciation

The Council on Medical Education and Hospitals wishes to express its sincere appreciation to Dr. Edward H. Leveroos for his contribution to the field of graduate medical education during his period of over eight years as a staff member. The current development of the program of internship and residency training evaluation and the cooperative mechanism set up between the Council and the various specialty groups was achieved largely through the efforts of Dr. Leveroos. The Council also expresses appreciation to those members of the field staff who left the Council's service for the efforts and contribution made during their period of employment.

The Council, furthermore, wishes to express sincere appreciation of the support, encouragement, and cooperation it has received from the officers, Board of Trustees, members of the House of Delegates, and other councils and bureaus of the American Medical Association, and the collaboration of the various organizations and agencies with which it has worked during the past year.

Respectfully submitted,

H. G. Weiskotten, Chairman.
Victor Johnson, Vice-Chairman.
W. Andrew Bunten.
Guy A. Caldwell.
John W. Cline.
Harlan English
James M. Faulkner.
Leland S. McKittrick.
Franklin D. Murphy.
Charles T. Stone.
Edward L. Turner, Secretary.

Appendix A

Essentials of Approved Residencies and Fellowships

(Current edition revised to December, 1955; originally published in The Journal, March 24, 1928, page 922. Proposed revision recommended for approval by action of the Council on Medical Education and Hospitals, Feb. 9 and June 9, 1956.)

1. Preventive Medicine

This revision is made necessary by the following facts: At the time of the last revision of the Essentials of Approved Residencies and Fellowships, requirements for residencies in Preventive Medicine and Public Health, and in Occupational Medicine were set out. Since then, the title of the American Board of Preventive Medicine and Public Health has been changed to the American Board of Preventive Medicine and the Board certifies in three fields—Aviation Medicine, Occupational Medicine, and Public Health. Accordingly, new Essentials have been prepared for Aviation Medicine; the Essentials for Occupational Medicine have been modified slightly, and new paragraphs as to eligibility of applicants and board requirements have been added since at the time of the revision of the Essentials currently in effect there was no board certification in this field; the Essentials for Preventive Medicine and Public Health remain unchanged for the most part except that they are now for Public Health only, and the form has been changed slightly so that it will be similar to that of Aviation Medicine and Occupational Medicine.

It is proposed that the following section be included in the next revision of the Essentials of Approved Residencies and Fellowships:

PREVENTIVE MEDICINE

Residencies in Preventive Medicine are approved by the Council on Medical Education and Hospitals and the American Board of Preventive Medicine in three fields: Aviation Medicine, Occupational Medicine and Public Health. Residency programs in these fields ordinarily include an academic phase such as that offered in a school of public health or of occupational medicine, and an additional year or two of practical training. While the provisions of the section on "General Requirements" (pages 6-17 of the current essentials) are not directly pertinent to residencies in Preventive Medicine, relating as they do more specifically to the clinical specialties, the principles underlying them do apply to programs in all three fields of Preventive Medicine.

AVIATION MEDICINE

A residency in Aviation Medicine should be of one or more years' duration and should include training and experience in the following areas: Selection and care of flying personnel, flying safety including accident prevention and investigation, human engineering as related to aircraft and aircraft equipment design, the principles of aero transportation of the sick including contraindications, necessary precautions and essential equipment for such transportation, and the maintenance of an efficient system of records, and industrial or occupational aspects of Preventive Medicine, such as toxicological and mechanical hazards and other related areas.

The agency responsible for residency training may be either a governmental or a civilian organization or institution. It should be responsible for the maintenance of the health of a sufficiently large number of flying and ground maintenance personnel to provide the residents with the broad experience in the various phases of the specialty. There should be a sufficient amount and variety of aeronautical equipment available to enable the resident to familiarize himself with its use. A well staffed hospital to which Aviation Medicine clinical problems are referred should be available. If not, such training should be provided through affiliation. Experience in the examination, care and management of ambulatory patients should be provided through the facilities of an adequately staffed and well equipped outpatient department. The agency should have access to an adequately equipped laboratory in which studies on problems relating to aircraft accidents and hazards of flight can be carried out.

Residency training in the specialty should be under the direction of a qualified physician trained in Aviation Medicine. His professional qualifications should meet the standards required of the staff of institutions approved for residency training in other specialties (General Requirements, paragraph 1, Section 1, page 6 of current essentials). His staff should include a sufficient number of personnel trained not only in Aviation Medicine but also in related medical fields to offer a comprehensive training in the specialty.

The training program should include instruction and experience in the preventive and clinical aspects of Aviation Medicine and closely related fields. The program should provide experience in the planning, administration and supervision of health programs for both flying and ground maintenance personnel. An opportunity should be given the resident to participate in the investigation of aircraft accidents and to conduct studies on problems relating to the proficiency of flying personnel. The resident's hospital and outpatient experience should afford him an opportunity to study and treat conditions which are common in flying and ground crew personnel. Emphasis should be placed on the resident's responsibility for the care and treatment of inpatients having conditions peculiar to flight. Adequate opportunities must be provided for the residents to engage in flying activities with the flying personnel for whose medical care they are responsible.

Eligibility of Applicants. In addition to the qualifications required for applicants in the other specialties (General Requirements, paragraph 6, Section 1, page 10 of current essentials), the applicant for an appointment to an approved residency in Aviation Medicine should have completed at least two academic years of graduate study in Preventive Medicine and Aviation Medicine; or training and study deemed by the American Board of Preventive Medicine to be substantially equivalent to such graduate study.

Board Requirements. Candidates for examination in Aviation Medicine must meet the general requirements of the American Board of Preventive Medicine, in that they complete a year of internship in an approved hospital and at least six additional years of training and experience in aviation medicine.

One of these years must have been devoted to graduate study leading to a degree of Master of Public Health or its equivalent in an approved school of Public Health (or other similar training and study satisfactory to the Board). Another year must have been spent in graduate education in Aviation Medicine or in a closely related field acceptable to the Board.

At least one of the remaining four years must have been in an approved Aviation Medicine residency program. The remaining years must have been limited to the practice of Aviation Medicine preferably under the supervision of a well qualified specialist in that field.

OCCUPATIONAL MEDICINE

Residencies in Occupational Medicine, as a specialized branch of Preventive Medicine, should include training in the principal divisions of Preventive Medicine and Public Health, such as administration, health education, epidemiology (control of communicable and degenerative diseases), accident prevention and sanitation. The training should not neglect the broad problems of community health, but should emphasize their relation to the industrial population as an important part of the general population and to occupational hazards and disease.

The training period comprises a period of specialized training of two to three years' duration, not less than one year of which is carried out in supervised practice in an industrial medical organization. Ordinarily these programs should be conducted under the sponsorship of an educational institution. They may be organized in a school of medicine, a school of public health or an associated graduate school, in which the facilities of a university as a whole are available for intramural instruction. Extramural training should be provided by an organization affiliated with the educational institution, and having a satisfactory medical service. The intramural and extramural phases may be carried on simultaneously or as separate periods.

I. *Content of Intramural Training Program*

A. *Basic disciplines.* The basic disciplines may vary in their content to some degree (and in their emphasis on matters of general importance in the field of preventive medicine and of special significance to the industrial physician) in accordance with the availability of facilities for instruction in various institutions of learning. Courses should be offered to include the following:

1. Preventive Medicine as it relates to community health generally, rather than to industrial health specifically, includes microbiology, control of communicable diseases and their transmission, and various aspects of administrative medicine.

2. Industrial health practice which concerns itself with the medical problems and practices of industry, as well as other activities of the industrial physician in his professional, advisory, and administrative relationships to industrial employees in all categories, to his immediate and more general professional associates, to the hygienic authorities, and to management.

3. Industrial hygiene, under which term is included all measures for the determination of the significant and extent of occupational stresses and hazards, and for the development and application of means of controlling such stresses and hazards, so as to promote and maintain industrial health.

4. Pysiology and other basic sciences with particular reference to the manner in which the occupation and environment affect man.

5. Epidemiology and biostatistics and their application to the health problems of the industrial population.

B. *Related Fields.*

1. Special fields of medicine such as mental health, rehabilitation and gerontology.
2. Legal and insurance aspects of industrial medical practice.
3. History, structure, and functions of industry.
4. Social studies (human relations) including such subjects as personnel relations, industrial relations, labor relations and public relations.

C. *Clinical Training.*

Clinical training requires well developed clinical facilities in a medical center in which a well-staffed outpatient dispensary, ample and well-staffed inpatient services, and a variety and a reasonable volume of patients and problems from industry are available for study. Organized and well-staffed clinics in industrial establishments, as well as many other organized medical services in the community may be utilized. Clinical training should provide experience in at least the following areas:

1. Medical appraisal of abilities and disabilities in relation to the requirements of job; job placement and adjustment of worker to job.

2. Management of occupational injury and diseases to include etiology, pathology, diagnosis, prognosis, therapy, rehabilitation and prevention.

3. Medical appraisal of the individual with particular reference to quantitative standards and compensation for disability

Adequate training in rehabilitation can best be provided in an institution in which there is a properly staffed department of rehabilitation. Well developed services in medicine, surgery, and the medical and surgical specialties should be available. The efforts of these services and the department of rehabilitation should be coordinated in achieving the objective of the rehabilitative process, the return of the industrial casualty to a suitable and useful occupation.

D. *Research.*

Investigation of the industrial environment and the response to individuals to it, studies of new materials and new sources of energy and training in the significance of research are an essential part of professional instruction. The resident (or fellow) may be required to prepare a thesis worthy of publication based on his own study.

II. *Type and Content of Training in Industry.*

A. General type and duration of residency in industry.

The resident (or fellow) must serve for a year, preferably in continuous service, in one or more industrial medical organizations approved for scope and quality of service.

B. Professional and Facilities.

1. Personnel.

An industrial medical organization which participates in the training of residents in occupational medicine should be under the direction of a competent physician having position and authority in the organization commensurate with his responsibilities, including that of assuming a high level of ethical conduct and practice within the medical department. All of the activities of the industry relating to the health of employees, industrial hygiene and sanitation, and the hygienic problems of the community as derived from the industry, should be clearly within the authority or area of consultation of the physician in charge.

The staff of the medical department, including nurses and technical assistants, should be adequate in numbers and competent to perform the work which is required of them, and should have such relationship to the chief of the medical staff, and such functions in the performance of the work of the medical department, as are in keeping with sound professional standards.

The local professional relationships of the medical staff shall be such as to insure appropriate liaison with private physicians of the employees. The services of fully qualified consultants in specialized fields of medical and surgical practice should be utilized as necessary.

2. Facilities.

The quarters and facilities of the medical department should be adequate in location, arrangement and equipment to provide freedom from noise, to insure comfort, cleanliness and orderliness in the conduct of the medical work, and especially to yield complete privacy for interviews and medical examinations, and for the maintenance of wholly confidential medical records.

Laboratories, equipment for the conduct of clinical and environmental observations and investigations, and appropriate reference books and periodicals shall be available within the medical or other plant facilities, or in such proximity elsewhere as adequately to meet the needs of the practice of medicine and industrial hygiene.

3. Industrial Medical Practice.

The type of medical practice conducted by the industrial medical department shall be of a high professional quality, and shall extend into all of the fields of medical activity that are appropriate to the needs of the industry concerned.

The medical examinations and the medical records should be such as to reveal the hygienic status of the population of the plant or industry in a reasonably effective manner, with respect to injury, illness, and disease of nonoccupational, as well as of occupational origin. They should also be adequate in respect to the medical problems of the individual employee.

The information on the respective occupations, and on the hygienic problems and hazards associated with specific occupations and operations within the plant or industry, should be comprehensive and up to date, and the means by which such information is kept current, through reports, trips of inspection, analytical and other environmental data, should be part of the regular mechanisms of the medical operations and relationships within the industrial organization.

4. Adaption and Utilization of Personnel and Facilities for Medical Instruction.

In addition to the general adequacy of the medical personnel and facilities for the performance of their necessary duties, the conditions within the medical department and the industrial organization which it serves must be such as to provide time for the training of medical residents. The competence of the preceptors within industry and the affiliation of the personnel of the medical department with the institution responsible for professional instruction must be such as to insure the fulfillment of an educational function, rather than to provide a means of delegating the less exacting and less responsible work of the medical department to a subordinate in training.

Eligibility of Applicants. In addition to the qualifications required for applicants in the other specialties (General Requirements, paragraph 6, Section 1, page 10 of current essentials), the applicants for an appointment to an approved residency in Occupational Medicine should have completed one academic year in an accredited school of public health leading to a degree or Master of Public Health or have had equivalent training. In some cases, residency training may precede the year of formal academic training.

The provisions of the section on General Requirements (pages 6-17 of current essentials) must also be met for approval

Board Requirements. Candidates for examination in Occupational Medicine must meet the general requirements of the American Board of Preventive Medicine, in that they complete a year of internship in an approved hospital and at least six additional years of training and experience in Occupational Medicine. One of these years must have been devoted to graduate study leading to a degree of Master of Public Health in an approved School of Public Health (or other similar training and study satisfactory to the Board.) Another year must have been spent in graduate study in Occupational Medicine or in a closely related field acceptable to the Board. (Sec. I).

At least one of the remaining four years must have been spent in an approved Occupational Medicine program in one or more industrial medical organizations approved for scope and quality of service. (Sec. II).

PUBLIC HEALTH

Residencies in this field should include training in the principal divisions of public health, such as administration, health education, epidemiology (control of infectious and degenerative disease), maternal health, infant and child health, accident prevention and sanitation. Approval for residency training in the specialty is ordinarily extended to training areas organized under a state plan, although recognition may be given to a local health department offering acceptable training in one or more of the major branches. An acceptable program should be for a period of one or more years' duration. If the training is limited to a single field of public health, the length of the training should be at least two years, one of which may be spent in residency training in an appropriate clinical specialty.

The health department in which training is given should be well established and should serve an area large enough to offer comprehensive experience in the several aspects of community health. A program of sufficient scope and diversity is not likely to be provided in communities of less than 50,000 population.*

The department should be efficiently organized on a basis which will assure the provision of public health services of a superior quality as well as proper supervision of the resident's training. It should cooperate actively with other agencies, official and nonofficial, in the development and conduct of a community-wide health program.

The facilities of the health department, including office and laboratory space, should be adequate for the efficient functioning of the public health service. When the work of the resident involves considerable travel, adequate transportation should be provided. The department should maintain a basic collection of reference texts and periodicals in public health and associated fields, whether or not more complete library facilities are available outside the department.

---

*For a method of evaluating the scope and quality of a public health program see "Health Practice Indices," 1950 edition, and the "Evaluation Schedule," November, 1947, published by the American Public Health Association, 1790 Broadway, New York 19.

An efficient system of records must be maintained. Since much of the resident's later responsibility is likely to be administrative in nature, it is essential that he has a thorough indoctrination in the preparation and maintenance of reports, registers, and other required records.

Residency training, at the state and local level, should be under the direction of a qualified physician, trained in public health, who has demonstrated his ability to administer a comprehensive public health program. His professional qualifications should meet the standards required of the staff of hospitals approved for residency training in other specialties (General Requirements, paragraph 1, Section 1, page 7 of current essentials). His staff should include a sufficient number of well trained personnel to provide adequate health service to the community and assistance in the training program. A state department of health responsible for the organization and conduct of a training plan should make available consultative service in the several basic and special public health fields.

The residency training should include planned observation of and active participation in the various public health programs operating within the community. It should include experience in the collection of vital statistics, control of communicable disease, promotion of child and adult health, regulation of the environmental and education of the public with respect to personal and community health. Training in these several fields should be such as to provide familiarity with the planning development and methods of operation of public health programs, and the duties and techniques used by the members of the staffs of the responsible public health agencies.

Eligibility of Applicants. In addition to the qualifications required for applicants in the other specialties (General Requirements, paragraph 6, Section 1, page 10 of current essentials), the applicant for appointment to an approved residency in Public Health should have completed one academic year in an accredited school of public health, leading to a degree of Master of Public Health or have had equivalent advanced training. In some cases, the year of residency may precede the year of formal academic training.

The provisions of the section General Requirements (pages 6-17 of current essentials) must also be met for approval.

Board Requirements. Candidates for examination in Public Health must meet the general requirements of the American Board of Preventive Medicine in that they complete a year of internship in an approved hospital and at least six additional years of training and experience in Public Health.

One of these years shall have been devoted to graduate study leading to a degree of Master of Public Health or its equivalent in an approved college or university (or equivalent training and study satisfactory to the Board) and at least two years of supervised field experience in public health practice in an approved residency. The remaining three years must have been limited to the practice of Public Health, preferably under the supervision of a well qualified specialist in that field.

It is recognized that an individual may obtain suitable training in programs other than those of an official health department; among such are the federal services, industry and certain voluntary agencies. The training of such persons will be adjudged on an individual basis.

2. Radiology

The following revision of the current essentials of an approved residency in Radiology is proposed:

Residencies and fellowships of three years' duration should provide training in all divisions of the specialty—diagnostic roentgenology, therapeutic radiology, including the use of radioactive substances (intracavitary and interstitial), and isotopes. Without attempting to define a detailed plan of instruction, it can be suggested that the first year be devoted principally to pathology, roentgenologic technic and general orientation in the radiologic field. In the second and third years the clinical applications of radiology should be emphasized with at least one year or the equivalent assigned exclusively to radiotherapy. In view of importance of pathology as a basis for radiologic diagnosis and therapy, it is recommended that a minimum of six months be devoted to pathologic anatomy, particularly the study of gross pathology and tumors. Instruction in radiation physics and radiobiology may well run concurrently with the training in radiioactive substances and isotopes, therapy and therapeutic roentgenology.

Residencies in a restricted field of radiology can likewise be modeled on this plan. The training should be systematic and progressive in character with gradual assignment of responsibility in both diagnosis and therapy. It should also include an active participation in radiologic conferences, staff meetings, and joint conferences with other departments. An adequate amount of clinical material must be available in the divisions of radiology in which residency or fellowship training is offered.

The relationship of the radiology department to residencies and fellowships in other fields is stated in Sections 1 and 2 (current essentials).

Quantitative Requirements. The quantitative requirements in this field depend upon the field of radiology in which training is undertaken. In residencies covering the entire field of Radiology, it is desirable that there be a minimum of approximately 3,500 roentgenographic examinations per year (which include a satisfactory spread of examinations in various systems); 1,500 roentgen therapeutic procedures (which include at least superficial and deep therapy); and approximately 25 radium treatments, exclusive of intrauterine applications (the radium treatments should at least include treatments with moulds and implantation with needles and radon). The caliber of the training program in a fairly wide field is of more importance than the number of examinations and therapeutic procedures.

Applied Basic Science Instruction. In the applied basic sciences, emphasis should be placed on instruction in pathologic anatomy, radiation physics and radiobiology. Such work should be closely related with clinical experience. See Section 1-9 (current essentials) for a discussion of applied basic medical science instruction.

The provisions of the section General Requirements (pages 6-17 of current essentials) must also be met for approval.

Board Requirements. The American Board of Radiology certifies physicians in a) the entire field of radiology, b) diagnostic roentgenology, and c) therapeutic radiology. An applicant for the certification examination must have completed a period of study after the internship of at least three years in an institution approved for radiologic training. This period of specialized training should include an active experience in clinical radiology of not less than thirty months and residency instruction in pathologic anatomy, radiation physics and radiobiology.

REPORT OF THE COUNCIL ON MEDICAL SERVICE

To the Members of the House of Delegates of the American Medical Association:

The Council on Medical Service continues to keep abreast of developments in the over-all field of medical care and reports these to the medical profession and the public. As plans and programs relating to the provision of physicians' services have multiplied, the Council's work has, of necessity, undergone a parallel expansion. To cover the field adequately and to be assured of expert advice in all areas of its work, eight committees assist the Council in making studies, developing facts and data, and preparing reports. The 56 physicians and one layman on these committees provide the American Medical Association with a geographical variety of viewpoint as well as expert opinion in the fields represented by each.

It is not possible, even in the annual report, to present in detail all of the activities of the Council, its committees, and staff. However, the following pages do contain a review of some of the work carried on from July 1, 1955, to June 30, 1956. Before going into details, here are some observations that may be of interest to the House:

Increase of Council Membership.—To facilitate the work of the Council, its elected membership was increased at the Annual Meeting in June, 1956, from six to nine members.

Voluntary Health Insurance.—More people were covered by voluntary health insurance by the end of 1955 than ever before—over 107 million hospital, nearly 92 million surgical, and over 55 million medical. Catastrophic coverage has more than doubled during the past year, from 2,235,000 to over 5 million. By midyear 1956 it was estimated that all of the aforementioned figures had increased substantially. The midyear estimates by category were: Hospital, 110 million; surgical, 94 million; medical, 58 million; and 7 million for catastrophic or major hospital and medical expense.

Medical School Study.—The report on private practice arrangements of medical school faculty members was made to and approved by the House in June, 1956. It is obvious, however, that making a report in itself is not the solution to problems. Since breakdown of liaison between physicians in private practice and medical schools was a primary factor in most areas where conflicts occur, it is urged that members of the House take active part locally in developing proper communication. The Committee itself will continue to follow developments in the problem areas and will review its conclusions and recommendations relative to such developments.

Group Medical Practice.—The study of group medical practice shows 735 groups in operation of which 640 have three or more physicians and 95 have only two physicians. However, there is still considerable confusion regarding terminology used in this field, and an effort will be made to develop acceptable definitions to describe this method of practice which has been the subject of much discussion in recent years.

Hill-Burton.—The study of the first 10 years under the Hill-Burton Hospital Construction Act now under way is showing evidence of change in emphasis from rural facilities to replacement of existing old or obsolete hospital facilities and increased emphasis on chronic disease facilities and other special categories such as diagnostic and treatment centers, rehabilitation centers, and nursing homes.

Physicians Placement Service.—Many communities that have long been without a doctor now have the services of their own physician through the efforts of the Council's Placement Service and the placement services of state medical associations which have aided more than 3,713 physicians and communities.

Federal Medical Services.—Publication of the Federal Medical Services Newsletter has been resumed and is being sent to members of the House of Delegates as well as state committees dealing with these problems. The Newsletter now refers to all medical programs coming within the purview of the Federal government.

Mine Workers Program.—This spring some 50 physicians participated in a field trip sponsored by the Council on Medical Service and Council on Industrial Health through the West Virginia coal mining areas prior to the Fourth Conference on Medical Care in the Bituminous Coal Mine Area. Over 500 local physicians attended meetings in Beckley and Bluefield, W. Va., to discuss their problems with this field group.

Chronic Illness Newsletter.—The Chronic Illness Newsletter, which the Council started publishing in February, has been well received by the many and varied groups and individuals included in the mailing list of 12,000.

Committee on Aging.—The Committee on Aging has its program well under way and is conducting a panel on this subject during the Clinical Meeting. It is hoped that state medical associations and most of the larger county medical societies will see fit to create similar committees so that the medical profession will assume its proper leadership in the field of aging.

Lay Sponsored Health Plans.—The Committee on Relations with Lay Sponsored Voluntary Health Plans has continued its active interest in those programs sponsored by nonmedical groups designed either to provide health care or finance its costs.

Maternal Death Studies.—A "Guide" to assist committees in carrying on maternal death studies has been completed and is being submitted at this time to the House of Delegates for consideration and approval.

Finally, the Council wishes to call the attention of the House of Delegates to the loss during the year of Dr. Arthur C. Scott Jr., who served as a member from December, 1954, to the time of his death, Feb. 21, 1956, and of Dr. Thomas A. McGoldrick, who served as a member from 1944 to 1952. Although Dr. Scott had served only a short time on the Council, he had become a key member, serving on the Council's Committee on Medical Care for Industrial Workers and as the Council designee on the Committee on Relations with Lay Sponsored Voluntary Health Plans. He took an active part in developing the principles for union and management sponsored health centers, and served as chairman of the Special Committee on General Practice Prior to Specialization of the House of Delegates. Dr. McGoldrick served as Vice President of the American Medical Association in addition to being a member of the Council during its formative period. He played a leading part in the development of the first "Platform of the American Medical Association," and to him as much as anyone should go the credit for establishing many of the principles under which the Council works at the present time.

Committee on Medical and Related Facilities

The membership of this Committee has had one personnel change during the past year. Dr. Raymond M. McKeown, Coos Bay, Ore., was named to replace Dr. Ralph A. Johnson, Detroit. Dr. Willard A. Wright was appointed chairman of the Committee. Other members are Drs. Robert L. Novy, Detroit; Walter E. Vest, Huntington, W. Va.,; E. Dwight Barnett, New York; David Henry Poer, Atlanta, Ga.; and Cleon A. Nafe, Indianapolis.

The Committee has met on four occasions in Chicago during the year: Sept. 17-18, 1955; Nov. 5-6, 1955; Feb. 12-14, 1956; and April 27-29, 1956.

MEDICAL SCHOOL STUDY

The primary task of this Committee during the past year has been the study of problems relating to the private practice arrangements of medical school faculty members. Since the study was completed this spring, a report was made to the Council and to the House of Delegates at the June session rather than waiting until the usual reporting time. In this report the Committee submitted its conclusions and recommendations, which were approved by the Council and adopted by the House.

It would serve no purpose to review the report at this time. However, the Committee would urge that the members of the House discuss the recommendations with their state associations, particularly those having to do with the development of proper liaison between the physicians in private practice and the medical schools. The breakdown of such liaison, in the opinion of this Committee, has been a primary factor in most of the areas where conflicts have occurred.

GROUP PRACTICE STUDY

The field study concerning the organization and operation of medical group practice units has been completed. A progress report on the first 48 groups was published in the Aug. 4, 1956, issue of THE JOURNAL. An additional 50 groups were visited this summer and the complete report covering over 100 groups in 23 of the 48 states will be published in booklet form. In addition to the field study, the Committee has continued to develop a roster or list of group practice units by states. So much has been said about the trend toward group practice and so little data on the number and characteristics has been available, this project was undertaken to supplement the field study. At this stage, a total of 735 groups has been listed. Of this number, 640 are groups with 3 or more physicians and 95 are 2-doctor group practice units. The listing is not complete and will probably never be complete at any given time because of the lag between the organization of new groups, the dissolution of existing groups, and reports of these to the American Medical Association.

One facet of this area of medical service that is still unclear and leads to confusion is the terminology. The terms—group, group practice, medical group, group clinic, clinic, etc.—seem to be used to suit convenience with little relationship to the characteristics of the physical or organizational units to which they apply. Several state medical associations have concerned themselves with this problem and this Committee believes it to be of sufficient importance to warrant study by the Association. Therefore, a review will be made of existing literature, and medical societies and other interested groups will be contacted for the purpose of developing suggestions relative to terminology and definitions.

HILL-BURTON HOSPITAL CONSTRUCTION ACT

The Board of Trustees has requested the Council to re-evaluate the need for and effectiveness of the Hill-Burton Construction Program. The Board stated that "continued endorsement by the Association should be based on the facts as they exist today and not as they existed ten years ago."

The study is now underway and will be reported on when completed. As a first step, the Council, with the assistance of the Law Department, prepared a questionnaire to be mailed to all state associations. It is hoped from this that the Council will learn what progress has been made in each state since the inception of the Act and also the policies and reactions of the associations concerning the program. The second step includes a review of available data on the program and the progress made in relation to purpose and need. As a third step, conferences have been held with staff members of the Public Health Service, with members of various state agencies, medical societies, and possibly hospital administrators to gather further information. Future activity on this study will depend upon the results of these three steps.

The Council reports each year on Hill-Burton hospital construction. The following table shows the data taken from the Public Health Service report for the fiscal year 1956 (June 30). This table shows an increase over the last report of 533 projects approved and 145 projects completed and in operation.

Hill-Burton Construction Status

Projects	*June 30, 1955*	*June 30, 1956*
In Operation	1,905	2,050
Under Construction	503	806
Initially Approved	106	191
Total	2,514	3,047

The following table shows the categories of hospital beds and shows the breakdown of projects other than hospitals and nursing homes as to type and status of construction from the inception of the program through June 30, 1956. The total cost for the projects has been estimated at $2,467,333,207 of which the federal share will amount to $781,421,267, approximately one-third.

Hill-Burton Construction Status of Hospital Beds and Health Unit Projects Other than Hospitals and Nursing Homes

Project	*Approved*	*In Operation*	*Under Construction*	*Initially Approved*
Beds:				
General Hospital	130,978	95,149	28,636	7,193
Chronic Disease	2,261	–	2,022	239
Nursing Homes	2,259	–	2,189	70
Total	135,498	95,149	32,847	7,502
Health Units (Projects):				
Health Centers	628	433	147	48
Rehabilitation Facilities	43	–	42	1
Diagnostic or Treatment Centers	77	1	66	10
Total	748	434	255	59

PHYSICIANS PLACEMENT SERVICE

During the year from July, 1955, to July, 1956, the Physicians Placement Service has given assistance to 3,713 physicians locating or relocating, communities seeking physicians, medical groups seeking additional specialists, and physicians seeking associates. This is almost identical with the services rendered the previous year. In many cases the Council has been the starting point for the above services; in every case the request has been referred to the state medical associations.

Physicians Requests.—The number of inquiries from physicians for information as to locations continues to decrease from the peak reached two years ago.

Requests from physicians	July, 1955 - July, 1956–	938
" " "	July, 1954 - July, 1955–	1,332
" " "	July, 1953 - July, 1954–	1,382
" " "	July, 1952 - July, 1953–	622

These figures reflect the influence of the gradual increase in state placement activities since 1953 and of the Committee's efforts to limit American Medical Association placement activities in favor of the state programs.

In addition to the 938 requests, the Committee continues to send questionnaires to all physicians being released from military service who indicate to the Council on National Defense that placement assistance is desired.

Approximately 1,900 data sheets on physicians seeking a location were forwarded to state medical associations. Statistically this would mean that each doctor inquired about locations in two states; actually many ask about several states and many ask only about one state. The most popular states are California, Illinois, New York, Oregon, and Washington.

Community Requests.—The fact that a copy of state lists of communities seeking a physician are now supplied to the Physicians Placement Service by 42 state placement services as compared with 39 lists last year and 19 in 1952, is further evidence of increasing state activity. Some are still bare lists of towns and not much more; however, the number offering such limited information is decreasing. Perhaps there is a greater realization that it takes more than the name of a town to create enough interest for a physician to contact the state medical association for further information.

The number of openings now listed for general practitioners is 1,565. This figure has not varied appreciably during the past several years, but the breakdown by population of the towns listed has changed noticeably. According to the composite map maintained in the Council office on which these locations are spotted, there is an increase in the number of requests from communities with a population (1) up to 1,000, and (2) over 5,000, and a decrease in the number of requests in the range of 1,000 to 5,000 population. Listings from cities of 5,000 or more are almost without exception from physicians seeking an associate. Communities listed between 1,000 and 5,000 population have an increasing number of listings in this same category, that is, physicians seeking an associate. In other words, the greatest number of individual general practice openings now listed are for communities of less than 1,000 people. This does not mean that there is not an opportunity for general practitioners, but it does mean that in cities of over 5,000, the general practitioner who wishes to practice alone must do some research on his own. There seems to be little organized effort to find additional physicians for the larger cities that have medical personnel; most of the effort here and in the states is directed toward communities not having a doctor.

This year has seen an increase in the turnover in the openings for specialists. As of July, 1956, the files contained 403 opportunities in the specialty fields as compared with 247 a year ago. A breakdown of this figure shows a ratio among the various specialties much the same as last year. Again the greatest discrepancy between requests from physicians and openings occurs in pediatrics, psychiatry, and otorhinolaryngology and ophthalmology with the number of inquiring physicians being far less than the number of openings. At the same time, the number of inquiring surgeons continues to be greater than the number of requests for specialists in this field, unless the surgeon will also do general practice.

Listings of salaried positions include college health, foreign, industrial, institutions, Public Health, locum tenens, U. S. Government, and Veterans Administration. As of July 1, 1956, the total number of such openings was 256. In this category the number of requests received from physicians seeking a foreign location is greater than the number of foreign openings. Contacts with U. S. companies having operations abroad indicate that local situations make it advisable to use native physicians in most cases.

Specialists' Assistance.—In order to be of assistance to the increasing number of specialists who have requested information regarding opportunities for practice, a copy of the booklet, "Physicians Placement Services—1955", was sent with a letter to the members of the National Association of Clinic Managers. The booklet presented a brief explanation of the services available and the letter offered the services to group practices seeking additional physicians. As a direct result, 68 opportunities in 11 different specialty fields were listed. The number of opportunities from this group has continued to increase.

A letter of inquiry with a copy of the placement service booklet was also sent to 82 specialty groups. The purpose of the letter was to determine which organizations do not maintain a placement service and request their assistance in calling to the attention of their members the services offered by the state medical associations and by the American Medical Association.

The replies showed that most national specialty groups do not maintain placement services. However, a number of these groups do, including the following:

American Academy of Occupational Medicine
American Academy of Pediatrics
American Academy of Neurology
American College of Chest Physicians
American College of Obstetrics and Gynecology
American College of Radiologists
American Society of Anesthesiologists, Inc.
American Society for Experimental Pathology
College of American Pathologists
Industrial Medical Association
American Urological Association

Most of the other specialty organizations indicated that the placement activities of the state medical associations and of the American Medical Association would be called to the attention of the membership through their meetings, newsletters, and other publications. In the past few months many letters from physicians seeking an associate as well as those seeking a location for practice have mentioned that the Physicians Placement Service was called to their attention through a publication serving their specialty group.

Booklets, Articles, Exhibits.—The format for the Sears-Roebuck Plan of Assistance booklet was changed during the past year and was sent by the Council to the state medical associations, the larger county medical societies, the teaching hospitals, and medical schools. Another booklet entitled "Planning Guide for Establishing Medical Practice Units" has also been mailed on request to several thousand physicians, either on a loan basis, or to be turned over to the local medical society.

The Placement Service exhibit at the Student A.M.A. meeting in Chicago was well attended both by students and interns. Although these people will not in most cases be available for practice for several years it is not too early for them to consider some of the factors in seeking a location for practice. As several pointed out, their current vacations can be spent in seeing first-hand the areas where they have thought of locating.

Community Rating Schedule.—In September, 1953, the Community Rating Schedule was presented to the state medical groups. This schedule was designed to offer communities a means of self-inventory as to how much they really needed more medical care, what attractions they had to offer, and the extent to which they could support a physician.

A survey on the distribution of physicians has been completed by the Texas Medical Association. This survey has made use of a form of the Schedule which was adapted to the particular needs of the state. A copy of the study covering one district has been sent to each state medical association. A final report was presented to the Texas Committee on Doctor Distribution at the time of its annual session this year. Plans are under way to collect all pertinent data in a Doctor Distribution Survey Handbook.—The Nevada State Medical Association has been working with a number of other interested groups in the state conducting a Health and Medical Services Survey. Detailed questionnaires have been prepared for use by committees in both counties and communities. The purpose of this survey is to determine areas needing assistance in securing better health and medical services and how the need may best be met.

Other states indicating use of the Schedule are Indiana, Iowa, North Carolina, Oklahoma, and Virginia.

Committee on Indigent Care

The members of this Committee are. Drs. H. B. Mulholland, Chairman, Charlottesville, Va., A. J. Bowles, Seattle, E. P. Coleman, Canton, Ill., J. L. Lattimore, Topeka, Kans., I. Jay Brightman, Albany, N. Y., E. A. Ockuly, Toledo, Ohio, Dean W. Roberts, Chicago; and R. M. Hilliard, Chicago, consultant.

CHRONIC ILLNESS NEWSLETTER

In Jan. 1956, publication of the Newsletter of the Commission on Chronic Illness was turned over to the Council on Medical Service. Although chronic illness does not in itself fit into the functions of this Committee, the contacts and files developed through indigent care activities lent themselves to the editing of such a publication. To assist in this task a special editorial committee was selected, composed of Dr. Mulholland, Dr. Dean Roberts, former Director of the Commission, Dr. Edward L. Bortz, member of the Council's Committee on Aging, and Mrs. Lucille Smith, former member of the Commission.

The Committee is pleased to report that many expressions of appreciation and congratulations have been received on the issues published to date. This has been especially pleasant, since most of the persons on the mailing list are not physicians and represent allied groups in the nursing, public health, hospital, and institutional fields. In addition, through the Newsletter we are reaching the governors of the states, the public welfare directors, and the directors of many national and state voluntary health organizations. On the other hand, since the announcement of this was published in THE JOURNAL many physicians have written for copies and asked to be placed on the mailing list.

At present, the Newsletter is published bi-monthly and sent to over 12,000 persons and organizations. If additions and deletions continue at the present rate the total net addition to this list will range somewhere between 300 and 500, all on personal request. As to frequency of publication, it seems that the subject is of sufficient interest and variety to warrant eight issues yearly, omitting the months of June, July, August, and December. Aside from the Newsletter, the announcement that the American Medical Association had assumed this responsibility has brought many requests for material and advice relating to various aspects of chronic illness. As a result the staff has started to develop information and sources of information to assist in replying to such requests. Chronic illness, like aging, is a subject many people "talk" about but seldom "do" much about. The Committee hopes to be of some help in remedying this situation

SURVEYS

One of the projects underway is a survey of what are generally termed "home care programs". Questionaires have been sent to all organizations that have been noted in literature on this subject as having such programs. These organizations were queried in detail as to the origin and purposes of the program, the types of patients served, administrative mechanics of the program, sources of financing, number and type of services offered to the patient at home and the advantages and problems encountered in the operation of the program. Replies to date (from a total of 68 questionaires mailed, 46 have presently been returned) indicate that these programs are meeting a definite need in caring for those indigent and/or chronically ill patients whose medical, nursing, social, and rehabilitative needs can be met in their own homes. Some of the advantages of a home care program cited by the organizations replying include a more coordinated spectrum of medical and related services to the patient, the psychological advantage to the patient of being in his own home, reduced cost to the patient or assistance agency, a more efficient use of hospital beds, and an improved teaching experience for medical students participating in the program. Many of the programs are administered by a hospital, some by visiting nurse associations, welfare councils, and other agencies. All are regarded by the sponsoring organizations not as a substitute for hospital care but as an extension of hospital care into the homes of selected patients, with additional nursing, social and rehabilitative services as needed. A complete report on these programs will be submitted for JOURNAL publication as soon as all questionaires have been returned.

A second project is a survey of Central Services for the Chronically Ill. This is a central referral service, having information on all local service and facilities programs that might be of assistance to chronically ill patients and to which physicians, nurses, health and welfare agencies, industry, etc. may turn when they have patients needing such services or facilities Information as to the organization and operation of these "central services" will be compiled in report form and made available on request. Letters have been sent to six such service centers that have been noted in literature on the subject. in Chicago, Milwaukee, Cleveland, San Francisco, Newark (N. J.), and Philadelphia. The material sent in reply is being organized into a loan kit on the subject.

A third project which will have to be undertaken in the near future is a review of the operation of the amendment to the Social Security Act which provides for federal funds to be used on a matching basis for medical care for the categorical groups within the welfare program. This amendment will undoubtedly stimulate the creation of so-called pooled funds and the ear-marking of state funds for medical care so as to obtain federal money. Every state medical association should be aware of this amendment and any medical programs that may be developed as a result.

Committee on Maternal and Child Care

The members of this Committee are Drs. W. L. Crawford, chairman, Rockford, Ill.; R. B. Chrisman Jr., Coral Gables, Fla.; Philip S. Barba, Philadelphia; Harold S. Morgan, Lincoln, Neb.; J. L. Reichert, Chicago; Garland D. Murphy, El Dorado, Ark.; and Howard A. Nelson, Greenwood, Miss.

REGIONAL MEETINGS

Since the last annual report, the Committee has had three meetings, and as part of each meeting it has sponsored joint conferences with other groups. The purpose of these conferences with representatives of the medical societies and health departments is to acquaint the Committee with the various problems encountered relative to maternal and child health and to provide guidance and assistance to the states in initiating or improving programs in this general field of medical service.

The first of these was held at Virginia Beach, Va., on Oct. 22-23, 1955, one day of which was devoted to a meeting with representatives of state medical society committees concerned with maternal and child health. Following this meeting, a staff member made a field survey of the various maternal and child health programs functioning in the state of North Carolina. This survey included a review of the state medical society's Maternal Welfare Committee activities and programs aimed at reducing perinatal mortality.

The second regional meeting was held in Hot Springs, Ark., March 10-11, 1956. Sixteen medical society and health department representatives from six surrounding states attended this meeting. Prior to this meeting a staff member visited five of these states and prepared a summary of the various medical society and health department activities relative to maternal and child care and services in order to provide a preliminary appraisal by the Committee members of some of the special problems encountered in this section of the country. The third meeting, held in Chicago in June, 1956, was devoted to the subject of maternal death studies and is considered later in this report.

These meetings, and similar proposed meetings in other regions of the country, have served their purpose: to acquaint the various states with what the American Medical Association is doing in its efforts to be of assistance to state and local medical societies as well as to provide first-hand information to the Committee members. Actually the meetings are another step by the Committee in its program of assistance to medical societies, practicing physicians, and voluntary and government health agencies in their efforts to improve maternal and child health

MATERNAL MORTALITY STUDIES

The importance and urgency of the committee's effort to develop guides and techniques for the organization and operation of programs to improve maternal and child health became apparent in these regional meetings. All physicians attending these conferences were anxious to initiate and improve state and local programs but, in most instances, sought leadership and guidance. Therefore, preparations began immediately for a conference of national and regional groups interested in maternal mortality studies. The Committee had sponsored a preliminary meeting a year ago, March 10-11, 1955, in Chicago on this specific problem and had proposed such a joint conference to develop some type of guides for state committees. All appropriate groups were contacted and invited to send representatives to a conference in Chicago on June 15, 1956. Response was excellent and the following organizations sent representatives: American Committee on Maternal Welfare, American College of Obstetricians and Gynecologists, American Association of Obstetricians and Gynecologists, American Gynecological Society, Central Association of Obstetricians and Gynecologists, Association of State and Territorial Health Officers, Association of State Maternal and Child Health and Crippled Children Directors, and the Section on Obstetrics and Gynecology of the American Medical Association. In all, 14 physicians and two executive secretaries were present in addition to the committee and staff members. The American Academy of General Practice had appointed a physician to represent it but this individual was prevented from attending due to other meetings on the same day. Dr. Philip F. Williams from Philadelphia attended as special consultant to the Committee.

The purpose of this Conference was (1) to review and discuss principles and policies involving maternal mortality study committees, problems in their operation, and the results of surveys and studies on the subject, and (2) to agree on terminology, organizational methods, and operational procedures for such committees. The materials used were (1) recommended "Definitions" and "Classification of Deaths Related to Pregnancy" as developed by the Special Committee for the Study of Maternal Deaths of the Central Association of Obstetricians and Gynecologists: Drs. Harold A. Ott and Harold W. Longyear, co-chairmen; (2) the "Suggested Outline for Organization and Operating a Maternal Mortality Committee" as developed by the Coordinating Subcommittee for State and Local Mortality and Morbidity Committees of the American Committee on Maternal Welfare: Dr. Luella E. Nadelhoffer, chairman; and (3) an outline summary of nine maternal mortality study programs divided into five categories (terminology, organization, operation, legal status and complications encountered, and results) for comparison and study as developed by the Committee on Maternal and Child Care: Dr. W. L. Crawford, chairman.

It was the consensus of the assembled group at this June 15 meeting that the results should not be allowed to "get cold", but should be "firmed up" as soon as possible. Therefore, the Committee compiled the agreed upon definitions and classifications plus organizational methods and operation techniques into a "Guide for Maternal Death Studies" for further review by the Conference group. A follow-up meeting, consisting of one representative from each group, was held. The completed "Guide" is herewith submitted to the House of Delegates for its consideration and, if approved, the Committee plans to distribute this material to all state and county medical societies and state health departments.

GUIDE FOR MATERNAL DEATH STUDIES

This guide has been prepared with the full recognition that it may be altered to suit varying state and local situations. In general it represents the combined efforts of representatives from The American College of Obstetricians and Gynecologists, The American Association of Obstetricians and Gynecologists, the American Gynecological Society, The Central Association of Obstetricians and Gynecologists, The American Committee on Maternal Welfare, The Association of State and Territorial Health Officers, The Association of State Maternal and Child Health and Crippled Children Directors, The American Academy of General Practice, and the Section on Obstetrics and Gynecology and Committee on Maternal and Child Care of the American Medical Association. However, THIS GUIDE DOES NOT NECESSARILY CONSTITUTE A POLICY STATEMENT OF ANY OF THE ABOVE ORGANIZATIONS WHICH HAVE COOPERATED WITH THIS COMMITTEE.

The expressed purpose of this guide is to assist medical organizations interested in improving existing studies or in developing such studies by promoting uniformity in terminology, classification, organization, and operation. If it is to serve this purpose, it should be considered as a Set of suggestions and not rules and may be modified to suit the need. It is anticipated that this guide will be followed by a similar guide for perinatal mortality committees.

The Committee on Maternal and Child Care is indebted to the representatives of the above listed organizations for their assistance in this project and wishes to express special appreciation to Dr. Luella E. Nadelhoffer, Evanston, Illinois and Drs. Harold A. Ott and Harold W. Longyear, Royal Oak, Michigan for their contribution of much of the original material used as a basis for the preparation of this guide; and to Dr. Philip F. Williams of Philadelphia who has acted as consultant to the Committee on this and other occasions.

It is recognized that many variables, including the laws of the several states, may influence the operations or procedures followed by a committee organized within the framework of this guide. Committees should have no reluctance in seeking the advice of legal counsel whenever question arises concerning the applicability of state laws to this guide. They should feel free to call on the Council on Medical Service and the Law Department of the Association for advice when needed.

Terminology and Definitions in Maternal Death Studies

The collection and tabulation of information and data in an orderly manner is necessary in any study. Then to compare and analyze the results of the various studies require that such information and data be concerned with like things or characteristics. As a result the first step in preparing a "guide" is the development of terminology and definitions. The following are in no sense absolute, but they do represent an agreed upon compromise in the thinking of those who participated in this project. It is suggested that committees conducting such studies utilize these terms and definitions for a trial period of three years and report their experiences to the Council on Medical Service.

I. Maternal Death: The death of any woman dying of any cause whatsoever while pregnant or within 90 days of the termination of the pregnancy, irrespective of the duration of the pregnancy at the time of the termination or the method by which it was terminated.

(NOTE: The term "maternal death," as here defined to be used by maternal mortality study committees indicating the scope of their studies, should not be confused with the official state and national "maternal mortality" statistics which include only those deaths with International Classification Causes numbering 640-689.)

A. Direct Obstetric Cause of Death: A death resulting from complications of the pregnancy itself, from intervention elected or required by the pregnancy, or resulting from the chain of events initiated by the complication or the intervention. These deaths include those causes listed in Chapter XI of the International Statistical Classification of Diseases, Injuries, and Causes of Death, Sixth Revision, Code Nos. 640-689, and other causes consistent with this definition. (See section on "Classification of Maternal Deaths")

B. Indirect Obstetric Cause of Death: A death resulting from disease before or developing during pregnancy (not a direct effect of the pregnancy) which was obviously aggravated by the physiological effects of the pregnancy and caused the death. (See section on "Classification of Maternal Deaths")

C. Non-Related Cause of Death: A death occurring during pregnancy or within 90 days of its termination from causes not related to the pregnancy, nor to its complications or management. (See section on "Classification of Maternal Deaths")

II. Obstetric (Commonly referred to as Maternal) Death Rate: The number of maternal deaths due to direct obstetric causes (including only those referred to in I.-A) per ten thousand live births over the usual period of 12 months. (If in doubt about classification of a particular diagnosis, consult the National Office of Vital Statistics).

III. Factors of Preventability (Avoidability): Preventability should be judged in an ideal academic sense. This concept involves three assumptions. First, the physician possessed all the knowledge currently available relating to the factors involved in the death. Second, by experience, he had reached a high level of technical ability. Third, he had available to him all the facilities present in a well organized and properly equipped hospital. Because of the austerity of these criteria it is more desirable to *determine avoidable factors* involved in the death, rather than to label the death as preventable. This allows more specific discussion resulting in better maternal care and reduction of obstetric causes of death.

IV. Factors of Responsibility: Responsibility should be determined whenever possible and assigned as appropriate to the attending physician, consultant, midwife, hospital, patient, or any combination. (See Appendix for cases exemplifying the various factors as defined in the following five categories).

A. Professional Factors: These are concerned with cases where there appear to be shortcomings in diagnosis, judgment, management, and technique, and include failure to recognize the complication or evaluate it properly. They also include instances of injudicious haste, delay or timing of operative intervention, and failure to utilize currently acceptable methods of treatment. Finally, they would include services which were technically inept, and those failures which could have been averted by proper and timely consultation.

B. Hospital Factors: These are concerned with facilities, equipment or personnel which are inadequate. In terms of modern obstetrics the hazards of delivery cannot be met successfully unless the hospital provides, among other things, (1) a separate, well directed maternity section, (2) a blood bank, (3) competent 24 hour anesthesia service, (4) suitable x-ray facilities and (5) adequate 24 hour laboratory facilities

C. Patient Factors: These should be recognized, but never as an excuse for professional inadequacy. They are concerned with death resulting from a complication for which there is generally successful treatment but which the patient denied herself by delaying her initial visit to the physician, by delaying obtaining medical care after the symptoms were obvious at a layman's level, or finally, by not following the advice and instructions of her physician.

D. Undetermined Factors: If because of inadequate evidence a clear-cut decision cannot be made, yet shortcomings in care are apparent, it would be preferable to indicate that responsible factors are undetermined. An attempt should be made to determine preventability and to locate the responsible factors

E. Any Combination of Factors in the Above Categories

Classification of Maternal Deaths

I. Direct Obstetric Causes. Included are those listed in Chapter XI, "Deliveries and Complications of Pregnancy, Childbirth, and the Puerperium", Code Numbers 640-689, of the International Statistical Classification of Diseases, Injuries, and Causes of Death, Sixth Revision, plus other causes not listed in Chapter XI but belonging in this Classification. The following main headings are recommended: (See Appendix for list of three-digit Categories, and see the Manual, Sixth Revision, for four-digit subcategories.)

A. Hemorrhage
B. Toxemia
C. Infection
D. Vascular Accidents (such as Air Embolism, Amniotic Fluid Embolism)
E. Anesthesia
F. Other (such as Molar Pregnancy and Transfusion Hemolysis)
G. Undetermined (A necessary category which should be reduced as much as possible, especially through the use of adequate records and autopsies)

II. Indirect Obstetric Causes

A. Cardiac Disease
B. Vascular Disease (such as Hypertensive Vascular Disease and Vascular Embolism)
C. Reproductive Tract Disease (such as Uterine and Adnexal Tumors)
D. Urinary Tract Disease
E. Hepatic Disease
F. Pulmonary Disease
G. Metabolic Disease (such as Diabetes)
H. Other (such as Appendicitis and Peritonitis of non-puerperal origin)
I. Undetermined (A necessary category which should be reduced as much as possible, especially through the use of adequate records and autopsies)

III. Non-Related Causes

A. Communicable and Infectious Disease
B. Blood Dyscrasias
C. Malignancy
D. Suicide
E. Murder
F. Accidental
G. Other
H. Undetermined (A necessary category which should be reduced as much as possible, especially through the use of adequate records and autopsies)

Organization and Operation of a Committee to Study Maternal Mortality

I. Purpose and Function:

A. The purpose of a Maternal Mortality Study Committee is to determine, by scientific and confidential analysis, all factors involved in maternal deaths in order that (1) avoidable factors in maternal deaths may be reduced or eliminated, and (2) better maternal care may be assured through improvement in teaching and practice.

B. The functions of the Committee include, among others (1) full scientific analysis and frank discussion of the causes of all maternal deaths in its jurisdiction with rigid adherence to ethical and legal principles insuring *anonymity* of all parties involved; (2) determination of existence and nature of avoidable factors, if any; (3) objective and impersonal report and dissemination of knowledge gained; and (4) education of all medical and non-medical personnel connected with obstetrics as well as the lay public in order to accomplish the purposes of the Committee.

II. Organization:

A. Location: any community, county, state or territory.

B. Sponsoring Groups: (1) Medical Society; (2) Any interested group of physicians having approval of local medical society; (3) Medical specialty groups; (4) Health department; or (5) Any combination of above.

C. Membership:

(ROTATING WITH SPECIFIED TENURE–TERMS LONG ENOUGH TO ASSURE CONTINUITY IN INTEREST AND ACTIVITY)

1. Members of the medical profession who might include representatives from the following groups: (a) Local or state medical society; (b) Obstetrics and gynecology; (c) Pediatrics; (d) Public Health; (e) Medical school—department of obstetrics and gynecology; (f) General practice; (g) Anesthesiology; (h) Pathology.

2. Consultants to the Committee, such as: (a) Representative from medical examiner's or coroner's office; (b) Hospital personnel, including administrator, nurses, medical record librarians, and nutritionists; (c) Others, including specialty groups (e. g. cardiologist).

D. Chairman: Appointed by the sponsoring group or elected by membership. An obstetrician is desirable as the chairman.

E. Secretary: Appointed by sponsoring agency or elected by membership of the Committee. Consideration should be given to TENURE OF OFFICE.

F. Meetings: At least quarterly or more frequently as required.

G. Financing: Costs arising from expenses of staff personnel and supplies, and travel costs of members of the committee may be met from the resources of the medical society or the health department or shared by both or from other sources deemed acceptable by the medical society.

III. Operation:

A. Case Finding:

1. Desirable to have specific health department regulation whereby all physicians and hospitals report maternal deaths to the State Maternal and Child Health (or similar) section within a specified period of time after death occurs (e. g. 3 days).

2. Death Certificates screened by Statistics and Records Section of health department and copies of deaths associated with pregnancy sent to Maternal and Child Health (or similar) Section and/or committee secretary.

3. Cross matching, by the Statistics and Records Section, of all female deaths of child bearing age with all birth and fetal death certificates within the preceeding 90 days.

4. Other.

B. Collection of Data

1. Development of questionnaire and other forms and form letters to be used in the study. (See Appendix for examples of forms used in several studies now in progress.)

2. Combined "questionnaire-personal visit" method by a physician or physicians chosen by the committee, or the health department's obstetric consultant if approved by committee.

a. Interviews attending physician and consultant (or physician signing death certificate and midwife or other as the case may be.)

b. Visits hospital and obtains pertinent information from records (or health department clinic if patient attended same and patient delivered at home).

c. Other sources as deemed necessary by the visiting obstetrician (such as the family at the discretion of the attending physician).

3. An alternate method (if visiting obstetrician impractical in certain areas) would be the use of the questionnaire only.

a. Sent directly to attending physician by committee secretary; or

b. Delivered personally to attending physician by committee's hospital representative, who would be responsible for seeing that it was adequately filled out; or

c. Filled out by hospital representative or committee member in the area as the circumstances warrant relative to availability of informants and records.

C. Processing of Data

1. Data summarized by visiting obstetrician (or secretary and/or chairman when questionnaire method only is used) on a standard protocol sheet as approved by the committee.

2. Anonymity preserved by no identifying data relative to the physician, the hospital, or the patient appearing on summary sheet. All original data also made anonymous by code number assignment (by visiting obstetrician or secretary.

3. The Secretary receives all the data collected on a case plus the summary, and, with the chairman, reviews each case protocol.

4. Copies of each case protocol are sent to each member of the committee prior to a meeting.

5. Completed questionnaire and all other data on a case are the confidential property of the committee and proper arrangements should be made for their safekeeping.

D. Committee Meetings

1. Notification to (each committee will have its own ideas as to who should attend meetings but the following are suggestions as to possible invitees): (a) Members. (b) Attending physicians whose cases will be discussed. (c) Hospital obstetrical staff where death occurred. (d) MCH director or other suitable representative of the health department. (e) Medical examiner's or coroner's office representative. (f) Other hospital obstetrical staffs. (g) Other interested physicians as approved by the committee and sponsoring agency.

2. Procedure: (a) Chairman, or a member designated by him, presents the case. (b) A discussant, prepared in advance with complete knowledge on the various aspects of the particular complication in question, is assigned to open discussion on the case. (c) The attending physician and others are encouraged to participate. (d) If a medical examiner's (coroner's) case, a representative from that office should be in attendance to present the findings. (e) Each case is classified by the committee according to the outline "Classification of Maternal Deaths." (f) each case is further classified as to its preventability (avoidability) factors or non-preventable nature according to the "Terminology and Definitions in Maternal Death Studies". (g) The responsibility factors are determined by the committee according to the five categories under "Factors of Responsibility" of the "Terminology and Definitions in Maternal Death Studies".

E. Follow-up and Utilization of Committee Findings

1. The findings should not be in the form of criticism, but rather an analysis pointing out possible avoidable factors.

2. A copy of the committee's findings and comments concerning preventable or avoidable factors may, at the discretion of the committee and with the approval from the sponsoring medical society, be presented to: (a) The attending physician and consultant. (b). Head of obstetrical staff in hospital where death occurred. (c) Hospital administrator. (d) Department of Health in the community. The presentation of these findings

may be made orally, personally delivered, or delivered by registered mail to "Addressee Only" (See Appendix for examples of techniques used.)

3. The committee's findings relative to the cause of a maternal death should be submitted to the statistics and records section of the state for correction, if necessary, of official maternal death statistics.
4. Annual report to sponsoring medical society.
5. Additional reports and articles on the study—and various phases of the study—to be published in the local and/or state medical journal for the benefit of all physicians in the community and/or state (as approved by the sponsoring medical society).
6. Committee material to be available for both under graduate and post graduate teaching.
   a. In medical schools of the state.
   b. By physician lecture teams bringing the unidentified but intimate details of the committee findings to the hospitals of the state and to county medical societies. (See Appendix for examples of techniques used.)
7. Findings to be used by proper agency or organization to promote the improvement of services and facilities in hospitals found to be deficient.
   a. Constant attention should be given to adequacy of records.
   b. Constant attention should be given to correctness of diagnosis; therefore, importance of autopsies should be emphasized.
8. The Committee should accept responsibility for the promotion of lay education in order to reduce avoidable factors concerned with patient responsibility.

F. Future Expansion or Activity

1. Maternal morbidity studies.
2. Cooperate in perinatal mortality studies.

APPENDIX

An appendix to this guide is considered essential for those committees desiring more detail on various specific phases of maternal death studies. The following items have been proposed as contents for that appendix:

1. Detailed descriptive data of selected maternal mortality studies.
2. Examples of "Factors of Responsibility".
3. List of Three-Digit categories from Chapter XI, Deliveries and Complications of Pregnancy, Childbirth, and the Puerperium, Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death, Sixth Revision.
4. Forms used in maternal death studies.
5. Examples of techniques used to communicate findings of committee on individual cases to those most directly concerned.
6. Examples of techniques regarding use of committee findings for professional educational purposes.
7. Examples of laws presently in operation designed to protect participants in scientific studies such as these. Reference will be made to a study being conducted by the Law Department with anticipated results of possible value to state medical associations desiring assistance in proposing such statutes for their states.

COMMITTEE LIAISON ACTIVITIES

In addition to the liaison which the Committee has had with the above-named national and state groups, some of its members have directly and indirectly represented the Council and the American Medical Association in other meetings during the past year. Dr. Barba was in on the planning phase of a Children's Bureau's project, in cooperation with the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists, concerning a three-year statistical study of maternity and newborn services. He also represented the Committee at a Children's Bureau Conference on homemaker services. Dr. Reichert represented the American Academy of Pediatrics and Dr. Crawford and Dr. W. W. Bauer represented the Association on an advisory committee to the National Congress of Parents and Teachers. This committee met on Jan. 21, 1956, to recommend ways and means appropriate for the Congress in their efforts to promote periodic health appraisals for well infants and children.

PUBLICATIONS

A number of articles have appeared in THE JOURNAL this past year. Section B of Part III of the series, "Studies of Maternal and Child Care in the United States", involving the communities of Lincoln and Omaha, Nebr., was in the Oct. 22, 1955, issue. This was later reprinted in combination with Section A, Part IV, Section A, of this same series, involving the state of Michigan, appeared in the March 24, 1956, JOURNAL.

The first (Part I) of a new series of articles on "A Study of Maternal Mortality Committees" was published on Dec. 31, 1955, and was concerned with the Minnesota experience. The second article (Part II) of this series, involving Franklin County, Ohio, appeared in the Jan. 28, 1956, issue. The third article (Part III) appeared May 5, 1956, and described the experiences of the pioneer Philadelphia committee and its maternal mortality studies. This medical society committee, whose first chairman was Dr. Philip F. Williams, is now in its twenty-fifth year of continuous operation. Part IV, concerned with the downstate Illinois study of maternal mortality and ways of improving maternity care was published in August. The Michigan and Wayne County (Detroit) experience and the North Carolina study are scheduled to appear in subsequent issues of THE JOURNAL. These articles will be reproduced in whole or in part in the appendix of the brochure mentioned earlier in this report concerned with the "Guide for Maternal Death Studies." Reprints of the articles in the first series, with subsequent articles to be published, have been reprinted three times to meet the demand for copies.

FUTURE ACTIVITIES

Having completed the "Guide for Maternal Death Studies", the Committee's next task is to prepare guides for the organization and operation of maternal and child care committees for use by state and local medical socities. Concurrent with this project, a special subcommittee will review problems concerned with perinatal death studies to learn what may be done in this area.

Committee on Medical Care for Industrial Workers

The members of this Committee, which is a joint committee of the Council on Medical Service and Council on Industrial Health, are Drs. W. A. Sawyer, Chairman, Rochester, N. Y.; M. N. Newquist, New York; Warren F. Draper, Washington, D. C.; Edwin P. Jordan, Charlottesville, Va.; Frank J. Holroyd, Princeton, W. Va.; Clark Bailey, Harlan, Ky.; and Frederick W. Slobe, Chicago. At present the Council on Medical Service has no designee on this Committee because of the death of Dr. Arthur C. Scott Jr., who served in that capacity.

Three meetings were held by the Committee during the past year. They were primarily concerned with two major activities—the United Mine Workers Welfare and Retirement Fund, and Work Absence Due to Non-Occupational Disability.

UNITED MINE WORKERS WELFARE AND RETIREMENT FUND

A unique feature of the fourth Conference on Medical Care in the Bituminous Coal Mine Area, which was held in Charleston, W. Va., on May 6, 1956, was an extensive two-day field trip to the Beckley and Bluefield coal mine areas by a group of fifty doctors. Physicians from various state medical societies and the United Mine Workers Welfare and Retirement Fund, and the Committee members had an opportunity of securing on-the-scene information about working and housing conditions and medical care provided to miners and their families from hospital administrators and other medical personnel. Two meetings with local medical societies provided for a further exchange of information. All this background aided materially in the success of the conference, attended by over 100 physicians, at which a full and frank discussion of progress and pending problems was presented. One of the highlights of the Conference was the description of the events leading up to the agreement entered into between the United Mine Workers of America and the Medical Society of the State of Pennsylvania which may serve to establish a pattern for other states to follow. The importance of the agreement lies in the fact that it does present a method of resolving a problem in medical relationships which had threatened to undo much of the effort that had gone into bringing about better understanding between the Fund and the medical profession.

While the problem in one state was being successfully negotiated, two others—in the states of Colorado and Illinois—were called to the attention of the Committee. In both instances, the Commitee was called upon by he respective medical societies to assist in resolving local situations. The Executive Medical Officer of the Fund expressed satisfaction at the request of the state societies and offered full cooperation in making data available that might be useful to the Committee in its investigation. Negotiations carried on by the Committee between the Executive Medical Officer of the Fund and the officers of the Illinois State Medical Society resulted in a commitment by the fund and medical society representatives to attempt to resolve the conflict in Illinois in a manner similar to that which was followed in the state of Pennsylvania. There appears to be sufficient reason to believe that the problems can be resolved to the satisfaction of all parties concerned.

A more complex situation presented itself, however, with regard to the Colorado State Medical Society where several situations, some concerning the Area Medical Administrator of the Fund, and some involving a local medical society, arose simultaneously. The Committee accepted the invitation of the state society to conduct a personal study of the situation through field trips to Denver and Trinidad. (This was in accord with the resolution adopted by the House of Delegates in June, 1955. "That all other controversial matters arising between the U. M. W. A. Welfare and Retirement Fund and the participating physicians which cannot be reconciled at the local or state level shall be promptly referred to the Committee on Medical Care for Industrial Workers of the Council on Medical Service and the Council on Industrial Health of the American Medical Association.") The study, which took several days, culminated in a report containing recommendations to the state society as requested by it. The Executive Medical Officer of the Fund has likewise been advised of the report pertaining to its activities in Colorado. In both situations, involving Illinois and Colorado, the Committee stands prepared to render whatever additional assistance is requested of it.

Further conferences will depend upon the outcome of a canvass made of the medical societies in those states in which the Fund operates. The important lesson learned thus far is that the presence of actively functioning liaison committees composed of representatives of the miners' program and organized medicine can, in the main, deal with most problems as they arise. Where such liaison committees are not in existence or not active, it may be helpful for the Committee to provide the means of mediation and advantage of its counsel. Another essential ingredient for the local resolution of problems is an actively functioning staff organization in each hospital so that there is both awareness and supervision of the quality of care rendered.

WORK ABSENCE DUE TO NON-OCCUPATIONAL DISABILITY

The Committee realized one of its major goals on Jan. 23, 1956, when it held a one-day conference devoted to this problem area as a part of the Congress on Industrial Health in Detroit. Over 500 physicians, as well as management representatives, heard four distinguished panels discuss various aspects of this problem. To the Committee's knowledge, this was the first time that a project of this scope had ever been undertaken by the Association, dealing as it did with the broad ramifications of this problem. Over twenty speakers spoke on a wide range of topics dealing with job absence and answered scores of questions presented by the audience.

The meeting reflected the enormous amount of preparatory work that had gone into the planning of the program and the selection of topics and speakers for the occasion. Two publications were especially prepared for the Conference. One of these, "Company Medical Programs and Work Absence," a compilation of the description of programs in ten companies, was prepared by the staff of the Committee based upon personal visits and interviews with medical directors and management personnel. The other, "A Syllabus on Work Absence," was prepared by the members of the staff of the Occupational Health Program of the Public Health Service at the request of, and in cooperation with, the staff of the Committee. The proceedings of the conference, which are to be published in the near future, are expected to be a basic reference work on the subject, and will undoubtedly receive wide distribution in and outside of the medical profession.

In addition to the foregoing publications, the Committee on Medical Care for Industrial Workers has issued the following publications during the past year: Management Health Centers, Guiding Principles for Management and Union Health Centers, and Report of the Fourth Conference on Medical Care in the Bituminous Coal Mine Area.

GUIDING PRINCIPLES FOR EVALUATING MANAGEMENT AND UNION HEALTH CENTERS

The Colorado State Medical Society introduced a resolution (No. 24) at the Annual Meeting in Chicago during June, 1956, requesting the Councils on Medical Service and Industrial Health to reconsider the guiding principles and to revise them so that they would conform to the Principles of Medical Ethics. In discussing the resolution before the Reference Committee on Insurance and Medical Service, members of the Committee stated their belief that the guiding principles in no way conflicted with the Principles of Medical Ethics. They observed that the Principles of Medical Ethics were in the process of revision and, upon the approval of the revised Principles by the House of Delegates, a review would be made of the guiding principles. The resolution, which was approved by the reference committee and adopted by the House, will be given Committee consideration after the December, 1956, Clinical Meeting.

Committee on Federal Medical Services

The membership of this committee has had one change during the year. Dr. Oscar B. Hunter, Washington, D. C., was selected to replace Dr. Harvey B. Stone of Baltimore. Other members are Drs. Louis M. Orr, chairman, Orlando, Fla.; J. D. McCarthy, Omaha; J. Lafe Ludwig, Los Angeles; Richard L. Meiling, Columbus, Ohio; Vincent W. Archer, Charlottesville, Va.; and Russell B. Roth, Erie, Pa. Since the liaison committee of the Board of Trustees with the American Legion has completed its study and has been discharged, the Committee is now formulating plans to renew its informational program on the Veterans Administration and other Federal medical programs.

MEETINGS DURING YEAR

The Committee on Federal Medical Services met four times in the period from July, 1955, to July, 1956. Meetings were held at Chicago on Oct. 6, 1955, March 16, 1956, and June 9, 1956, the last meeting being held during the June session of the American Medical Association. A special meeting with Public Health Service officers was held Nov. 11, 1955, at Washington, D. C.

LIAISON WITH AMERICAN LEGION

The Board of Trustees at its Miami meeting in 1954 appointed a three-member committee, consisting of Drs. Elmer Hess, David B. Allman and Louis M. Orr, to cooperate with a similar committee from the American Legion. This liaison group and designated American Medical Association staff members held meetings with American Legion representatives throughout 1955 and in January, 1956. The liaison committee presented a report to the Board of Trustees and was discharged by the Board on Feb. 11, 1956. At that time the report of the two groups was referred to the Committee on Federal Medical Services for study.

This Committee studied and reviewed the proposed statement submitted by the liaison groups and concluded that no revision of the fundamental American Medical Association policy concerning Federal medical care for non-service-connected disabilities was required. The committee report was approved by the Board of Trustees and the House of Delegates at the June session in Chicago, with the additional recommendation that the Council on Medical Service, through the Committee on

Federal Medical Services, reconsider the temporary exceptions made for non-service-connected disabilities of neuropsychiatric or tuberculous origin "with a view to adjusting these exceptions in more realistic fashion to the needs of areas in this country where local facilities do not exist for the care of mental disease, tuberculosis, and other chronic disabilities as well." The Committee reported this recommendation to state and county medical societies in its August, 1956, Newsletter and requested comment from local groups as a first step in the recommended survey of current conditions.

FEDERAL MEDICAL SERVICES NEWSLETTER

During the period of activity of the Board of Trustees' liaison committee, the Committee on Federal Medical Services did not publish its Newsletter (April 1955 to May 1956). However, since the liaison committee is now discharged, publication has been resumed, and the Newsletter is now published on a monthly basis. In accordance with the directives of the House of Delegates, it is planned to include all federal medical pro- ns within the scope of the Newsletter rather than veterans' alone. This expansion had begun with the 1955 issues. cts discussed in issues this year thus far include Indian th problems and programs, the Public Health Service, the medical program of the Panama Canal Zone, and the new military dependents' medical care program. In order to reach all members of the profession who are concerned with these subjects, the mailing list for the Newsletter has been expanded. Instead of going only to state veterans' affairs committees, it is now being mailed to all physicians on the mailing list for the American Medical Association Secretary's Letter, and such additional names as are requested by state or local medical societies.

VETERANS MEDICAL CARE FACTBOOK AND SPEAKERS KIT

To assist physicians in preparing talks on the medical profession's policy concerning veterans' medical care the Committee published a Factbook and a Speaker's Kit, the latter designed to accompany a set of film strips or slides prepared for and distributed by the American Medical Association. These publications were based on the statistical material available in 1953 and, hence, some of the data date back to 1951 and 1952. The Committee has prepared a revised edition, combining the functions of both publications, bringing statistical material up to date. This new booklet will be made available to medical society committees and individual physicians.

VETERANS MEDICAL CARE EDUCATIONAL PROGRAM

In accordance with Resolution No. 64, approved by the House of Delegates in June, 1955, the Committee has resumed its educational program. In addition to publication of the Newsletter and the revised version of the Factbook and Speaker's Kit, the committee is considering a second series of meetings to acquaint new members of state medical association veterans' affairs committees with the medical profession's policy and recent developments in veterans' medical care and federal medical services generally. Such meetings, if decided upon, will probably begin in the fall of 1956.

OTHER VETERANS ADMINISTRATION PROGRAMS

The Committee is developing plans for a study of the value of residency training in Veterans Administration hospitals. This will probably be a long-term study, since it will require contacting local private physicians cooperating in the Veterans Administration medical program.

Resolution No. 2, approved in June, 1955, directed the Council and Committee to reexamine the policy in regard to the exemption for veterans suffering from tuberculous disorders of non-service-connected origin with regard to the recent changes in methods of treatment, need for hospitalization, and availability of non-federal beds. The purpose of this reexamination is to determine whether or not there still exists a shortage of adequate facilities for treating such cases sufficient to justify their continued care by the Veterans Administration. The Committee has conducted a study of statistical material concerning the utilization of hospital beds in the United States for tuberculous patients, which seems to indicate some decrease in usage. However, it feels that such a trend is not yet sufficiently definite to permit any specific recommendation and that the study should be continued for at least another year. (This study will now become part of the general study of exceptions to the American Medical Association policy on non-service-connected care recommended by the House of Delegates in its action on the report concerning liaison with the American Legion.)

LIAISON WITH OTHER ORGANIZATIONS

At its October, 1955, meeting the Committee agreed to provide the national office of the National Veterans' Society with the mailing list then in use for the Federal Medical Services Newsletter, comprising all members of state medical association veterans' affairs committees. A copy of this list was accordingly forwarded to the secretary of the National Medical Veterans' Society.

At its March, 1956, meeting the committee discussed liaison with the public relations counsel of the Disabled American Veterans organization. It is expected that further meetings will be held with representatives of this group to discuss matters of mutual interest, particularly rehabilitation programs.

FEDERAL REPORTS ON VETERANS CARE

During the past year, two federal reports have been issued concerning veterans' benefits. A report on "abuses" of the medical program, issued by the House Veterans Affairs Committee, is in two parts. The first discusses abuses of the home town medical care program by fee-basis physicians and dentists. The second part discusses abuses of the Veterans Administration medical care program by non-service-connected veterans: This consists of a General Accounting Office survey which investigated (1) the income and financial status of veterans who said they were "unable to pay", and (2) the actual financial status of veterans as compared with the financial status they reported on the statement appended to their application for admission to Veterans Administration hospitals.

The second report is the report of the Bradley Commission, appointed by the President to investigate nonmedical benefits for veterans and to chart a course for future legislation in this field.

The committee has made an analysis of the report on "VA abuses" issued by the House Veterans Affairs Committee published in its May, 1956, Newsletter. Close examination of the report showed only some 82 cases of abuses by physicians during a period of over a year. It also showed that many of these abuses were not willful, but were due to a misunderstanding of federal regulations or to clerical errors in the physicians' offices.

The Bradley Commission also issued its report, which the Committee has analyzed since this is the first federal commission which has studied the philosophy underlying federal benefits for veterans. The committee's Newsletter 6 is devoted in its entirety to this analysis, and lists not only those statements which apply directly to veterans' medical care but also all 70 recommendations made by the commission on the general subject of veterans' benefits. The Committee on Federal Medical Services is pleased to note that this distinguished commission's discussion of the philosophy underlying veterans' benefits at no point disagrees with the basic policy of the medical profession.

HOME TOWN MEDICAL CARE

Recent reports from various state associations indicate an attempt on the part of the Veterans Administration to curtail the home town medical care program and to abolish the administration of the program by medical societies. This is the program whic provides outpatient care for veterans with service-connected disabilities from physicians of their choice in their own communities. Both the curtailment and abolition of state societies from the administrative area have been justified as an economy measure, although several studies received by the committee indicate that home town care is less expensive than care at the Veterans Administration's own clinics, and that medical society administration is both economical and ably carried on. The committee is continuing its survey of the home town care program and will report on future developments in its Newsletter and annual reports.

INDIAN HEALTH

The Committee has kept a constant check on the progress of the health program for the American Indian. Responsibility for this program was transferred from the Bureau of Indian Affairs of the Department of the Interior to the Division of Indian Health (newly created to accept the responsibility) of the Public Health Service in July, 1955. As has been reported in the Committee Newsletter, the status of Indian health represents one of the great defects in the otherwise glowing picture of American health. The committee held a special meeting with Public Health Service representatives in November, 1955, at which the future plans of the Division of Indian Health were discussed. The Committee will keep informed of progress in this field, and will report on activities in the field of Indian health to the medical profession.

FUTURE ACTIVITIES

The Committee's primary directives from the House of Delegates at present are: (1) To continue the educational program for the physician concerning the medical profession's policy on federal care for veterans and, when feasible, to expand this educational program to include the general public; (2) to expand the educational program to include all federal non-military medical services, rather than veterans' care alone; and (3) to reexamine the American Medical Association policy excepting neuro-psychiatric and tuberculous cases from the restriction on federal care for non-service-connected cases in the light of current adequacy of hospital facilities in certain areas, and to include in this reexamination the needs of other chronically ill veterans.

To implement these directives, the Committee: (1) Has resumed publication of the Federal Medical Services Newsletter on a monthly basis, the contents to include discussion of all federal medical programs within the Committee's scope, including notice of studies concerning federal medical care which are made by other committees of the Council; (2) has revised material utilized by the medical profession in explaining its stand on veterans' medical care, (3) plans to resume regional and/or national meetings of representatives of state medical associations to discuss recent developments in this field; (4) will continue surveys of medical care provided through various federal departments and report to the profession on these programs; and (5) will study, in cooperation with other councils of the American Medical Association and with other professional organizations, the current need for hospital beds for the various chronic diseases and of the adequacy of present facilities.

Committee on Prepayment Medical and Hospital Service

The membership of this Committee remains the same as at the time of the annual report of last year. Committee members are: Drs. Percy E. Hopkins, Chicago, chairman; John Conway, Clovis, N. Mex.; Charles L. Farrell, Pawtucket, R. I.; Quentin Kintner, Port Angeles, Wash., O. B. Owens, Alexandria, La.; Carl F. Vohs, St. Louis; and Council member Carlton E. Wertz, Buffalo, N. Y.

Since the last annual report the Committee has had two called meetings. Both were held in Chicago and the dates were Feb. 11 and 12 and June 12, 1956. In addition, a subcommittee met immediately after the 1955 Clinical Meeting to refine and later approve the publication of "Summary of Physicians' Attitudes Toward Voluntary Health Insurance." This pamphlet, published by the Committee with the sanction of the Council, has received wide distribution and requests for copies are still being received.

VOLUNTARY HEALTH INSURANCE

The insurance mechanisms designed to assist in financing health care are continuing to be utilized by more and more Americans. By the end of 1955, over 107 million persons had some type of hospital expense protection. At that date nearly 92 million persons were insured against part or all of the expense incident to surgical operations, while over 55 million were entitled to benefits for regular medical (as distinguished from major hospital and medical) expenses not involving surgery. Those protected under major expense programs numbered an estimated 5,241,000.

Numerically the increase for 1955 for each category of protection was: Hospitalization 6,169,000; surgical expense, 6,037,000; regular medical, 8,258,000; and major hospital and medical expense, 3,006,000. Again, as during calendar year 1954, the increase in enrollment for all types of benefits was at a rate greater than the rate of increase in the total population. Against the increase in total population (estimated at about 1.9 percent) the number of persons carrying hospital expense benefit protection increased by 6.1 percent. The percentage rate of increase for each of the other categories was: Surgical expense, 7.0; regular medical, 17.5; and major hospital and medical, 134.5.

The above figures as well as those which appear in the following tables were derived from the Preliminary Report on the Annual Survey of The Extent of Voluntary Health Insurance in the United States as released by the Health Insurance Council.

Total Enrollment by Type of Benefit and Type of Insurer

Type of Insurer	*Number of Persons Protected Against:* *Hospital Expense*	*Surgical Expense*	*Regular Medical Expense*
Insurance Company			
Group	39,029,000	39,725,000	20,678,000
Individual	26,706,000	22,445,000	6,264,000
Total Insurance Co.	65,735,000	62,170,000	26,942,000
Duplication estimated[1]	6,081,000	5,525,000	1,911,000
Net Total (insurance)	59,654,000	56,645,000	25,031,000
Blue Cross-Blue Shield[2]	50,726,000	39,165,000	29,451,000
Independent Plans	4,530,000	4,340,000	4,639,000
Grand Total	114,910,000	100,150,000	59,121,000
Less Duplication[3]	7,248,000	8,223,000	3,615,000
Net Total	107,662,000	91,927,000	55,506,000

1—Number indicates those who may carry insurance with more than one company.

2—Includes some plans of those types which may not belong to either Commission.

3—Estimated number of persons who carry both insurance company and Blue Shield-Blue Cross or similar contracts.

Total Payments by Type of Benefit and Type of Insurer

Type of Insurer	*Type of Benefit* *Hospital*	*Surgical-Medical*	*Total*
Blue Shield-Blue Cross	$ 870,000,000	$340,000,000	$1,210,000,000
Insurance Companies	745,000,000	445,000,000	1,190,000,000
Independent Plans	75,000,000	55,000,000	130,000,000
Totals	$1,690,000,000	$840,000,000	$2,530,000,000

Each year the Council on Medical Service through its Committee on Prepayment Medical and Hospital Service contributes to the total survey along with the Blue Shield and Blue Cross Commissions and other interested organizations. These contributions are then collated with the figures reported by insurance companies through their respective trade associations. After all figures are compiled, the totals are reduced so as to eliminate duplication and reflect only the net number of persons protected.

In releasing the survey, it was estimated that by mid-year 110 million persons had hospital expense protection while 94 million had surgical expense benefits and 58 million were eligible for medical benefits other than surgery.

From the standpoint of dollar volumes, the total benefits paid under voluntary health insurance programs reached an all-time high and amounted to approximately 2.5 billion dollars during 1955. That total was for assisting in payment for hospital and medical care. Nearly 600 million dollars was the amount paid in disability benefits, some of which undoubtedly was used in payment for health care. Although the 3.1 billion dollar total involved has no valid relationship to total private expenditures for health care, it nevertheless represents a substantial amount.

MAJOR HOSPITAL AND MEDICAL EXPENSE BENEFITS

As indicated previously, this type of protection reflected the greatest percentage enrollment increase during 1955. It is also the newest type of coverage and, in many respects, still in the experimental stages. In many instances it is written supplemental to some type of basic benefit program. For the most part these efforts include a deductible feature (the amount which the sured pays before the insurer assumes any portion of the risk) combined with an element of co-insurance. Co-insurance is that percentage of the loss which the insured shares with the insurer. When written to supplement a basic plan, the benefits of the basic program may satisfy the deductible amount selected.

Mention was made previously of the combination of the deductible feature and the co-insurance principle. This is the more frequent approach and was adopted by the employees of a large industry recently without a concurrent basic plan. Another program introduced recently on an experimental basis by a Blue Shield plan contains no co-insurance feature with regard to payments for medical care when rendered by a participating physician. The co-insurance principle is applied for certain institutional benefit payments (hospital, etc.) and when treatment is rendered by non-participating physicians.

In preparing its report on this general subject for the 1954 Clinical Meeting, the Committee was aware of several instances wherein it appeared that some members of the profession felt justified in increasing their customary fees when insurance of this type was involved. At that time it was requested that such physicians resist any such tendency, as failure to do so would jeopardize the entire program. The number so insured then was an estimated 1,250,000, which increased by the end of 1955 to 5,241,000 and to a still greater number, approximately 7 million, as this report is being written, which makes it increasingly important that these experiments be permitted to continue without unnecessary complications.

In view of the growth of this type of protection, it is deemed appropriate to refer to that portion of the Council report[1] on this subject for the 1954 Clinical Meeting. It is suggested that that report be reread, but it is desired at this time to quote the concluding paragraph which states:

> Two elements are primarily responsible for determining premiums. One is the frequency (incidence) of occurrence of the contingency insured against. The other is the amount of the benefit. It follows then that normal premiums in this field are predicated in a large measure on normal amounts of benefits. If either claim frequency or claim cost increases, the net result is an increased premium. If both elements increase, it only hastens a higher premium to the insured. A higher premium is always apt to force some buyers out of the market, and for these people financing health care becomes an even greater problem. It should be remembered that insurance does not create any new wealth. It merely assists in conservation. Insurance may conserve the ability of an insured person to fulfill his normal financial obligations. It does not enhance his ability to discharge added responsibilities if they are in the form of increased fees. To use insurance as an excuse to revise professional fees upward is but to contribute to the defeat of its purpose. If these indisputable and self-evident facts are not embraced by the entire membership of the profession, then it will have dealt irreparable harm to the whole movement. Also, any such failure might give impetus to whatever demand now exists for forcing rigid benefit schedules on the profession.

In connection with the problems of unusual charges, the Committee has met and corresponded with the medical directors of some of the companies which have substantial risk exposures. These medical directors have displayed reasonable evidence that there are several instances wherein charges for professional services have not been rendered on the basis of the insured's circumstances independent of the insurance. As the foregoing quotation indicates, insurance, regardless of whether private or nonprofit, does not create new wealth. It merely acts to conserve on existing funds and to transfer normal risks from the individual to the insured group.

Although aware of the existence and availability of grievance committees in many areas, the medical directors responsible for reviewing claims involving the question of usual or customary charges have been hesitant to utilize such approaches. It is the feeling of some that there are other possible approaches which may have less tendency to interfere with traditional patient-physician relationships. The Committee is studying these and related problems with a view toward suggesting preventive as well as corrective programs wherever indicated. The staff continues to receive evidence of what appears to constitute improper practices and is also in the process of compiling data regarding the extent of these practices. When such studies have progressed sufficiently, specific recommendations may be indicated.

SIMPLIFIED CLAIMS FORMS

A considerable number of members of the profession are still interested in the matter of simplified claim forms. The six simplified claims forms developed by the industry and approved by the Council are being utilized increasingly by the insurance companies. One form, ID-1, which received qualified approval, has been amended in keeping with the recommendation of the Council and Committee. In some instances state associations and local societies have deemed it desirable to develop their own forms independently, but this appears to be the exception rather than the rule. It would seem that the Council and Committee have, in collaboration with the insurance industry, fulfilled the request outlined in the earlier resolutions of the House.

Subsequent to the development of these forms, a new problem has arisen. That is the request on the part of some claim administrators that physicians accomplish multiple copies of claim forms. This activity serves to defeat one of the purposes of the simplified blanks which was to reduce the paper work of the physicians. These practices have been called to the attention of the medical directors of the companies involved and the medical directors, in each instance, have indicated that such practices are not at their request. Instances of this practice should be reported to the Council and Committee with sufficient supporting information so that any necessary corrective measures may be taken.

The aforementioned forms are primarily for use in administering benefits involving hospital, surgical and medical expenses and to some extent, loss of income due to disability. Two other sources have since contacted the Committee with respect to claim forms requiring medical information and opinion. One is the life insurance industry in the realm of certifying total and permanent disability. The other is the Bureau of Old Age Assistance, Social Security Administration, regarding the total and permanent disability freeze which was enacted to protect the earning status of social security taxpayers for later benefits in event of such contingency.

With the enactment of H. R. 7225, it is possible that the attention of the Council and Committee will be further indicated since cash payments are anticipated for the totally and permanently disabled at age 50. This legislation will undoubtedly place a new burden upon the profession since eligibility presumably will be based on such disability which is medically determinable.

INSURANCE ABUSES

There are continued reports of insurance abuses under so-called basic plans and distinguished from those mentioned earlier under major hospital and medical expense programs. While some such abuses may be attributable to the profession, it is the belief of the Council and Committee that the insured persons must assume their appropriate share of the responsibility. The tendency of some insured persons to demand hospitalization in order to collect benefits may be due to both improper understanding of the primary purpose of such programs, improper selling, or both.

REVISED STANDARDS

The Committee has accomplished the second draft of suggested revisions of the standards concerning plans approved and/or sponsored by constituent associations or component societies. The complexities of such standards, coupled with the more immediate problems mentioned previously have combined to delay formalized suggestions to the Council. It is contemplated, however, that such suggestions will be forthcoming at a relatively early date.

MISCELLANEOUS

While not charged with any specific responsibility in the program, the Committee has maintained a watchful interest in the problems incident to medical care for dependents of military personnel as embodied in Public Law 569, 84th Congress.

The tenth annual revisions of the Voluntary Prepayment Medical Benefit Plans brochure and supplemental pamphlet, Charts and Graphs, are in progress. The termination of the printing department within the Association headquarters has complicated these revisions somewhat, but it is hoped that any delay attributable to this will be minimal. As in the past, the Council and Committee have authorized the collection of data from other sources in those instances where the plans do not supply the information requested. Also in preparation is a revision of the pamphlet Growth of Voluntary Health Insurance, which continues to be in popular demand.

Committee on Relations with Lay-Sponsored Voluntary Health Plans

Since the last report concerning the activities of this Committee, Dr. J. Stanley Kenney, New York, was appointed to fill the vacancy created by the death of Dr. James Stevenson of Tulsa, Okla. Another vacancy occurred during the year when the Council designee, Dr. A. C. Scott Jr., Temple, Texas, passed away. Other members of the Committee are: Drs. H. Russell Brown, chairman, Watertown, S. D.; George S. Klump, Williamsport, Pa.; F. J. Elias, Duluth, Minn.; Lewis A. Alesen, Los Angeles; and Mr. C. H. Crownhart, Madison, Wis.

Two Committee meetings have been held, both in Chicago, and the dates were March 10 and 11 and June 14, 1956.

The Committee has attempted to keep informed currently regarding developments with respect to those plans which are sponsored by nonmedical groups and are not considered within the proper sphere of interest of other units of the Association. Moreover, the Committee has been in contact with certain constituent associations and component societies concerning problems in this realm.

The statement embodying the scope of interest of the Committee has been revised somewhat since it was last delineated to the House of Delegates during the 1954 Clinical Meeting. To permit the members of the House to evaluate the modification, the 1954 statement is herein set forth and the revision immediately thereafter. The 1954 Clinical Meeting statement was as follows:

> . . . The Committee on Relations with Lay-Sponsored Voluntary Health Plans studies those plans of non-medical sponsorship that are available to the public at large . . .

The following substitute statement has been accepted:

> The scope of interest of this Committee is the study of insurance adaptations and plans sponsored or approved by organizations other than constituent medical associations or component societies and designed to assist in providing and financing health care for subscribers and beneficiaries. Such plans do not include those organized by employer and/or employee groups limited to membership of a union or employees of an industry. Nonoccupational medical care for industrial workers poses special problems and is under consideration by another Committee of the Council.

A suitable definition of the term "lay-sponsored" has been attempted on several occasions. In light of the difficulties encountered to date, the amended statement is proposed to serve both as a tentative definition (until a satisfactory one can be developed) and to delineate more clearly the scope of activity of the Committee.

FIELD STUDIES

Under the supervision of the Committee, preliminary field studies have been undertaken in an effort to identify and summarize the characteristics of those plans which are frequently referred to as "lay-sponsored."

The staff has been instructed to edit summary reports of field studies of a few programs in this category and submit them, after Committee concurrence, to the Council so the Council will be in a position to decide whether they should be published and made available for distribution. The Committee has been and will continue to be in contact with constituent associations and component societies in order to minimize unnecessary duplication of effort and at the same time keep up-to-date information concerning new developments. In this connection, both the Council and the Committee are cognizant of the continuing efforts of the Commission on Medical Care Plans created by the Board of Trustees and concerning itself with all types of mechanisms through which health services are either provided or financed. In view of this, the Committee is proceeding rather deliberately in order to minimize any possible confusion between the activities of the Council Committee and the Commission.

Committee on Aging

Since the 1955 annual report of the Council this Committee has been activated and has a full complement of members consisting of Drs. H. B. Mulholland, chairman, Charlottesville, Va.; Edward L. Bortz, Philadelphia; Henry Holle, Austin, Texas; Wingate M. Johnson, Winston-Salem, N. C.; Cecil Wittson, Omaha; Frederick C. Swartz, Lansing, Mich.; and Theodore G. Klumpp, New York.

COMMITTEE MEETINGS

The first meeting was held in Boston on Nov. 28, 1955. The Committee focused its attention on a general discussion of its purposes and functions. As an initial project it was agreed to ascertain what the state medical associations and county medical societies were doing in reference to "the problems of the aging." Two subsequent meetings have been held, one in Philadelphia on March 19 and 20, 1956, and the other in Chicago on June 11, 1956.

CHANGE IN NAME

During the first meeting of the committee it was the consensus of the members that the scope of their studies should be broader than the field inferred by the title Committee on Geriatrics, which was the name suggested in the resolution recommending such a committee. The committee believes most serious students of aging avoid the term "geriatrics" except for designating individuals far spent in their life content and activities. They agree that the term probably has a certain utility but is not sufficiently stimulating to arouse the interest of members of the medical profession. Accordingly, upon recommendation of the committee and the Council, the House of Delegates in June 1956 approved changing the name to Committee on Aging.

ACTIVITIES OF STATE ASSOCIATIONS AND COUNTY SOCIETIES

One of the "musts" for every committee of the Council on Medical Service is knowledge of and cooperation with similar state and local medical society committees. Consequently, to learn something of the status of committees on aging within medical organization, questionnaires were sent to (1) all state and territorial associations, and (2) those county societies which in replying to the survey of county societies conducted by the Council on Medical Service indicated some formally organized activity pertaining to geriatrics. The response was certainly not encouraging. In fact, with the ever-increasing concern over the aging population and the problems that are bound to arise, the Committee was amazed at the lack of concern, at least official concern, evidenced by the results of this questionnaire. Only 34 of the 48 state associations replied, and 21 or 70.8 per cent of these states indicated they had no committee concerned with this subject; eight states specified they had geriatrics committees; and eight others stated that some other committee handled problems on aging.

A somewhat better situation exists among the county medical societies. Of the 84 societies to which questions were sent, only 45 or 53.6 per cent replied. Thirty two societies, or 71.2 per cent, have geriatrics committees, and in another seven, or 15.4 per cent, this subject comes within the purview of some other committee. Of those replying, six, or 13.4 per cent, have no committee concerned with this subject.

It is apparent that interest in the problems of aging has not yet permeated the organizational structure of the state medical associations or county medical societies and that considerable effort needs to be directed toward increasing this interest.

AREAS FOR STUDY

Discussion and review of the scope of the problems coming within the purview of this Committee have occupied much of the time during the first three meetings. In this review, the Committee has heard from a number of consultants in specialized fields.

Dr. Leo H. Bartemeier, Chairman, Council on Mental Health American Medical Association, Baltimore, Maryland
Nathan Shock, Ph.D., Chief, Gerontology Branch, Department of Health, Education, and Welfare, Public Health Service, Baltimore, Maryland
Dr. S. D. Pomrinse, Medical Director, Chief, Hygiene of Aging, Chronic Disease Program, Division of Special Health Services, Department of Health, Education, and Welfare, Public Health Service, Washington, D. C.

Other consultants in such fields as retirement, health maintenance, and nutrition have been contacted and are to meet with the committee in the future.

In the meantime, to set direction for its own work and to initiate and provide some leadership to medical societies the Committee has set forth the following as its objectives:

1. To explore problems concerned with the medical, biological, psychological, and social aspects of aging;
2. To collect data concerning energy maintenance, fatigue control, and the preservation of specific motivation;
3. To promote research in these areas;
4. To inform the medical profession of the availability of information regarding the aging processes,
5. To stimulate medical society interest in the problems of the aging, and
6. To impress upon the practicing physician the important role he can play by assuming community leadership to enrich the lives of older citizens.

These objectives, together with a preliminary statement, have been published in The Journal.

PUBLICATIONS

To provide some basic background material to be used by state and local committees on aging or geriatrics, a series of articles is planned for The Journal. This series will cover the following areas, with each article to be prepared by a recognized authority in his field.

Nutritional Needs
The Role of Exercise
Posture
Stress and Exhaustion
Health Maintenance
Rehabilitation and Restorative Services
Control of Fatigue
Motivation for Living
Personal Hygiene
Recreation
Housing
The Senior Citizen and His Community
The Oldster and His Doctor
Effect of Early Life Diseases on Aging Processes
Preparation for Retirement

REGIONAL MEETINGS

In view of the need to stimulate interest among physicians and the state and local medical societies the committee has planned to hold its meetings in various parts of the country and discuss the problems in this field with medical society representatives. The first of such regional meetings is scheduled during the Clinical Meeting of the American Medical Association in Seattle. In addition, the committee requested and has been allotted a half day session in the Scientific Assembly for a panel on the problems of the aging. This panel is to be made up of committee members and other speakers well-qualified in their respective fields. The subjects assigned are among those planned for publication in The Journal.

It is hoped that this pilot venture will be sufficiently successful to warrant other regional meetings for the purpose of establishing liaison between the American Medical Association committee and committees in various sections of the country.

Respectfully submitted,

Joseph D. McCarthy, Chairman.
H. B. Mulholland, Vice Chairman.
John Flack Burton.
Reuben B. Chrisman Jr.
Thomas J. Danaher.
Elmer Hess
J. Lafe Ludwig.
Raymond M. McKeown.
Robert L. Novy.
Carlton E. Wertz.
Mr. Thomas A. Hendricks, Secretary.

REPORT OF THE COUNCIL ON CONSTITUTION AND BYLAWS

To the Members of the House of Delegates of the American Medical Association:

Meetings

During the period covered by this report, July 1, 1955, through June 30, 1956, the Council on Constitution and Bylaws has met four times: Once in Chicago on Nov. 4, 1955; once in Boston on Nov. 27, 1955, at the time of the Clinical Meeting; twice in Chicago, June 9, 1956 and June 14, 1956, at the time of the Annual Meeting. Two informal meetings were held jointly with the Judicial Council. Two members of the Council on Constitution and Bylaws, serving on a subcommittee to prepare a revision of the Principles of Medical Ethics, met with a similar subcommittee of the Judicial Council. Since the last annual report, the Council has presented two supplementary reports to the House of Delegates, one at the Boston Meeting and one at the Chicago Meeting.

Amendments

During the 1955 Annual and Clinical Meetings certain changes were made by the House of Delegates in the Constitution and Bylaws of the Association. These changes were as follows:

1. Changed the name of the Section on Dermatology and Syphilology to the Section on Dermatology.
2. Changed the name of the Section on Physical Medicine and Rehabilitation to the Section on Physical Medicine.
3. Changed the name of the Section on Preventive and Industrial Medicine and Public Health to the Section on Preventive Medicine.
4. Authorized the Board of Trustees to select the official who will preside at the general meetings of the Scientific Assembly.
5. Authorized election of section officers at any meeting of the section rather than at the second one only.
6. Rearranged the enumeration of the sections found in the Bylaws so that they now appear in alphabetical order.
7. Provided that Associate Members of the Association shall not be required to pay dues and shall not receive American Medical Association publications except by subscription.
8. Broadened the scope of activity of the Reference Committee on Amendments to the Constitution and Bylaws to include matters pertaining to the Principles of Medical Ethics of the American Medical Association.
9. Increased the membership of the Council on Medical Service.

The Council has prepared and the House of Delegates has approved appropriate alterations of the Bylaws to implement these changes.

Medical Ethics

Probably the most important activity of the Council during the period covered by this report relates to the preparation of a revision of the Principles of Medical Ethics. It will be remembered that the Council submitted a supplementary report to the House of Delegates in Boston which contained a rather lengthy and complicated revision and rearrangement of the Principles. The House recommended that further consideration of the suggestions be laid over until the Chicago meeting in June, 1956, and requested that the suggestions be considered by this Council and the Judicial Council in a joint meeting.

Joint meetings were held by the full Councils as well as by a subcommittee made up of members of both Councils. The result, as the members of the House now know, was the submission at the Chicago session of an entirely new proposal for revision of the Principles of Medical Ethics. The new version was approved by the Judicial Council. It is short, concise and complete. It eliminates superfluous wording and matters of medical etiquette but retains all matters of ethics found in the present Principles.

In response to the request of the Council on Constitution and Bylaws the House of Delegates decided that the new version should lay over until the Seattle meeting before final action is taken.

The members of the Council feel that the Proposed Principles of Medical Ethics submitted to the House of Delegates by this Council with the unanimous approval of the Judicial Council should be approved in substantially the following form; with possible alterations approved by the House of Delegates.

PREAMBLE

These principles are intended to serve physicians, individually or collectively, as a guide to ethical conduct. They are not laws; rather, they are standards by which a physician may determine the propriety of his own conduct. They are intended to aid physicians, in their relationships with patients, with colleagues, with members of allied professions and with the public, to maintain under God, as they have through the ages, the highest moral standards.

Section 1. The prime objective of the medical profession is to render service to humanity with full respect for both the dignity of man and the rights of patients. Physicians must merit the confidence of those entrusted to their care, rendering to each a full measure of service and devotion.

Section 2. Physicians should strive to improve medical knowledge and skill, and should make available the benefits of their professional attainments.

Section 3. A physician should not base his practice on an exclusive dogma or a sectarian system, nor should he associate voluntarily with those who indulge in such practices.

Section 4. The medical profession must be safeguarded against members deficient in moral character and professional competence. Physicians should observe all laws, uphold the dignity and honor of the profession and accept its self-imposed disciplines. They should expose, without hesitation, illegal or unethical conduct of fellow members of the profession.

Section 5. Except in emergencies, a physician may choose whom he will serve. Having undertaken the care of a patient, the physician may not neglect him. Unless he has been discharged, he may discontinue his services only after having given adequate notice. He should not solicit patients.

Section 6. A physician should not dispose of his services under terms or conditions which will interfere with or impair the free and complete exercise of his independent medical judgment and skill or cause deterioration of the quality of medical care.

Section 7. In the practice of medicine a physician should limit the source of his professional income to medical services actually rendered by him to his patient.

Section 8. A physician should seek consultation in doubtful or difficult cases, upon request or when it appears that the quality of medical service may be enhanced thereby.

Section 9. Confidences entrusted to physicians or deficiencies observed in the disposition or character of patients, during the course of medical attendance, should not be revealed except as required by law or unless it becomes necessary in order to protect the health and welfare of the individual or the community.

Section 10. The responsibilities of the physician extend not only to the individual but also to society and demand his cooperation and participation in activities which have as their objective the improvement of the health and welfare of the individual and the community.

Commendation to Dr. Louis A. Buie

The Council cannot conclude its report without expressing its sincere tribute to Dr. Louis A. Buie. Prior to the expiration of his term of office last June, Dr. Buie had been a member and chairman of this Council since its inception and gave generously of his time in the furtherance of its activities. Probably few outside of the Council membership are aware of the hours, thought and devotion he expended in attempting, through the years, to formulate a revision of the Principles of Medical Ethics of which the profession could be proud. His regular and active participation in Council deliberations will be missed by the Council and by the entire Association.

Respectfully submitted,

BRITTON E. PICKETT SR., Chairman.
STANLEY H. OSBORN.
FLOYD S. WINSLOW.
WARREN W. FUREY.
WALTER E. VEST.

REPORT OF THE WOMAN'S AUXILIARY TO THE AMERICAN MEDICAL ASSOCIATION

To the Members of the House of Delegates of the American Medical Association:

The Woman's Auxiliary to the American Medical Association is extremely proud to submit a report of its activities and to extend to the House of Delegates the best wishes of its 74,348 members in all the 48 states, the District of Columbia, and the territories of Alaska and Hawaii. We pledge our continued cooperation in any program or project which the members of the American Medical Association deem suitable for Auxiliary participation.

No other woman's organization has a stronger or a more unifying bond than does the Woman's Auxiliary. First, our membership restrictions require that we be wives of doctors of medicine who hold membership in their respective county and state medical societies and in the American Medical Association. We do have a few members in some states and territories who do not qualify for active membership and who are classified as associate members. These members include those wives whose husbands are members in good standing of their state and county medical societies but who are not members of the American Medical Association. I am happy to report to you that this number is rapidly decreasing, due to pressure brought to bear by wives who wish to hold active rather than associate membership in our Auxiliary. At the annual convention in June, 1956, a new category of membership was included in our Constitution to conform more closely with the membership of the American Medical Association. We now include the wives of service members of the American Medical Association in the Auxiliary membership.

Secondly, because of our close relationship to the medical profession, we have a common purpose. We have never deviated from our original concept of the function of a group such as ours, which is defined as follows in our Constitution: "To assist the American Medical Association in its program for the advancement of medicine and public health."

Fortunately, unity does not carry with it uniformity. There is such a variety of programs and projects in which our states and counties are engaged currently that it would be impossible in the short space alloted to mention them all. However, knowing that you share our pride in the accomplishments of your Auxiliary, we list just a few.

All but one of the states have participated in the financial assistance to medical schools through contributions to the American Medical Education Foundation. This past year we changed our fiscal policy and therefore had no carryover from the previous year's contributions. The 1955-56 Auxiliary contribution to the American Medical Education Foundation was $106,223.23. Since 1952 the Auxiliary has contributed $281,392.84.

Second in popularity among the projects was the sale of *Today's Health.* Subscriptions increased to 57,792 over last year's total of 53,214. Recruitment of nurses and other medical personnel ranked first in the number of counties participating and third in the number of state projects. The total amount for loans to student nurses was $42,475.77; scholarships totaled $100,876.75; for nurses' graduate study $3,050 and for practical nurses $1,929, making a grand total of $148,331.52.

Ninety-three % of the state auxiliaries report programs in safety, rural health and community health studies, and 85% were active in civil defense programs. Forty states are promoting

Course in Practical Electrocardiography.—The New York County Academy of General Practice is sponsoring a course for members of the American Academy of General Practice in practical electrocardiography, Thursdays, 9-11 p. m. for 15 consecutive weeks, commencing Oct. 25 at the Mount Sinai Hospital, 100th Street at Fifth Avenue, New York City. The faculty, under the leadership of Dr. Arthur M. Master, will include Drs. Simon Dack, Arthur Grishman, Harry L. Jaffe, and staff. For information, contact Dr. Joseph A. Pincus, Registrar, 147 W. 55th St., New York 19.

New England Postgraduate Assembly.—The 14th annual New England Postgraduate Assembly will be held at the Hotel Statler, Boston, Oct. 30–Nov. 1. Designed especially for the practicing physician, this year's assembly will feature lectures, symposiums, panels, luncheon panels, round-table discussions, and clinical-pathological conferences. Medical films will be shown. Dr. Robert P. McCombs, Boston, is chairman of the committee arranging the program. Representing their state medical societies on the program are Drs. Stanley B. Weld, Hartford, Conn.; Arthur Ebbert Jr., New Haven, Conn.; Frederick S. Gray, Portsmouth, N. H.; Joseph C. Johnston, Providence, R. I.; Hugh A. Smith, Bangor, Maine; and Philip H. Wheeler, Brattleboro, Vt.

Symposium on Hepatitis.—An International Symposium on Hepatitis Frontiers will be held Oct. 25-27 under the auspices of the Henry Ford Hospital, Detroit. Dr. Charles H. Best, Toronto, Canada, will serve as moderator for the program Thursday morning and Dr. John R. Neefe, Philadelphia, for the afternoon session. The Friday morning program, "Prevention of Hepatitis," will be moderated by Dr. William S. Tillett, New York, and the afternoon session on chemical and physical agents by Dr. Gilbert J. Dalldorf, Albany, N. Y. The banquet is scheduled for 6:30 p. m. at the Sheraton Cadillac. The Saturday morning program on differential diagnosis (Dr. Henry L. Bockus, Philadelphia, moderator) will end with a round-table discussion, as will the afternoon program on management of hepatitis and course and prognosis of hepatitis, for which Dr. Cecil J. Watson, Minneapolis, will serve as moderator.

American Museum of Immigration.—Plans have been announced for an American Museum of Immigration to be housed at the foot of the Statue of Liberty in New York harbor. Its purpose will be to express the gratitude of the countless people of diverse origins who have found freedom, security, and a happier way of life in this country. It will also remind present and future generations of visitors that the American people represent an extraordinary physical and cultural fusion of immigrant and aboriginal races. These purposes will be served by historical exhibits, an auditorium, and other facilities. Since star-shaped Fort Wood, which now surrounds the foot of the statue, has walls 27 feet high and encloses a generous area, the needed space can be provided by a building that need neither extend outside these walls nor rise so high as to obscure the view of the present base of the statue. A public appeal for funds, to be directed from the National Committee Headquarters of the American Museum of Immigration, 270 Park Ave., New York 17, is to open Oct. 28.

Interstate Postgraduate Assembly.—The Interstate Postgraduate Medical Association of North America will hold its assembly Oct. 22-25 in the Municipal Auditorium at Cleveland. Panel discussions have been scheduled on Gastrointestinal Bleeding, Jaundice, and Thyroid Disease. On Monday at 7:30 p. m. Dr. Tom D. Spies, director, Nutrition Clinic, Hillman Hospital, Birmingham, Ala., and professor and head of the department of nutrition and metabolism, Northwestern University Medical School, Chicago, will deliver an address, "The Influence of Nutritional Processes on Aging." At the same time on Tuesday Dr. Benjamin Spock, visiting professor of child development, Western Reserve University School of Medicine, Cleveland, will consider "Sleep Problems in the Early Years." A dinner is scheduled for Wednesday at 7 p. m., at which Dr. Alton Ochsner, New Orleans, will deliver the presidential address, "The Value of Postgraduate Education." Scientific and technical exhibits will be on display.

Heart Association Meets in Cincinnati.—The annual meeting and the 29th annual scientific sessions of the American Heart Association will take place at the Netherland Plaza Hotel, Cincinnati, Oct. 27–Nov. 2. The Saturday morning session will close with presentation of the Lewis A. Conner Memorial Lecture, "Functional Pathology of the Pulmonary Vascular Tree in Congenital Cardiac Disease," by Jesse E. Edwards, Rochester, Minn., and the afternoon session on clinical cardiology with a panel on selection and management of patients for cardiac surgery. The George E. Brown Memorial Lecture, "Oxygen Tension of Tissues in Vivo," by Hugh Montgomery, Philadelphia, is scheduled for Sunday morning. The afternoon session on clinical cardiology will include a panel on management of refractory congestive heart failure. On Monday afternoon the panel title will be "Recognition and Management of Cardiac Arrhythmias." A symposium, "Rehabilitation of the Cardiac Patient," is scheduled for the general session Monday morning.

National Medical Association.—At the 61st annual convention of the National Medical Association, the Hotel New Yorker, New York City, Aug. 13-16, the Dickerson-Morman Memorial Lecture, "Lymphosarcoma of the Orbit," was delivered by Dr. Howard P. Venable, St. Louis. At the Tuesday morning session, after the presidential address by Dr. August C. Terrence, Opelousas, La., Dr. Paul D. White, Boston, presented "Epidemiological Research in Cardiovascular Diseases." The public meeting Tuesday evening opened with greetings by Dr. Louis H. Bauer, New York, past-president, American Medical Association, followed by an address by Thurgood Marshall, LL.B., New York, chief legal counsel, National Association for the Advancement of Colored People. Dr. Vivian M. Wiles, New York, served as moderator for a urology symposium; Dr. Vaughan C. Mason, New York, as moderator for a symposium on the toxemias of pregnancy; and Dr. J. Everard Carey, New York, as moderator for a panel discussion on hypnosis in medicine and dentistry. The sessions ended with a clinical pathological conference followed by a panel on the cervix and fundus uteri, moderated by Dr. Peter M. Murray, New York.

Sloan Foundation Scholarships.—The Alfred P. Sloan Foundation has announced the names of 58 winners of scholarships and, simultaneously, an expansion of its scholarship program. Originally limited to some 100 scholarship stipends tenable at 4 institutions, the program in the future will embrace 13 colleges and universities and make awards to some 240 students. By 1960, when the scholarship program is fully operative, it is anticipated that the foundation's annual expenditure will exceed $420,000 and that its total commitment for the program will be in excess of one million dollars. Individual awards under the scholarship program range from $200 to $2,000 a year. Scholarship awards are renewable for three additional years if the winner of the scholarship maintains the standards prescribed by the institution in which he is enrolled. The foundation, established in 1934 by Mr. Alfred P. Sloan Jr., former president and chairman of the board of the General Motors Corporation, has been active in various fields, including economic education and research, cancer and other forms of medical research, business education, and the promotion of pure research in the physical sciences.

Hans Zinsser Memorial Fund.—The Hans Zinsser Memorial fund of the Harvard University School of Public Health, established by friends, colleagues, and students of the late Dr. Hans Zinsser (1878-1940), is to be "allowed to accumulate until the income therefrom has become sufficient to be devoted effectively to purposes in keeping with Dr. Zinsser's deep concern for human health improvement. . . . It is intended, therefore, that the Zinsser Fund could be used in any part of the university, its scope to include any disease or condition which may from time to time constitute a recognized peril to human health. Support for promising young scientists, support of field or laboratory projects and awards for outstanding achievements by students and research workers in the health field are various ways which have been suggested for utilizing the Zinsser Fund . . . the Fund . . . will be administered by the Dean of the Faculty of Public Health. He will receive applications and proposals for use of the income and will recommend to the President and Fellows of Harvard College how it shall be allocated. . . ." Contributions to the Hans Zinsser Fund may be sent to the Secretary, Harvard School of Public Health, 55 Shattuck St., Boston 15. Checks should be made payable to Harvard University.

Regional Cancer Conference.—The 10th Southwest Regional Cancer Conference will be held at the Hilton Hotel, Fort Worth, Texas, Oct. 26-27. Friday at 8:10 p. m. Dr. Charles T. Ashworth, Fort Worth, will moderate a tumor clinic, in which the participants will be Drs. William A. D. Anderson, Miami, Fla.; W. Emory Burnett, Philadelphia; and Vincent P. Collins, Houston, Texas. Saturday morning will be devoted to a symposium on epithelial tumors of the chest, which will include presentation of "Pathology of Benign and Malignant Epithelial Chest Tumors" by Dr. Anderson; "Diagnosis and Surgical Management of Epithelial Chest Tumors" by Dr. Burnett; and "Radiologic Diagnosis and Therapy of Epithelial Chest Tumors" by Dr. Collins. Dr. Francis C. Coleman, Des Moines, Iowa, will speak on "Role of the Pathologist in Medical Practice in Hospitals" at the noon luncheon. At the afternoon symposium on nonepithelial tumors of the chest, Dr. Anderson will discuss "Common and Uncommon Nonepithelial Chest Tumors," Dr. Burnett will present "Surgical Problems in Nonepithelial Chest Tumors," and Dr. Collins will speak on "Radiologic Diagnosis and Therapy of Nonepithelial Chest Tumors." Texas Christian University will meet the University of Miami in a football game at Amon Carter Stadium, Saturday, 8 p. m.

Life Insurance Medical Directors Meeting.—The 65th annual meeting of the Association of Life Insurance Medical Directors of America will be held at the Roosevelt Hotel, New Orleans, Oct. 23-25, under the presidency of Dr. Ralph R. Simmons, Des Moines, Iowa. Tuesday morning Dr. Francis R. Dieuaide, New York, scientific director, Life Insurance Medical Research Fund, will present "Recent Developments in Our Knowledge of the Major Types of Cardiovascular Disease," and Dr. Jacob A. Bargen and Mr. Robert P. Gage, Rochester, Minn., will consider "Survival Rates and Mortality Studies: Chronic Ulcerative Colitis and Regional Enteritis with Comments on Other Ulcerative Lesions of the Digestive Tract." The following presentations have been scheduled for Wednesday:

Aspects of Vectorcardiography, George E. Burch, New Orleans.
The Double Master's Test—A Study on 300 Normal Males, Frank J. McGurl and Raymond L. Dross, Houston, Texas.
The Value of the Double Standard Two-Step Exercise Test in the Detection of Coronary Disease: A Clinical and Statistical Follow-Up Study of Military Personnel and Insurance Applicants, George P. Robb, Mr. Herbert H. Marks, New York, and Col. Thomas W. Mattingly, Washington, D. C.
Natural History of Atherosclerosis, Russell L. Holman, New Orleans.
Cancer—The Challenger, Eugene V. Higgins, New York.

The annual reception and banquet will be held Wednesday at 6 p. m. The sessions will close Thursday morning with the following symposium on health, accident, and major medical underwriting:

Economic Tolerance, Mr. P. C. Irwin, Des Moines, Iowa.
Major Medical Insurance—*Its Development and Problems*, Mr. Joseph F. Follman Jr., New York.
The *Role of the* Medical *Director in* Areas of Major Medical Insurance, William J. McNamara, New York.
Non-Cancellable and Guaranteed Renewable Insurance—Underwriting Considerations, Joseph C. Horan, New York.

Society for Crippled Children.—The annual convention of the National Society for Crippled Children and Adults will be held at the Hotel Statler, Washington, D. C., Oct. 28-31. Among the speakers at the Monday morning session will be Dr. Walter P. Blount, Milwaukee, who will speak on "The Conquest of the Crooked Back" and Dr. Irving S. Cooper, New York, who will discuss "Achievement Through Neurosurgery." The Virginia Society for Crippled Children and Adults will hold its annual dinner meeting in the South American Room at 7:30 p. m. "A Decade of Progress in Cerebral Palsy: 1946-1956" will be considered Tuesday morning by a panel consisting of Dr. George G. Deaver, New York, William M. Cruickshank, Ph.D., Syracuse, N. Y., Dr. Meyer A. Perlstein, Chicago, and Dr. Winthrop M. Phelps, Reisterstown, Md. A demonstration by the District of Columbia Society for Crippled Children, showing its clinical therapy and education program, will follow. Arthur S. Flemming, director, Office of Defense Mobilization, Executive Office of the President, Washington, D. C., will be the speaker at the annual banquet in the Presidential Ballroom, 7:30 p. m., Tuesday. The Wednesday morning session will include "Health, Education, and Welfare Speak—Partnership in Rehabilitation," under the chairmanship of Dr. Elmer Hess, Erie, Pa., immediate past-president of the American Medical Association, with Drs. Leroy E. Burney and Martha M. Eliot, Romaine Mackie, Ph.D., and Mary Switzer, Washington, D. C., as participants. "Keys to the Rehabilitation Gateway—A Pageant on Prostheses and Appliances," presented *in cooperation with* Orthopaedic Appliance and Limb Manufacturers Association, will follow and will feature aids to the handicapped dating from *the 1906 antiques* to the 1956 modern appliances. A demonstration and tour of the National Institute of Neurological Diseases and Blindness, Clinical Center, Bethesda, Md., will take place 2:15-4:30 p. m., and a film theater will be featured, 2:30-4:30 p. m.

Medical Research Fellowships.—The division of medical sciences of the National Academy of Sciences–National Research Council will accept applications for postdoctoral research fellowships for 1957-1958 until Dec. 1, 1956. *Details may be obtained from* the Division of Medical Sciences, Room 310, National Research Council, 2101 Constitution Ave. N. W., Washington 25, D. C., for the following groups of fellowships, awarded and administered by the *division's medical fellowship board*: (1) national research fellowships in the medical sciences, supported since 1922 by the Rockefeller Foundation; (2) Donner fellowships for medical research, made possible by a new grant from the Donner Foundation; and (3) *Markle fellowships in the medical sciences*, provided through a new appropriation of the John and Mary R. Markle Foundation. These programs are designed to offer research experience in the basic medical sciences for persons who *look forward to careers in academic medicine and investigation.* Fellows are expected to devote their entire time to research at the fundamental level. Funds are not available for support of those who are seeking practical experience in the clinical field. Awards are open to citizens of the United States and Canada who hold the M.D., or Ph.D. degree or the equivalent. Ordinarily fellowships are not granted to persons over 35 years of age. Details may be obtained for fellowships in radiological research, administered for the James Picker Foundation by the division's committee on radiology. Applications will also be entertained from candidates seeking to gain research skills leading to investigative careers in the field of radiology. While persons from closely related disciplines are eligible to apply, candidates whose training has been directly in the field of radiology will receive preference under this program. Candidates must hold the M.D., Ph.D., or Sc.D. degree or the equivalent and should ordinarily be not more than 35 years of age. There are no limitations with respect to citizenship of applicants.

Meeting of Medical Clinics.—The American Association of Medical Clinics will hold its annual meeting Oct. 26-28 at the Mayflower Hotel, Washington, D. C., under the presidency of Dr. R. Franklin Jukes, Akron, Ohio. The program for Saturday morning includes "The Opportunity for Genetic Research in a Clinic Group" by Dr. Charles E. Jackson, Bluffton, Ind.; "Cultivation of Personal Relationships with Clinic Patients" by Dr. Donald N. Sweeny, Detroit, Mich.; and "The Psychiatrist in a Medical Clinic" by Dr. Donald D. Jackson, Palo Alto, Calif. Workshops will precede the luncheon at 12:30 p. m., at which Dr. Lowell T. Coggeshall, special assistant for health and medical affairs to the Secretary, Department of Health, Education, and Welfare, Washington, D. C., will discuss "Adequate Medical Care for the American People." The presidential address will be delivered at 2 p. m. A cocktail hour (courtesy E. R. Squibb and Sons) is scheduled for 5:30 p. m. Sunday *morning* will be devoted to a panel, "How Can Group Practice Give Better and More Economical Service to the Chronically Ill and Aged?"

The following speakers will participate in the panel:

Thomas H. Fox, *Clifton Springs Sanitarium* and Clinic, Clifton Springs, N. Y.
Theodore G. Klumpp, New York, president, Winthrop Laboratories, and member, A. M. A. Committee on Aging.
Henry B. Mulholland, Charlottesville, Va., chairman, A. M. A. Committee on Aging.
Edward J. Stieglitz, Washington, D. C., consultant in geriatrics to the Veterans *Administration and to St.* Elizabeth's Hospital.
Russel V. Lee, Palo Alto Medical Clinic, Palo Alto, Calif., moderator.

Guest speaker at the luncheon, 12:30 p. m., will be Dr. Charles F. Shook, medical director, Owens-Illinois Glass Company, Toledo, Ohio, whose *subject* will be "Our Medical Interest—the Industrial Employee." "Part-Time Physicians or Consultants—Their Place *in Clinics*" *by Dr.* Benjamin deF. Lambert, Lowell, Mass., will precede a panel on methods of lowering malpractice and liability incidents and insurance rates, moderated by Dr. George Plain, South Bend, Ind., which will have as participants Dr. M. Meredith Baumgartner, Janesville, Wis.; Mr. Ralph O. Claypoole Sr., Philadelphia; Mr. Edwin J. Holman, Chicago; and Mr. Theodore Wiprud, Washington, D. C.

Cancer Society Meeting.—The annual scientific session of the American Cancer Society will be held at the Park Sheraton Hotel, New York, Oct. 29-30, the subject of the session being "Endocrines and Cancer." "Estrogens and Tumorigenesis" will be the subject of the Monday morning session under the chairmanship of Dr. Robert L. Noble, professor of medical research, University of Western Ontario, London, Canada. Presentations during the session will include "Urinary Estrogens and Their Quantitative Determination" by Dr. Guy F. Marrian, professor of chemistry, University of Edinburgh, Edinburgh, Scotland, and "Hormonal Aspects in the Genesis of Mammary Cancer" by O. Muhlbock, chairman, scientific board and head, biological department, Netherlands Cancer Institute, Amsterdam, Netherlands. Monday afternoon Gregory G. Pincus, Sc.D., director of laboratories, Worcester Foundation for Experimental Biology, Shrewsbury, Mass., will serve as chairman for the session entitled "Androgens and Corticosteroids." "Mammary Cancer" will be the topic of the Tuesday morning session (Dr. Charles B. Huggins, director, Ben May Laboratory for Cancer Research, University of Chicago, chairman), which will include presentation of "The Role of Adrenalectomy in Cancer of the Breast" by Sir Stanford Cade, surgeon, Westminster Hospital, and lecturer in surgery, Westminster Medical School, London, England, and "The Role of Hypophysectomy in Cancer of the Breast" by Dr. Rolf Luft, associate professor of endocrinology and director, department of endocrinology, Karolinska Institut, Serafimerlasarettet, Stockholm, Sweden. "Cancer of Other Sites" will be the main topic at the afternoon session under the chairmanship of Dr. Cornelius P. Rhoads, scientific director, Memorial Center for Cancer and Allied Diseases, New York. Among the papers presented will be "The Role of Hormones in Cancer of the Uterine Cervix" by Dr. Hans L. Kottmeier, director of the gynecological department, Radiumhemmet, Stockholm, Sweden, and "Relationships Between Hormonal Changes in Pregnancy and the Development of 'Mixed Carcinomas' of the Uterine Cervix" by Alfred Glucksmann, Strangeways Research Laboratory, Cambridge, England. The program includes presentation of 26 additional papers.

CANADA

Conference on Industrial Pulmonary Diseases.—The 1956 annual conference of the McIntyre Research Foundation on silicosis and other industrial pulmonary diseases will be held at the King Edward Hotel, Toronto, Oct. 22-24.

EXAMINATIONS AND LICENSURE

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination* Montgomery, June 18-20. Sec., Dr. D. G. Gill, State Office Bldg., Montgomery 4.

Arizona:° *Examination and Reciprocity.* Phoenix, Oct. 17-19. Ex. Sec., Mr. Robert Carpenter, 411 Security Bldg., Phoenix.

Arkansas:° *Examination and Reciprocity.* Little Rock, Nov. 8-9. Sec., Dr. Joe Verser, Harrisburg.

California: *Written Examination.* Sacramento, Oct. 15-18. *Oral Examination for Reciprocity Applicants.* Los Angeles, Nov. 17. Sec., Dr. Louis E. Jones, 1020 N Street, Sacramento.

Colorado:° *Reciprocity.* Denver, Oct. 9. Final date for filing application was Sept. 10. *Examination.* Denver, Dec. 4-5. Final date for filing application is Nov. 2. Sec., Dr. Samuel H. Brown, 831 Republic Bldg., Denver 2.

Connecticut:° *Examination.* Hartford, Nov. 13-15. Sec., Dr. Creighton Barker, 160 St. Roman St., New Haven.

Delaware: *Examination.* Dover, Jan. 8-10. *Reciprocity.* Dover, Jan. 17. Sec., Dr. Joseph S. McDaniel, 225 So. State St., Dover.

District of Columbia:° *Examination.* Washington, Nov. 13-14. Deputy Director, Mr. Paul Foley, 1740 Massachusetts Ave., N.W., Washington 6.

Florida:° *Examination.* Miami Beach, Nov. 25-27. Sec., Dr. Homer L. Pearson, 901 N.W. 17th St., Miami 36.

Georgia. *Examination and Reciprocity* Atlanta, Oct. 9-11. Sec, Mr. Cecil L. Clifton, 111 State Capitol, Atlanta 3.

Idaho: *Examination and Reciprocity* Boise, Jan 7-9. Exec Sec, Mr Armand L. Bird, 364 Sonna Bldg., Boise.

Iowa:° *Examination.* Des Moines, Dec. 3-5. Ex. Sec, Mr. Ronald V. Saf, State Office Bldg, Des Moines.

Kansas: *Examination and Endorsement* Topeka, Dec. 12-13 Sec, Dr Lyle F. Schmaus, 872 New Brotherhood Bldg, Kansas City

Kentucky: *Examination.* Louisville, Dec. 10-12. Sec., Dr Russell Teague, 620 South Third St, Louisville 2.

Louisiana. *Examination and Reciprocity* New Orleans, Dec 6-8 Sec, Dr Edwin H. Lawson, 930 Hibernia Bank Bldg, New Orleans 12

Maine. *Examination and Reciprocity* Portland, Nov 13-14. Sec, Dr. Adam P. Leighton, 192 State St, Portland.

Maryland· *Examination* Baltimore, Dec. 11-14 Sec, Dr. Lewis P Gundry, 1211 Cathedral St., Baltimore 1.

Massachusetts. *Examination* Boston, Jan. 15-18. Sec, Dr. *Robert C Cochrane, State Office Bldg*, Boston

Michigan:° *Examination* Lansing, Oct. 10-12 Sec, Dr. E. C *Swanson, 118 Stevens T. Mason Bldg*, West Michigan Ave., Lansing 8

Minnesota:° *Examination and Reciprocity* Minneapolis, Oct 16-18 Sec, Dr. *F. H. Magney, 230 Lowry* Medical Arts Bldg, St Paul 12

Mississippi: *Reciprocity.* Jackson, December. *Examination* Jackson, June *Asst. Sec., Dr. R. N.* Whitfield, Old Capitol, Jackson.

Missouri: *Examination and Reciprocity.* Kansas City, Oct 25-27. Ex. Sec., Mr. John A. Hailey, Box 4, State Capitol Bldg, Jefferson City.

Nebraska:° *Examination* Omaha, June 17-19. Director, Mr. Husted K *Watson, Room 1009, State Capitol Bldg.*, Lincoln 9

New Jersey: *Examination* Trenton, Oct. 16-19. Sec, Dr Patrick H Corrigan, 28 West State St., Trenton.

New Mexico ° *Examination and Reciprocity* Santa Fe, Nov 19-20 Sec, Dr. R. C. Derbyshire, 227 East Palace Ave, Santa Fe

New York. *Examination* Albany, Buffalo, New York City and Syracuse, Oct. 16-19. Sec, Dr. Stiles D. Ezell, 23 S Pearl St, Albany.

North Dakota: *Examination and Reciprocity* Grand Forks, Jan. 2-5 Sec., Dr. C. J. Glaspel, Grafton.

Oregon.° *Reciprocity* Portland, Oct. 19-20. *Examination* Portland, January. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg, Portland 4

South Dakota.° *Examination.* Sioux Falls, Jan 21-22 Ex Sec, Mr John C. Foster, 300 First National Bank Bldg., Sioux Falls.

Texas:° *Examination and Reciprocity.* Fort Worth, Dec. 6-8. Applications for reciprocity must be complete and on file at least thirty days prior to the December meeting, and applications for examination must be complete and on file at least ten days prior to the meeting date. Sec, Dr M. H. Crabb, 1714 Medical Arts Bldg, Fort Worth 2.

Utah: *Reciprocity.* Salt Lake City, Nov. 20. *Examination* Salt Lake City, July 11-13. Director, Mr. Frank E. Lees, 324 State Capitol Bldg, Salt Lake City 1.

Virginia: *Examination and Reciprocity* Richmond, Dec 5-7. Address Secretary to the Board, 631 First St, S W, Roanoke.

Washington.° *Examination and Reciprocity* Seattle, Jan 14-16 and Jan 12. Sec., Mr. Edward C. Dohm, Olympia.

West Virginia. *Reciprocity.* Charleston, Oct. 8. *Examination* Charleston, January. Sec., Dr. Newman H. Dyer, State Office Bldg. No 3, Charleston 5.

Wisconsin:° *Reciprocity.* Madison, Oct. 19 and Jan. 9. *Examination* Madison, Jan. 8-10. Sec., Dr. Thomas W. Tormey, Jr, 1140 State Office Bldg, 1 West Wilson St., Madison.

Alaska.° On application in Anchorage, Fairbanks, Juneau and other towns. Sec., Dr. W. M. Whitehead, 172 South Franklin St, Juneau

Guam. *Subject to Call.* Act. Sec., Dr. S. F. Provencher, Agana

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Colorado. *Examination and Reciprocity* Dec 5-6, Lincoln and Denver *Sec., Dr. Esther B Starks, 1459 Ogden St., Denver 18*

Connecticut: *Examination* New Haven, Oct. 13. Exec. Asst, Miss Regina *G. Brown, 258 Bradley St, New Haven 10.*

District of Columbia: *Examination* Washington, Oct. 22-23 Deputy *Directors, Mr. Paul Foley, 1740 Massachusetts Ave, N.W*, Washington

Iowa: *Examination* Des Moines, Oct. 9. Sec, Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination and Reciprocity.* Ann Arbor and Detroit, Oct 12-13. Sec., Mrs. Anne Baker, 116 Stevens T. Mason Bldg, Lansing.

New Mexico: *Examination.* Santa Fe, Oct. 21. Sec, Mrs Marguerite Cantrell, Box 1522, Santa Fe.

Oregon: *Examination* Portland, Dec. 1. Dr. Earl M. Palett, Sec, State Board of Higher Education, Eugene.

South Dakota: *Examination.* Vermillion, Dec. 7-8. Sec., Dr. Gregg M *Evans, 310 E. 15th St*, Yankton.

Texas. *Examination.* Austin and Houston, Oct. 19-20. Sec, Bro Raphael *Wilson, 407 Perry-Brooks Bldg*, Austin.

Washington: *Examination* Seattle, Jan. 9-10. Sec, Mr. Edward C. Dohm, Olympia.

Wisconsin: *Examination.* Milwaukee, Dec. 1. Sec, *Dr. W. H.* Barber, 621 Ransom St., *Ripon.*

Alaska: *Examination and Reciprocity.* Anchorage and Juneau, first week of February, April, June, August and November. Sec, Dr. C Earl Albrecht, Box 1931, Juneau.

°Basic Science Certificate required.

DEATHS

Richards, Esther Loring ⊕ Baltimore; born in Holliston, Mass., June 6, 1885; Johns Hopkins University School of Medicine, Baltimore, 1915; associate professor emeritus of psychiatry at her alma mater, and served as lecturer in mental hygiene at the Johns Hopkins University School of Hygiene and Public Health; member of the American Psychopathological Association, American Academy of Science, American Academy of Political and Social Science, American Psychiatric Association, and the American Association for the Advancement of Science; fellow of the American Public Health Association; cited as one of the 10 outstanding American women of the year by the Woman's National Press Club; served on the staff of the Baltimore City Hospitals; in April, 1954, her portrait was presented to the Johns Hopkins Hospital, where she was a psychiatrist and where, for many years, she was associated with the Henry Phipps Clinic; author of "Behavior Aspects of Child Conduct" and "Introduction to Psychobiology and Psychiatry"; received the honorary doctor of science degree from Mount Holyoke College of South Hadley, Mass., in 1926; died July 6, aged 71, of cancer.

Reeves, Rufus Sargent ⊕ Philadelphia; born in Philadelphia Aug. 1, 1882; University of Pennsylvania School of Medicine, Philadelphia, 1912; past-president of the Philadelphia County Medical Society; founder and first director of the society's Postgraduate Institute, and for this achievement was given the I. P. Strittmatter Award, a gold medal and scroll, on May 2, 1941; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians and the Pennsylvania Public Health Association; treasurer and at one time president of the medical alumni of the University of Pennsylvania; director of the department of public health from 1944 to 1952; formerly contract physician to the U. S. Army Signal Corps Depot; at one time on the faculty of his alma mater; veteran of World War I; on the courtesy staffs of Episcopal and St. Agnes hospitals; in 1950 received an honorary degree of doctor of science from Hahnemann Medical College and Hospital; died in the Hospital of the University of Pennsylvania July 13, aged 73, of metastatic carcinoma of the lung.

Shockley, Major Augustus Wroten ⊕ Brigadier General, U. S. Army, retired, Tampa, Fla.; born in Fort Scott, Kan., May 13, 1874; Kansas City (Mo.) Medical College, 1898; veteran of the Spanish-American War; entered the regular Army in 1900 and advanced through the various grades until he was appointed brigadier general in 1935; retired Feb. 28, 1937; director of the Field Service and Correspondence School for Medical Officers, Fort Leavenworth, Kan., from August, 1915, to September, 1917; instructor, General Service Schools, Fort Leavenworth, Kan., from May, 1919, to June, 1922; later commanding officer, William Beaumont Army Hospital, El Paso, Texas, and surgeon and professor of military hygiene of the U. S. Military Academy; in command of the Letterman Army Hospital in San Francisco to the time of his appointment as assistant to the surgeon general of the Army; awarded the Distinguished Service medal; an officer of the Legion of Honor of France; fellow of the American College of Surgeons; died at the MacDill Air Force Base, Tampa, Fla., May 10, aged 81, of abscess of the lung and arteriosclerosis.

Hodges, Francis Traill ⊕ San Francisco; born in Indianapolis Aug. 17, 1907; Indiana University School of Medicine, Indianapolis, 1933; member of the American Academy of General Practice; president of the California Academy of General Practice; interned at the U. S. Marine Hospital, Passavant Memorial Hospital, Chicago Maternity Center, and the Chicago Lying-in Hospital and Dispensary in Chicago; during World War II served as a commander of the U. S. Naval Reserve in the South Pacific; served as surgeon on the Grace and Dollar Lines in the Merchant Marine; past-president of the California Physicians' Service; died in the Santa Barbara (Calif.) Cottage Hospital, Aug. 15, aged 48, of a broken neck suffered in a diving accident.

Ramsaur, Jackson Townsend ⊕ Gastonia, N. C.; born in Montreal Nov. 16, 1907; Rush Medical College, Chicago, 1934; specialist certified by the American Board of Preventive Medicine; past-president of the Gaston County Medical Society; past vice-president of the Western North Carolina Public Health Association; past-chairman of the health officers' section of the North Carolina Public Health Association and at the annual convention in 1952 received "honorable mention for meritorious achievement in public health"; since 1950 county health officer; on the staffs of the Garrison General and Gaston Memorial hospitals; died June 28, aged 48, of cerebral accident and hypertensive cardiovascular disease.

Crow, Thomas A., Manitou, Ky.; Hospital College of Medicine, Louisville, 1896; died in Madisonville May 18, aged 86, of arteriosclerosis.

Evans, Thomas Asa E., Farmers, Ky.; American Eclectic Medical College, Cincinnati, 1895; University of Louisville (Ky.) Medical Department, 1907; for many years director of the Rowan County Health Department; served as judge of Rowan County; died in Morehead March 27, aged 82, of arteriosclerosis.

Fineberg, Bernard Jacob, Jersey City, N. J.; Columbia University College of Physicians and Surgeons in New York City, 1923; served as police physician; medical examiner for the city police department; on the staff of the Fairmount Hospital; died June 29, aged 57, of acute coronary occlusion.

⊕ Indicates Member of the American Medical Association.

Holdren, C. W., Athens, W. Va.; Baltimore University School of Medicine, Baltimore, 1892; died July 17, aged 88, of a heart attack.

Jones, Errol Thomas, St. Clair, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1914; veteran of World War I; secretary and past-president of the school board; on the courtesy staff of the A. C. Milliken Hospital, Pottsville, where he died June 13, aged 65, of arteriosclerotic heart disease, emphysema, and pulmonary fibrosis.

Kenneth, Milena Anna, North Miami, Fla.; Université de Paris Faculté de Médecine, France, 1951; interned at St. Vincent's Hospital in New York City, where she served a residency at St. Luke's and Willard Parker hospitals, and at the Jewish Hospital in Brooklyn, N. Y.; died June 30, aged 31.

Lee, Frank Shin ⊕ Honolulu, Hawaii; Medical Department of St. John's University, Shanghai, China, 1938; member of the American Academy of General Practice; died March 24, aged 50, of cerebral hemorrhage and nasopharyngeal cancer with general metastases.

Lewis, Cyril Ettrick, Auburn, Calif.; Jefferson Medical College of Philadelphia, 1904; an associate member of the American Medical Association; served on the staff of the Highland General Hospital, where he died July 15, aged 78, of cardiovascular disease.

Lewis, William Bryant, Houston, Texas; Vanderbilt University School of Medicine, Nashville, Tenn., 1913; for many years served as a medical missionary in the Belgian Congo, where he built the Lewis Memorial Hospital in the Tunda Village; died April 15, aged 64.

Maxwell, John Boal ⊕ Logansport, Ind.; Rush Medical College, Chicago, 1890; served on the staff of St. Joseph Hospital, where he died July 5, aged 97, of hypostatic pneumonia.

McGuire, John Jett ⊕ Pensacola, Fla., Tulane University of Louisiana School of Medicine, New Orleans, 1919; specialist certified by the American Board of Radiology; member of the Radiological Society of North America and the American College of Radiology; on the staffs of the Santa Rosa Hospital in Milton and the Baptist and Escambia General hospitals; on the courtesy staff of Sacred Heart Hospital; died July 1, aged 61, of coronary occlusion.

Mittelman, Joseph Herman, New York City; University of the City of New York Medical Department, New York City, 1894; died May 29, in Brooklyn, aged 95.

Nathan, Edward Meyer ⊕ Quincy, Mass.; Tufts College Medical School, Boston, 1932; on the staffs of the Beth Israel Hospital in Boston and the Quincy City Hospital; died June 17, aged 48, of cerebral hemorrhage.

Noland, Stacy Taylor, Rehoboth Beach, Del.; College of Physicians and Surgeons, Baltimore, 1914; served in France during World War I; past-president of the Arlington County (Va.) Medical Society; practiced in Arlington, Va.; died in the Garfield Memorial Hospital, Washington, D. C., July 17, aged 66, of bronchogenic carcinoma.

North, Charles David ⊕ Rockland, Maine; Medical School of Maine, Portland, 1907; served as Knox County medical examiner, health officer of Rockland, and city physician; on the staff of the Knox County General Hospital; died June 27, aged 76, of heart disease.

O'Dwyer, William, Madison, Wis.; Rush Medical College, Chicago, 1901; died June 15, aged 79, of heart disease and bronchopneumonia.

O'Keefe, Charles Darrell ⊕ St. Louis; Washington University School of Medicine, St. Louis, 1918; assistant professor of clinical obstetrics and gynecology at his alma mater; on the staffs of the Barnes and St. Louis Maternity hospitals and St. Luke's Hospital, where he died June 27, aged 63, of myocardial infarction.

Overton, Orrin V. ⊕ Janesville, Wis.; Rush Medical College, Chicago, 1923; member of the American Academy of General Practice and charter member of the Rock County Chapter; past-president and secretary of the Rock County Medical Society; member and past-president of the staff of the Mercy Hospital; died June 17, aged 58, of acute coronary thrombosis.

Pagelsen, Otto Hugo ⊕ Des Moines, Iowa; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, Chicago, 1898; died in the Iowa Methodist Hospital June 23, aged 86, of cardiovascular accident and fracture of the hip.

Pariseau, George Emory ⊕ Major, U. S. Army, retired, Bethesda, Md.; Tufts College Medical School, Boston, 1909; also a graduate in pharmacy; appointed a first lieutenant in the Medical Corps of the U. S. Army in March, 1911; served in France during World War I; at one time registrar at Fitzsimons Army Hospital in Denver; retired for disability in line of duty Dec. 15, 1922; died in the Walter Reed Army Hospital, Washington, D. C., July 29, aged 74, of hepatorenal failure, pyelonephritis, and acute granulocytic leukemia.

Parker, John Henry, Tampa, Fla., Vanderbilt University School of Medicine, Nashville, Tenn., 1916; died May 22, aged 82.

Parr, Holly Hicks, Eudora, Ark.; Atlanta (Ga.) College of Physicians and Surgeons, 1906; died June 29, aged 77.

Paul, Andrew Beno, New York City; Magyar Királyi Pázmány Petrus Tudományegyetem Orvosi Fakultasa, Budapest, Hungary, 1926; member of the Medical Society of the State of New York; on the staffs of the Manhattan Eye, Ear and Throat Hospital and the University Hospital; died June 19, aged 54, of coronary occlusion.

Payne, Guy, Canaan, N. Y.; Bellevue Hospital Medical College, New York City, 1898; member of the American Psychiatric Association; past-president of the New Jersey Psychiatric Association and the New Jersey Hospital Association; specialist certified by the American Board of Psychiatry and Neurology; veteran of World War I; retired in 1947 as medical director and superintendent of the Essex County Overbrook Hospital in Cedar Grove, N. J., with which he was associated for many years; died July 1, aged 78, of arteriosclerosis and cerebral hemorrhage.

Pelzer, Seymour George ⊕ Bristol, Tenn.; Universität Bern Medizinische Fakultät, Switzerland, 1936; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; a member of the board of directors of the Salvation Army, and parole officer; on the staff of the Bristol Memorial Hospital; member of the Chamber of Commerce; died July 27, aged 45, of acute coronary thrombosis.

Perrine, Cornelius C. ⊕ Fair Haven, N. J.; Jefferson Medical College of Philadelphia, 1932; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; served during World War II; on the staffs of the Riverview Hospital in Red Bank and the Monmouth Memorial Hospital in Long Branch; died June 22, aged 50, of coronary occlusion.

Peterson, Allan Richard ⊕ Daggett, Mich.; Northwestern University Medical School, Chicago, 1928; trustee of the village council; on the staffs of the St. Joseph-Lloyd Hospital in Menominee and the Marinette (Wis.) General Hospital; president-elect of the Menominee County Medical Society; treasurer of the board, Pine Crest State Sanatorium in Powers; died in Sault Sainte Marie, Ontario, Canada, June 24, aged 55, of coronary thrombosis.

Phelps, Eugene Talmage ⊕ Hebron, Neb.; Rush Medical College, Chicago, 1912; member of the American Diabetes Association, American Academy of General Practice, and the Illinois State Medical Society; for many years practiced in Chicago, where he was on the staff of the Woodlawn Hospital; died in the Bishop Clarkson Memorial Hospital, Omaha, June 15, aged 71, of hemorrhage from esophageal varices.

Pierce, Paul Leon ⊕ Denison, Texas; Baylor University College of Medicine, Dallas, 1921; member of the American Academy of General Practice; on the staff of Madonna Hospital; died June 3, aged 59, of suffocation during a fire in his home.

Pilkinton, Lloyd, Nashville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1917; medical examiner for insurance companies; died July 1, aged 63, of a heart attack.

Polkinhorn, Henry Alexander ⊕ Washington, D. C.; Medico-Chirurgical College of Philadelphia, 1896; died July 25, aged 82.

Pope, Henry Cook, Richmond, Ky.; Hospital College of Medicine, Louisville, 1906; member of the Kentucky State Medical Association; vice-president of the Henry Cook Pope Hospital, where he died June 22, aged 75, of coronary thrombosis.

Porter, Charles Edwin ⊕ Redfield, Iowa; Drake University College of Medicine, Des Moines, 1908; member of the city health department; died June 18, aged 78, of myocardial failure.

Poska, Abraham ⊕ Seattle; Rush Medical College, Chicago, 1899; died in Los Angeles June 17, aged 78, of arteriosclerosis.

Price, John Leo, St. Louis; St. Louis University School of Medicine, 1910; died June 12, aged 71.

Rahhal, George Metray ⊕ Atoka, Okla.; University of Oklahoma School of Medicine, Oklahoma City, 1945; interned at the Wichita-St. Joseph Hospital in Wichita, Kan., and the City-County Hospital in Fort Worth, Texas; entered the Medical Corps, Army of the United States, in April, 1946, and separated as a captain in April, 1948; served as physician at the State Penitentiary in McAlester; on the staff of the Mary Hurley Hospital in Coalgate; died June 27, aged 39, of internal hemorrhage.

Ray, Robert Hensley ⊕ West Memphis, Ark. (licensed in Arkansas in 1903); also an ordained minister; served two terms in the state legislature; formerly secretary of the Crittenden County Medical Society; one of the original members of the staff of Crittenden Memorial Hospital; died July 4, aged 77, when his automobile was struck by a train.

Rice, Alexander Hamilton, New York City; Harvard Medical School, Boston, 1904; formerly professor of geographical exploration at his alma mater; died in Newport, R. I., July 23, aged 80, of uremia and arteriosclerosis.

Roberts, William Job, Clinton, La.; Memphis (Tenn.) Hospital Medical College, 1900; past-president and secretary of the East Feliciana Parish Medical Society; veteran of World War I; at one time medical officer with the Veterans Administration in Denver; served as a Presbyterian minister; died May 26, aged 87, of coronary occlusion.

Sanders, Guy Cecil ⊕ Richards, Texas; Medical Department of Tulane University of Louisiana, New Orleans, 1912; past-president of the Grimes County Medical Society; for many years president of the local school board; died May 2, aged 70, of pneumonia and brucellosis.

Scharpenberg, Louis George ⊕ Sedro Woolley, Wash.; Northwestern University Medical School, Chicago, 1939; interned at the King County Hospital in Seattle; died July 10, aged 45, of cerebral hemorrhage.

Smith, Edwin Merle, Grand Rapids, Mich.; University of Michigan Medical School, Ann Arbor, 1925; member of the American Academy of General Practice, on the staff of the Blodgett Memorial Hospital, where he died Aug. 3, aged 60, of multiple myeloma.

Smith, Fletcher Adrian, Elberton, Ga.; Emory University (Ga.) School of Medicine, 1928; died July 14, aged 56, of cancer of the sigmoid colon.

Sperl, Joseph Tours, Gary, Ind.; Rush Medical College, Chicago, 1923; died May 18, aged 70.

Swenson, Samuel August, Omaha; University of Nebraska College of Medicine, Omaha, 1910; member of the American Academy of General Practice; an associate member of the American Medical Association; on the staffs of the Immanuel, Nebraska Methodist, and Children's Memorial hospitals; died July 31, aged 77, of carcinoma of the liver.

Sylvester, George Elwin, Black River, N. Y.; Bellevue Hospital Medical College, New York City, 1889; an associate member of the American Medical Association; past-president of the Jefferson County Medical Society; served as president of the board of education, as village health officer, and health officer of Rutland for years; on the staffs of the Mercy Hospital and House of the Good Samaritan in Watertown; died June 30, aged 91, of hypertensive heart disease.

Teller, William H., Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1886; an associate member of the American Medical Association; chief surgeon emeritus at the old Jewish Hospital, now a part of the Albert Einstein Medical Center; died July 14, aged 89.

Thompson, Elmer Gibson, Chicago; Chicago College of Medicine and Surgery, Chicago, 1910; died in St. Mary of Nazareth Hospital Aug. 5, aged 69, of cerebral metastasis from carcinoma of the left lung.

Timblin, William Stanley ⊕ Rockford, Ill.; Rush Medical College, Chicago, 1913; specialist certified by the American Board of Internal Medicine; associated with the Swedish-American Hospital, where he was president of the medical staff, 1954-1955, for four years member of the executive committee, and chairman of the medical section for the last two years, and where he died Aug. 9, aged 67, of rupture of the myocardium and myocardial infarction.

Vaughan, George Edward, Southside, Tenn.; Vanderbilt University School of Medicine, Nashville, 1898; an associate member of the American Medical Association; member of the Kentucky State Medical Association; formerly practiced in Louisville, Ky., where he was on the faculty of the University of Louisville School of Medicine, and on the staffs of the Norton Memorial Infirmary and the Louisville General Hospital; died June 1, aged 79, of cerebral hemorrhage.

Vergosen, Harry Edward, Jr., Detroit; Detroit College of Medicine and Surgery, Detroit, 1933; interned at the City of Detroit Receiving Hospital; formerly a resident at the Herman Kiefer Hospital; veteran of World War II; on the staffs of the Florence Crittenton, East Side General, and Mount Carmel Mercy hospitals; died June 20, aged 52, of acute myocardial infarction and diabetes mellitus.

Vermilya, Joseph Clyde, Brownstown, Ind.; Medical College of Ohio, Cincinnati, 1896; died June 17, aged 84, of coronary thrombosis, valvular heart disease and arteriosclerosis.

Ward, Cassius A., Jacksonville, Fla.; Leonard Medical School, Raleigh, N. C., 1907; died June 22, aged 81, of arteriosclerotic heart disease and diabetes mellitus.

Way, Clarence Wilton ⊕ Sea Isle City, N. J.; University of Pennsylvania School of Medicine, Philadelphia, 1909; veteran of World Wars I and II; formerly secretary of the Cape May County Medical Society; served as editor of the *Journal of the Medical Society of Cape May, N. J.*; died July 31, aged 73.

Weitzner, Herbert A. ⊕ Berkeley, Calif.; Rush Medical College, Chicago, 1938; interned at the Beth-El Hospital in Brooklyn, N. Y.; formerly a resident at the Triboro Hospital of Queens Hospital Center in Jamaica, N. Y., and the Veterans Administration Hospital in Batavia, N. Y.; on the staff of the Kaiser Foundation Hospital in Oakland, where he died June 19, aged 44, of coronary thrombosis.

Whitty, Charles Aloysius ⊕ Norwichtown, Conn.; Queen's University Faculty of Medicine, Kingston, Ontario, Canada, 1929; member of the American Trudeau Society; fellow of the American College of Surgeons; served as a resident surgeon at the Cedarcrest Sanatorium in Hartford; died in the Grace-New Haven Community Hospital, New Haven, June 18, aged 52, of tuberculosis following a right pneumonectomy.

Wood, Mary Anna, Pittsfield, Mass.; Tufts College Medical School, Boston, 1898; died in the Pittsfield General Hospital April 11, aged 91, of arteriosclerosis.

Wrather, James R., Amarillo, Texas; University of Louisville (Ky.) Medical Department, 1886; member of the State Medical Association of Texas; past-president of the Potter County Medical Society; died in St. Anthony's Hospital July 13, aged 81, of arteriosclerosis and cardiac asthma.

FOREIGN LETTERS

FINLAND

Congenital Dislocation of the Hip and Breech Presentation.—At two children's hospitals in Helsinki a study of the cause of congenital dislocation of the hip was undertaken by Nystrom and Zilliacus, whose findings are published in *Nordisk medicin* for July 12. Their series of 124 patients with this condition consisted of 96 girls and 28 boys. In 85 the disease was unilateral (on the left side in 53 and on the right in 32). In 16% there was a history of breech presentation, and it would seem that the chance of a breech presentation being associated with congenital dislocation of the hip is so great that the latter should be looked for whenever the former has occurred. Most of the available evidence on the subject suggests that the congenital dislocation promotes the breech presentation and not the reverse. The mean weight at birth of the babies born with breech presentation in this series was only 3,216 gm., whereas it was 3,575 gm. for all those with congenital dislocations. Having observed 10 patients in whose families congenital dislocation of the hip had occurred in more than one member, the authors are inclined to include this condition among the hereditary diseases. The immediate cause of the breech presentation in cases of congenital dislocation may be that it prevents the fetus from using its legs for turning away from a breech presentation.

Orchitis Due to Mumps.—In *Nordisk medicin* for Aug. 9 Klemola and Somer report a series of 105 patients with orchitis due to mumps. Corticotropin was given intramuscularly to 41 patients, cortisone to 11, and a placebo to 53. No statistically significant difference could be found with regard to the duration of the fever and other symptoms, and in each of the three groups there were patients showing a remarkably prompt response to the injections. These findings are in contrast to the more positive findings published by Solem in *Acta medica scandinavica* in 1954, and it is admitted that in the present series the doses of corticotropin (40 I. U. on the first day, 20 on the second and again on the third, and 10 on the fourth) may have been too small.

INDIA

Cardiospasm.—Gopinath and co-workers (*Journal of the Indian Medical Association*, Aug. 1, 1956) state that cardiospasm is observed in 18% of all patients with esophageal lesions. The authors' series comprised 22 patients ranging from 10 to 60 years of age. The duration of symptoms ranged from 11 months to over three years. Dysphagia, pain, vomiting, and loss of weight were the commonest symptoms. The operations that were performed on different patients included dilatation, modified Heller, classic Heller, Heyrovsky, and Heyrovsky combined with gastrojejunostomy. The authors prefer Heller's operation, using the thoracic route. The advantages include short operative time, uneventful postoperative period, short hospital stay, and dramatic functional improvement. This is the only simple procedure that is effective and not complicated by reflux esophagitis. The clinical results of both dilatation and Heller's myotomy may far exceed the improvement noted objectively by having the patient swallow barium. This suggests that a narrow segment of the esophagus is the focus to be treated and that the dilatation is a secondary effect.

Urinary Diastase.—Anand and Sawhney (*Indian Journal of Surgery*, June, 1956) assessed the significance of the test for urinary diastase in the diagnosis of acute pancreatitis. They studied 112 normal healthy subjects to find the range of normal variations and 78 patients with acute upper abdominal pain, including 43 with acute cholecystitis. Repeated estimations were carried out in 18 patients with acute pancreatitis at short intervals to detect variations in the pattern of curves of urinary diastase during the course of the disease. Determinations of serum amylase were also made in all these subjects to discover the relationship, if any, between the levels of serum and urinary amylase. Wide variations in urinary diastase levels in healthy persons and in patients with upper abdominal pain were noted. They concluded that levels of 60 units or more per 100 cc. should be considered abnormal but not diagnostic of pancreatitis. The levels may differ at different times in the same subject, according to the concentration of the urine. This factor makes the test unreliable in the diagnosis of acute pancreatitis. Simultaneous estimations of serum amylase and urinary diastase should be made to arrive at a definite diagnosis.

Serum Amylase.—Anand and Sawhney made further study of the serum amylase test (*Indian Journal of Surgery*, June, 1956). In 100 normal, healthy subjects, 87 had values ranging between 80 and 200 Somogyi units per 100 cc. The rest had levels of over 200 units. In addition to these, 87 patients with upper abdominal pain, including 41 with acute cholecystitis, were studied, and serial estimations of serum amylase levels were made at short intervals on 25 patients with acute, relapsing pancreatitis. Repeated estimations were also made on six patients with pseudopancreatic cysts. Serum amylase levels remain within normal limits in most of the upper abdominal emergencies uncomplicated by pancreatitis. Any rise above 320 units per 100 cc., especially if the estimations are made at the height of the pain and if the level drops after the attack subsides, is suggestive of pancreatitis. Repeated estimations at frequent intervals are necessary to detect a slow or delayed rise in some patients with pancreatitis. It is also possible to have episodes of pancreatitis unassociated with any rise in serum amylase level. The readings should, therefore, be obtained in all attacks. In most patients the degree of rise in level of serum amylase varies with the severity of the disease, and the subsequent fall parallels subsidence of the attack. Once pseudopancreatic cysts have formed, the level of serum amylase remains elevated till the cyst is drained, even if there are no superimposed attacks of pancreatitis. This test is therefore of great help in confirming suspected diagnoses. In patients with chronic cysts in whom there is marked fibrosis of the cyst wall or in whom the communication of the cyst with the pancreatic duct closes, the absorption of serum amylase into the general circulation diminishes and the level falls.

Milk Powder for School Children.—Lal and Bose (*Journal of the Indian Medical Association*, Aug. 16, 1956) compared the nutritional results in a group of 337 schoolboys to whom skimmed milk powder from the United Nations International Children's Emergency Fund was distributed and a group of 359 boys who were getting no milk. The powder contained (in grams per 100 ml.) 35.35 of protein, 0.74 of fat, 49 of lactose, 0.14 of calcium, and 7.98 of mineral. The period of observation was 12 months. The group getting the milk showed a better increase in both height and weight, and the incidence of nutri-

The items in these letters are contributed by regular correspondents in the various foreign countries.

tional defects was lowered. It was observed that, with the existing diet, even 1 oz. of skimmed milk powder a day would further increase the height of the boys by 0.4 in. (1.02 cm.) and weight by 0.63 lb. (0.29 kg.) in a year.

ISRAEL

Cardiovascular Laboratory.—The cardiovascular laboratory of the Hadassah University Hospital was the first in Israel to use such procedures as cardiac catheterization, ballistocardiography, angiocardiography, and aortography. It also introduced such pulmonary function tests as determinations of maximum breathing capacity, residual air, and intrapulmonary mixing efficiency and the determination of respiratory gases in blood and expired air. The hemodynamics of patients with mitral stenosis were studied before they underwent valvulotomy in the department of chest surgery. The nature of pulmonary hypertension, prominent in certain patients with mitral stenosis, was investigated, and it was observed that increased pulmonary vascular resistance diminishes after administration of tolazoline hydrochloride, without a concomitant fall in cardiac output. The conclusion was drawn that pulmonary hypertension in mitral stenosis may be partly reversible by administration of a sympathicolytic drug. These studies are being extended, and the effect of tolazoline on the cardiac output and central blood volume, as determined by the Hamilton-Stewart method, is now under investigation. Although the most reliable method for the diagnosis of mitral stenosis or mitral insufficiency seems to be direct catheterization of the left side of the heart, the esophageal piezocardiogram has been found very useful in the determination of those conditions. Shortening of the C-V interval in the indirect atrial pulse pressure record was found to be characteristic of mitral insufficiency. The tracings recorded by this method resembled those obtained by direct puncture of the left atrium at the time of operation. Ballistocardiography has been applied extensively for the study of acute hemodynamic changes after the administration of drugs.

The effect of Foliandrin, a cardiac glycoside obtained from the oleander bush, was observed in experiments on healthy persons and on patients with heart failure. Ballistocardiograms of patients with heart failure showed a marked improvement, which appeared a few hours after administration of the drug, while in normal persons the pattern deteriorated. These effects were similar to those observed after the administration of rapidly acting digitalis glycosides. The effects of chlorpromazine on the ballistocardiogram, blood pressure reading, and electrocardiogram were studied in a series of normal persons, and it was observed that, after the intramuscular administration of the usual amounts of this drug, blood pressure decreased, the electrocardiogram became abnormal, and the ballistocardiographic pattern deteriorated. It appears, therefore, that administration of this drug to patients with organic heart disease may be harmful.

Filariasis.—M. Yoeli reported (*Harefuah* 61:56, 1956) on a survey of filariasis among Indian-Jewish immigrants that was carried out in the period June, 1955, to May, 1956. Examination of blood taken at night from 878 immigrants revealed 102 to be carriers of Wuchereria bancrofti. Microfilaria carriers were found in all age groups. The density of the microfilariae in the peripheral blood of the carriers varied greatly. Most carriers were symptom-free and did not show any clinical manifestations of their infection. The settlers examined were part of a group of 2,155 Indian Jews, most of whom settled in Israel after 1953. Ethnically they belong to the racially distinct descendants of ancient Jewish communities in the Travancore-Cochin region of India. In a detailed study carried out in 1953 in the Jewish communities of Malabar, all the manifestations of endemic filariasis were found. Of 1,904 persons examined, 13.5% showed clinical signs of overt filariasis. In Israel the Indian Jews are grouped in ethnically homogeneous villages in the hilly part of the country and in the dry Negeb in the south, but many have settled and have been absorbed in the modern and well-established settlements of the country. A study of conditions existing in these homogeneous villages revealed factors in the habits and habitat of the Indian-Jewish settlers favoring transmission of filariasis (overcrowding, high temperature, and high humidity in the houses and personal habits that may facilitate infection of local mosquitoes and permit development of infective larvas of W. bancrofti).

A small number of Culex modestus were found infected with W. bancrofti (all stages) in dwellings of carriers in a hill village in the Jerusalem area. Nocturnal blood examination of 619 European members of two settlements, among whom Cochin-Jewish immigrants have been living for the past two to five years, showed no infection with W. bancrofti, in spite of heavy Culex infestation and the existence of carriers among the new immigrants. Chances of filarial transmission under conditions prevailing in modern settlements in Israel are small, but there may be some local infections in the settlement of Indian Jews who preserved the old ways of life and where antimosquito measures and specific antifilarial treatment is not carried out. A systematic campaign for treatment with diethylcarbamazine citrate has been initiated under strict supervision by the Israel Ministry of Health. Examination of blood of groups of 15 W. bancrofti carriers after a two-week course of treatment (2 mg. of diethylcarbamazine per kilogram of body weight, three times daily) showed a total suppression of microfilariae from the peripheral blood for a period of 15 weeks and a partial suppression to subinfective levels for a period of five months. It may, therefore, be presumed that, through the combined action of systematic and repeated diethylcarbamazine therapy and antimosquito measures, filariasis will not spread in Israel and the existing foci will be eliminated in time.

ITALY

Geriatricians Meet.—The meeting of the Italian Society of Gerontology and Geriatrics was held in June in Montecatini-Terme. Professor Sotgiu classified old persons as those who have no digestive disturbances and who, without getting fat, eat large quantities of food; those who because of lack of appetite eat little; and those who have subclinical or functional disturbances and do not consult a physician. Digestive disorders in old persons are often caused, at least in the beginning, by a loss of teeth that have not been replaced. Professor Patrassi described the histopathological changes that occur in the liver of old persons. The most frequent changes are due to sclerosis. On the basis of these alterations, functional inadequacy develops slowly and is manifested especially in protein metabolism, with a diminution in serum albumin and an increase in gamma globulin.

SWITZERLAND

Bacterial Allergy and Vasculitis.—Bacterial allergy seems to be an important factor in the pathogenesis of many diseases, notably glomerulonephritis and acute rheumatic fever, in which there is an allergy to group A hemolytic streptococci. Certain episodes in patients with tuberculosis can also be explained by an allergy to the Mycobacterium tuberculosis. P. Miescher (*Schweiz med. Wchnschr.* 86:799, 1956) studied several patients with Schönlein-Henoch syndrome, migrating phlebitis, and related conditions and showed that a local common infection, not serious in itself, initiated such serious complications as purpura, digestive or urinary hemorrhages, arthralgia, phlebitis, or subcutaneous nodules as in rickets. The author believes that these different manifestations represent a hyperergic tissular response to bacteria or their toxins. He bases this belief on (1) positive skin reactions to bacterial filtrates; (2) the histology of the purpuric eruptions and nodules, which are characterized by an infiltration of polynuclear leukocytes around capillaries, venules, and arterioles; (3) the close similarity of the histology of the area positive to skin test when bacterial filtrates of streptococci, micrococci, enterococci, and Escherichia coli were used to that of the primary purpuric lesion, (4) absence of bacteria in the blood and in the tissular lesions; (5) the ability of an injection of the bacterial vaccine (the antigen) and of any operation on the infectious area to initiate an attack; (6) the disappearance of symptoms after the elimination of the infection; (7) the appearance of symptoms within an interval after a relapse of the primary local infection; and (8) improvement following desensitization.

Hypophysectomy for Cancer of the Breast.—Luft and Olivecrona (*Schweiz med. Wchnschr.* 86:113, 1956) describe their results with hypophysectomy in a series of 50 patients with cancer of the breast with metastases. There were three postoperative deaths: one from pulmonary embolism, one from aspiration pneumonia, and one from thyrotoxicosis. Three other patients died of intercurrent affections; 26 were not improved and did not live long. For several, hypophysectomy was shown not to be total. The question of relation between the radical nature of the operation and the therapeutic success was not determined. In addition, the tests usually showed a total loss of hypophyseal function. Twenty patients showed subjective and objective improvement, the objective criteria being the diminution or the disappearance of the tumor or of its cutaneous and lymphatic metastases and the diminution or arrest of osseous and pulmonary metastases for at least six months. The general state of the patients was better and their pains greatly reduced. The period of quiescence lasted one or two years, after which death came quickly. Eleven patients were still living one to three and one-half years after the operation. The authors also performed hypophysectomies in some patients with diabetes and the Kimmelsteil-Wilson syndrome. This operation is justified by its effect on experimental diabetes and by the fact that two hormones of the hypophysis are diabetogenic. In the last four years this operation was performed on 20 patients with severe malignant disease. There were three postoperative deaths and four deaths within several months, two of which were due to the attempt to use desoxycorticosterone as a substitute for cortisone. Transitory epileptic crises constitute a complication that was not found in patients operated on who also had cancer of the breast. In the survivors the dosage of insulin could be reduced. The systolic and diastolic pressures were lowered a little over a period of one year. There was a diminution in the size of the heart. Renal function and retinopathy remained stationary, but in some patients there was an improvement in the appearance of the eyegrounds.

UNITED KINGDOM

Report of Cancer Campaign.—Men who drink beer daily tend to run an increased risk of cancer, according to Dr. Percy Stocks (33rd annual report of the British Empire Cancer Campaign). Dr. Stocks reached this conclusion after studying the dietary habits of 2,770 hospital patients. Among men, frequent beer-drinking is positively associated with cancer of the esophagus, intestine, lungs, and other organs, but not with gastric cancer. In contrast, daily milk-drinking was associated with a decreased incidence, especially of lung cancer. The Duke of Gloucester, president of the campaign, said that the campaign's income for 1955 totaled $1,400,000. It might be thought that the campaign was well off, but in fact it had no more than one year's reserve funds.

Dentist Criticizes Health Service.—In his presidential address to the annual conference of the British Dental Association, Mr. R. J. Hooker said that the experience of dentists working in the National Health Service had proved that there is an emphasis on the second rate. All dentists are paid on the same scale, and the man who conducts his practice in the cheapest possible manner with the barest minimum of equipment does the best financially. There is no allowance for skill, experience, or amenities provided for patients. Mr. Hooker agreed that there had been a great increase in the amount of prophylactic work done for young people and that dentistry had been made available to many more people, but it is unfortunate that the service is under political control

Shortage of Nurses.—Lack of nurses will cause the hospital service as now known to collapse soon, said Dr. J. F. Galloway, Wolverhampton Medical Officer of Health, at the British Medical Association's annual meeting. There are now 104 women to every 100 men in the age group 18-29. In 1966 the proportion will be 97 women to every 100 men. By that time nearly all women of that age will be either expectant or nursing mothers. It would then be impossible to recruit nurses on the same scale as today. For home nursing, people would have to rely on women who had finished with their family responsibilities. These women would have a month or six weeks of training and would be assigned to a definite area.

Cancer Scares.—Mr. A. Dickson Wright, a leading London surgeon, speaking at the meeting of the British Medical Association said that everything we do, whether it be smoking or drinking beer, has some danger of cancer attached to it. The Chinese opium smoker and the Malayan betel-nut chewer have their special liabilities. The motorist is exposed to carcinogenic fumes Even such a harmless entertainment as sunbathing has its quota of cancer risk. Since prophylaxis can cut us off from all our amusements, it is best to enjoy life and take the small risks attached to these things.

Standard Titles for Serologic Products.—The *British Medical Journal* of July 7 contains an article by Perry and Parish wherein they make a plea for an international standardization of titles for serologic products. They propose using abbreviations comprising a shortened version of the name of the disease or organism associated with the material administered and a shortened version of the name of the type of product concerned. In some cases a third part may have to be added in order to identify a particular variety of the type of product. The first general principle is that, if only one disease or organism is mentioned, three letters (usually the first three) are used. Wherever possible the Latinized title is abbreviated. Should confusion appear likely as a result of this general method of abbreviation, the full name is used, e. g., Cho for cholera but no abbreviation for typhoid or typhus. The second general principle is that, where more than one disease appears in the title, capital letters only are used as abbreviations for the names of the diseases and organisms, e g, TAB for typhoid, paratyphoid A, and paratyphoid B, and DTP for diphtheria, tetanus, and pertussis. The abbreviation of the name of the disease or organism is followed by a diagonal line, after which appears the abbreviation for the type of product The scheme envisages the use of prophylactics for which the general abbreviation Vac is suggested (Tet/Vac for tetanus toxoid) and therapeutic antiserums for which the general abbreviation Ser is suggested (Tet/Ser for tetanus antitoxin). In a few cases the abbreviation Vac will be replaced by Tox, where both a vaccine and a toxoid are commonly available (Sta/Tox for staphylococcus toxoid). If there are a number of distinct varieties of one type of product and it is desirable to distinguish between them, the two-part abbreviation just described is followed by another diagonal line, after which is written an approved abbreviation for the particular variety of product concerned, e. g., Dip/Vac/APT for diphtheria prophylactic alum-precipitated toxoid. This should not be a frequent problem.

CORRESPONDENCE

UNKNOWN CHILD

To the Editor:—The police department of the city of New York is endeavoring to identify an unknown white female found in the basement of Beth El Hospital, Brooklyn, N. Y., on July 31, 1956, and removed to Bellevue Hospital for treatment. The subject's medical description, according to Dr. Ferdiman at Bellevue Hospital, is as follows: She makes symbolic gestures with hands and makes many rocking movements, keeping legs in a semifetal position. There is marked wasting of muscles in the legs. She has 24 teeth; bifid uvula; and hypertension at all joints, with no marked neurological deficit or obvious nutritional deficiencies. Height measures 41 in. (104.1 cm.); head measures 18.1 in. (46 cm.); chest measures 21.9 in. (55.5 cm.); weight is 28.25 lb. (12.8 kg.); and x-rays of her teeth reveal a dental age of 8 to 9 years. X-ray pictures of bones reveal age of 8 to 9 years. She is thought to have microcephaly, with mental retardation and regressing autism. She has cleft palate and pilonidal sinus, which may or may not have been present at birth. Since the readers of THE JOURNAL are doctors, it is possible that one of them may have delivered, treated, or examined the subject at one time and can assist in her identification.

POSTHERPETIC NEURALGIA

To the Editor:—I have recently reviewed an article in THE JOURNAL (161:511 [June 9] 1956) on postherpetic neuralgia. In this article and other articles are listed the various medicines and surgical procedures to use. However, a very important and highly effective agent was not even discussed, and I have seen practically no mention of the same in any journal. I refer to the use of ganglionic blocking agents, particularly to those that produce a parasympatholytic effect. I would also like to refer readers who are interested to an article published in *Northwest Medicine* (50:432 [June] 1951), by myself, Reekie, and Sinclair. It was found in this particular series that the ganglionic blocking agent methantheline (Banthine) bromide was most effective. My unpublished data on a series of 15 patients revealed the efficacy of any of the true parasympatholytic agents in herpes zoster or postherpetic neuralgia. One may give the drug in tablet form or by injection. The proper contraindications should be observed and the side-effects discussed with the patient, but any patient who has the severe pain of herpes will not object to a few side-effects if his pain is relieved, and it will be in about 90% or more of the cases if the proper dosage is used. It is possible, and I have seen it happen, that 75% of the pain will be relieved in a matter of 30 to 60 minutes, even though the pain may have been present for days or weeks. In some cases, complete abolition of pain can occur within 24 hours.

It is my impression that herpes zoster and the resultant neuralgia are similar in character to reflex sympathetic dystrophy. I feel also that it is a dysfunction of the autonomic nerve system rather than a true bacterial or viral disease. It is possible that a virus or other agent could be a precipitating cause, but it is more probable that it is not and is purely a reflex change. This also leads one to speculate on other skin lesions that are characteristic. Has anyone ever given ganglionic blocking agents to patients with measles, chickenpox, smallpox, hives, or any illness with skin lesions in the so-called viral or allergic category, to see what will happen? It is time that a fresh approach to many illnesses be stimulated. It is conceivable to me that it would be possible to alter the skin lesions and even the course of the illness, such as in measles, chickenpox and others.

Paulsen Medical Building
Spokane, Wash.

MUSEUM OF HISTORY AND TECHNOLOGY

To the Editor:—The Congress of the United States has recently authorized the construction on the Mall in Washington of a museum to be called the Museum of History and Technology. The bill providing the funds for its construction was signed into law by President Eisenhower on June 13. The Museum of History and Technology, to be completed about 1960, will exhibit materials now housed in the Arts and Industries Building of the Smithsonian Institution. Among the many subjects included in the new museum will be medical history, dental history, and pharmaceutical history. Our preliminary plans for the Hall of Medical History call for exhibits on anesthesiology, cardiology, neurology, ophthalmology, pediatrics, roentgenology, and surgery, as well as exhibits on hospitals, nursing, and pioneers of American medicine. We wish to solicit the assistance of all members of the medical profession in finalizing our plans for the Hall of Medical History of the new Museum of History and Technology. While suggestions and assistance in planning the actual exhibits will be greatly appreciated, we are particularly anxious to obtain significant equipment for possible inclusion in the historical exhibits. Early x-ray machines, electrocardiographs, stethoscopes, sphygmomanometers, ether inhalers, and all types of surgical instruments are needed to complete our collections. We are also seeking complete fixtures and equipment to reproduce a pre-1900 physician's office, and a pre-1900 surgical operating room. Offers of such material should be sent directly to the undersigned. Due to limitations of space and to avoid duplication, actual material should not be sent until accepted.

and Public Health
Smithsonian Institution
Washington 25, D. C.

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

Myocardial Infarction Treated by Early Ambulation. P. Brummer, E. Linko and A. Kasanen. Am. Heart J. 52:269-272 (Aug.) 1956 [St. Louis].

Since the summer of 1952 shorter and less strict bed rest has been prescribed for patients with myocardial infarction admitted to the Medical Clinic of the University of Turku, Finland. The patients have been permitted to sit up in bed immediately after the state of shock has subsided. Bedside toilet privileges have also usually been allowed at an early stage. The patients have been allowed to begin ambulation two weeks after infarction, if no special contraindications are present. One week later they have been dismissed from the hospital. From about the middle of 1952 to the end of 1954 a total of 332 patients with myocardial infarction were treated. Seventy-four patients (22.4%) died during the period of bed rest, before ambulation was started.

Observations on the remaining 258 patients revealed that ambulation after a bed rest of two weeks involves no threat to the patient. The only two patients of this group who died during hospitalization had been in bed longer than two weeks. In a comparable series of 242 patients observed by Eckerström in Sweden, there were 17 deaths during the third week of bed rest in the hospital. The total mortality during the first six months from the beginning of ambulation is also fairly small with 22 deaths compared to 44 in Eckerström's series. Recurrence of infarctions was observed in 21 of the patients during the first month after discharge from the hospital, that is, from the fourth to the seventh week after the acute attack; six of the recurrent infarctions occurred during the first week. No suitable series was available for comparison of the incidence of recurrent infarctions, but the authors admit that the risk of recurrence may have increased to some degree after early dismissal from the hospital. Sudden increase of physical activity at home and discontinuation of anticoagulant therapy may be responsible for the increase in the recurrence of infarctions during the first month after dismissal. As regards other complications, their number was below rather than above normal in the series of patients treated by early ambulation.

Selection for Anticoagulant Therapy in Cardiac Infarction Using the Heparin Retarded Coagulation Time. A. A. F. Peel. Brit. Heart J. 18:378-384 (July) 1956 [London, England].

Rosenthal's "heparin-retarded coagulation-time" test, which measures the clotting sensitivity of the blood to added heparin, was performed in 149 patients with cardiac infarction. Those in whom clotting was accelerated were treated with anticoagulants (biscoumacetate [Tromexan] or phenylindanedione [Dindevan]), and those with a normal or prolonged clotting time did not receive any anticoagulants. The results were compared with those in an earlier series of patients in whom this method of selection and anticoagulant therapy were not used. In patients who had no history of previous cardiac disease, the author's method of selection met with considerable success. Anticoagulants were unnecessary in those whose heparin-retarded coagulation time remained normal; there were 28 such patients, and none of them died. In those with accelerated heparin-retarded coagulation time, anticoagulant therapy reduced the "expected" mortality rate of 54% to 18%. Recurrence or embolism within one year after the infarction was three times more frequent in those with a short heparin-retarded coagulation time than in those with a normal heparin-retarded coagulation time. The mortality rate was improved in patients of both sexes and of all ages; the improvement has been particularly striking in the older age group, which normally carries a much higher risk.

In patients with a history of previous cardiovascular disease the mortality remained high irrespective of the heparin-retarded coagulation time, and anticoagulants seemed incapable of reducing it. Nevertheless, the heparin-retarded coagulation-time test may serve as a guide with regard to the risks of extension of the infarct and of embolism, since death from these two causes occurred more frequently in patients in whom the heparin-retarded coagulation time was accelerated despite anticoagulant therapy. The heparin-retarded coagulation-time test was also performed in 126 patients with cardiac ischemia in an attempt to determine the need for prophylactic anticoagulant therapy; the incidence of infarction within six weeks of the onset of ischemia was reduced from 11% in an earlier series of patients in whom anticoagulants were not used to 8% in those with a short heparin-retarded coagulation time who received prophylactic treatment.

The Effect of Thyroid Disease on Calcium Metabolism in Man. S. M. Krane, G. L. Brownell, J. B. Stanbury and H. Corrigan. J. Clin. Invest. 35:874-887 (Aug.) 1956 [New York].

Abnormal thyroid function profoundly alters the calcium metabolism. The conventional balance techniques used in the study of calcium metabolism do not measure the processes of deposition and resorption of calcium. An indication of the skeletal turnover of calcium can be obtained from serial observations of the specific activity of radioactive calcium (Ca^{45}) in the blood and urine after intravenous injection. Ca^{45} was given intravenously to patients with hyperthyroidism and myxedema. Euthyroid subjects and patients with Paget's disease of bone and others with hypoparathyroidism were similarly studied. Several patients were studied before and after appropriate treatment. Total quantities of the isotope excreted and specific activities of the serum, urine, and feces were determined for from 9 to 22 days. In addition, stable calcium, phosphorus, and nitrogen balance tests were performed on each subject. In four subjects with hyperthyroidism, the specific activity of serum and urine declined more rapidly and to lower levels than in euthyroid controls. In contrast, two myxedematous patients demonstrated the least fall in specific activity. After five months of treatment of the myxedema, specific activity curves were found to decline at the same rate as in the control patients. Observation of all the specific activity curves suggests that they can be analyzed into a series of decreasing exponential functions. It is proposed that each function represents a discrete calcium compartment within the body. Changing thyroid function modifies the size of the calcium compartments and the rate of flow to and from these compartments. Compartment sizes and flow rates are greatest in hyperthyroidism and Paget's disease of bone and least in myxedema. Two of four hyperthyroid subjects were in nitrogen equilibrium, but in spite of this they showed marked losses of calcium in the urine and feces. The findings indicate that bone formation, as well as bone destruction, is proceeding at an increased rate in thyrotoxycosis.

Hashimoto's Struma Lymphomatosa: Diagnostic Value and Significance of Serum-Flocculation Reactions. R. W. Luxton and R. T. Cooke. Lancet 2:105-109 (July 21) 1956 [London, England].

Chronic lymphomatous thyroiditis (*Hashimoto's struma lymphomatosa*) is not uncommon, but its clinical picture is not always recognized and consequently there is disagreement about its incidence. Chronic lymphomatous thyroiditis should always be considered if a middle-aged woman has symptoms of hypothy-

The place of publication of the periodicals appears in brackets preceding each abstract.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individuals in continental United States or Canada who subscribe to its scientific periodicals. Requests for periodicals should be addressed "Library, American Medical Association." Periodical files cover 1947 to date only, and no photoduplication services are available. No charge is made to members, but the fee for others is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time, and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

roidism and a firm goiter Sometimes the patient is euthyroid, and occasionally the presenting syndrome may be indistinguishable from toxic diffuse goiter (Graves' disease). Accurate diagnosis is important In the past, surgical exploration was frequently resorted to because the firm goiter raised the question of malignancy, in which, however, hypothyroidism is rare Even in the absence of overt signs of hypothyroidism the discovery of an unusually firm thyroid gland should lead to laboratory investigation In chronic lymphomatous thyroiditis abnormal laboratory findings usually include a low normal or subnormal basal metabolic rate, a raised blood cholesterol level, a raised erythrocyte-sedimentation rate, and abnormal flocculation tests of liver function With this picture, diagnosis without recourse to operation should be possible

The correct treatment of chronic lymphomatous thyroiditis with hypothyroidism is the oral administration of dried thyroid in adequate dosage This treatment reduces the goiter and relieves the hypothyroid symptoms Serum flocculation tests of liver function are abnormal in the great majority of patients with chronic lymphomatous thyroiditis not treated with dried thyroid The thymolturbidity and colloidal gold tests were carried out in 24 patients with chronic lymphomatous thyroiditis and were found to be initially abnormal in 21 of them Treatment with dried thyroid caused a reversion to normal in the flocculation tests in 10 of the patients in from 4 to 26 months The colloidal gold test is more sensitive than the thymol turbidity test The bromsulphalein test was raised (up to 19% retention) in five of the nine patients examined

In 23 other patients with chronic lymphomatous thyroiditis treated with dried thyroid before serum flocculation tests were made, the tests were normal in 18 and became normal in 3 others within 29 months from the start of treatment There is evidence that in chronic lymphomatous thyroiditis the liver and spleen may become abnormal, in one patient advanced cirrhosis of the liver developed The abdomen should be carefully examined in patients who may have chronic lymphomatous thyroiditis, because a palpable spleen supports this diagnosis The fact that the serum flocculation reactions are positive in chronic lymphomatous thyroiditis has three important implications 1 The tests offer an additional means of diagnosis of a goiter without recourse to surgical exploration 2 The diseased thyroid may produce some abnormal secretion that damages the reticuloendothelial system 3 The reversion to normal of the flocculation tests, when treatment with dried thyroid is instituted, suggests a possible connection between thyroid activity and certain forms of hepatic cirrhosis

Treatment of Hepatic Coma or Precoma with Thioctic Acid. F Rausch Klin Wchnschr 34:737-742 (July 15) 1956 (In German) [Berlin, Germany]

A failure of the enzyme systems is to be expected in the severe hepatic insufficiency existing in hepatic coma Thioctic acid, one of the newest biocatalyzers, was used because it is capable of oxidizing pyroracemic acid and consequently can intervene in the intermediate metabolism This acid, which is a sulfur carbon compound, was found in liver extracts even before its chemical structure had been determined It is also found in organs other than the liver, and it is known to activate many enzyme systems The author describes the clinical histories of 12 patients in whom treatment with thioctic acid exerted a decisive influence on the hepatic coma The thioctic acid was injected intravenously in doses of 2.2 to 6.6 mg. In the first patient, Kussmaul's breathing had set in and the coma had persisted for 76 hours before 2.2 mg of thioctic acid was injected Six hours later, the patient awoke from his deep coma, Kussmaul's breathing stopped, and the fetor hepaticus disappeared

The coma subsided in all 12 patients Only one patient, who had been subjected to extirpation of the spleen because of hemolytic jaundice and whose liver showed no essential histological changes, died during a second attack of hepatic coma, after a first attack had responded to the injection of thioctic acid. The other five deaths were caused not by the hepatic coma but rather by circulatory insufficiency, bleeding from esophageal varices, or a malignant neoplasm. One of the patients who died survived her first attack of hepatic coma for 18 months, another survived for three months Six of the 12 patients are still alive and some of them are able to work. The author is convinced that thioctic acid is capable of interrupting hepatic coma, because no other substance was given when the coma stopped. He admits that in rare cases hepatic coma subsides without treatment, but he believes that the fact that successive attacks of coma in the same patients responded to the injection of thioctic acid, as well as other observations in the 12 patients treated, definitely proves that thioctic acid exerts a decisive effect The mode of action of the acid has not been explained Some investigators regard it as a hepatotropic and lipotropic and consequently hepatoprotective substance. The lipotropic effect suggests that thioctic acid might prove more effective in patients with fatty liver than either choline or methionine

Considerations on More than One Thousand Cases of Needle Biopsy of the Liver. G. Meneghini, F Orlandi and N Bendo Minerva med 47:1493-1494 (May 16) 1956 (In Italian) [Turin, Italy]

The authors report on seven years of experience with needle biopsy of the liver. The results were negative in only 79 of 1,179 patients Causes for failure were grouped under three headings technical errors, 37.9% of the cases, lack of cooperation from the patients, 20.2%, and local conditions, 41.7% Five severe complications occurred two hemorrhages, one bile peritonitis, one shock due to perforation of a hydatid cyst, and one sepsis. There were no fatalities Surgical treatment was necessary in three cases The authors combined their cases with others in the literature and found that, in 8,681 biopsies, severe complications occurred in 0.39% of the cases Fatal complications occurred in 0.08% of the cases, i. e., one fatality for 1,250 needle biopsies Experience is the only factor that can prevent severe complications.

The Blood Groups in Peptic Ulceration. D. A P. Brown, A. G. Melrose and J. Wallace Brit M. J. 2:135-138 (July 21) 1956 [London, England]

The distribution of the ABO blood groups among 2,059 patients with peptic ulcer was studied in two hospitals in Glasgow, Scotland. In 276 of these patients the maximum acid output of the stomach in relation to the ABO blood groups also was studied A control series was provided by 5,898 consecutive new registrations of blood donors at the regional blood transfusion center An increased frequency of group O was recorded in patients with duodenal ulcer, but the blood-group distribution in patients with gastric ulcer did not differ significantly from that of the controls, probably because the number of patients with gastric ulcer was too small. Among the patients with duodenal ulcer, those requiring surgical treatment made the greater contribution to the group O excess The frequency of group O was greatly increased in patients with marginal ulcers. No difference was observed in the frequency of rhesus-negative persons as compared with controls No correlation was noted between acid output and ABO group in patients with ulcers at either site. The results of a survey of peptic ulcer in one of the two hospitals in which the authors' studies were carried out enabled the authors to submit evidence suggesting that the patients in this investigation constitute a fairly representative sample of those attending or admitted to hospital in Glasgow.

Para-Aminobenzene-Sulfamido-Isopropyl-Thiodiazol in the Treatment of Diabetes Mellitus. A. Loubatières, C Fruteau de Laclos and P Bouyard Semaine hôp. Paris 32:2358-2368 (July 6) 1956 (In French) [Paris, France].

The authors report clinical observations on the action of N^1-[5-isopropyl-1, 3, 4-thiadiazol-2-yl] sulfanilamide (RP-2254). The physiological and pharmacodynamic properties of this substance are recalled, particularly its hypoglycemia-inducing action and its antidiabetic action An explanation of the clinical phenomena is suggested by an analysis of the respective behavior of diabetic animals and men in response to experiments. The effects of RP-2254 were studied for a period of over six months in 30 patients who were classified in three groups. those with satisfactory response to the treatment, those with no response, and those with partial response. The patients of the first group were obese, lipoplethoric diabetics. In these patients the pancreas contained a notable amount of insulin and the systemic blood contained a moderate amount of insulin. The patients of the second group had an insulin deficiency in both the pancreas and the systemic blood. Observations concerning these first two groups of patients seemed to confirm Loubatières' initial hypothesis that RP-2254, as an insulin-secreting substance, might cause the stored insulin of the pancreas to pass into the blood stream. The authors conclude that these hypoglycemia-inducing sulfanilamides may be given to diabetics over a prolonged period but that they should be used with great caution as long as specialists in diabetes have not yet definitely expressed their opinions on the subject.

Diagnostic Use of Adrenal Inhibition in Cushing's Syndrome. C. L. Cope. Brit. M. J. 2:193-197 (July 28) 1956 [London, England].

A five-day course of the orally administered halogen-substituted steroid 9 alpha-fluorohydrocortisone was given to three adult patients (one 46-year-old woman and two men aged 25 and 39 years respectively) and a 9-year-old boy with adrenal cortical hyperfunction (Cushing's syndrome) and to a 56-year-old man, a cardiac convalescent, who had no adrenal or other endocrine abnormality. Two of the three adult patients with adrenal cortical hyperfunction had so-called adrenal hyperplasia, and the third had mild and incomplete adrenal cortical hyperfunction of as yet undetermined causation. A large adrenal tumor was easily palpable in the left hypochondrium of the 9-year-old boy; when removed, it was found to be an anaplastic carcinoma of the adrenal cortex. Almost complete inhibition of the production of cortisol (hydrocortisone) was revealed by the disappearance of cortisone and hydrocortisone from the urine in the patient with normal adrenals and in the three adults with adrenal cortical hyperfunction. In sharp contrast to these findings, no trace of interruption occurred in the steadily increasing excretion of cortisone and hydrocortisone in the urine of the boy with carcinoma of the adrenal cortex. The results obtained in the five patients support the view, previously expressed by the author and by other workers, that adrenal cortical inhibition by 9 alpha-fluorohydrocortisone may be of diagnostic value in adrenal cortical hyperfunction as a means of distinguishing between that caused by adrenal hyperplasia and that caused by carcinoma.

Prolonged Chemotherapy in Chronic Pulmonary Tuberculosis with Combinations of Isoniazid, Paraaminosalicylic Acid, and Streptomycin. C. L. Joiner, K. S. Maclean, K. Marsh and others. Lancet 2:165-169 (July 28) 1956 [London, England].

In 1954, at the end of 24 weeks' therapy, the effect of treating chronic pulmonary tuberculosis with a combination of isoniazid and aminosalicylic acid (PAS) was compared by Joiner and associates with that of treating it with pairs of the three drugs, isoniazid, streptomycin, and aminsosalicylic acid, in rotation, each pair being administered for four weeks. The patients who had received the rotating treatment were considerably better both clinically and as regards sputum conversion. The patients have now been followed up for two years. The authors emphasize the fact that rotating therapy, when pairs of the three drugs, isoniazid (250 mg. daily), aminosalicylic acid (10 mg. daily), and streptomycin (1 gm. twice weekly), are given in rotation for four-week periods, is highly satisfactory in chronic pulmonary tuberculosis. Continuous treatment with isoniazid and aminosalicylic acid in similar dosage is significantly less efficient. Previous treatment with aminosalicylic acid, even if given in relatively small amounts and many years before, may explain the relative failure of the isoniazid-aminosalicylic acid regimen. Chemotherapy should be continued for at least a year and often longer if worthwhile results are to be achieved in the chronic fibrocaseous type of pulmonary tuberculosis.

Colour-Blindness in "Ovarian Agenesis": (Gonadal Dysplasia). P. E. Polani, M. H. Lessof and P. M. F. Bishop. Lancet 2:118-120 (July 21) 1956 [London, England].

In contrast with their feminine appearance, a large proportion of patients with so-called ovarian agenesis (gonadal dysplasia) do not have a female pattern of nuclear chromatin in skin cells and leukocytes, and in this respect they resemble males. This finding has both an application and an implication. The application is practical and is related to diagnosis after and especially before puberty. The implication is biological, because the inference is that the affected persons, though phenotypic females (with lack of secondary sexual characters after puberty), are genetic males. There are two ways in which further insight into the hypothesis of the genetic maleness of phenotypic females with ovarian agenesis could be gained: (1) by identifying the pair of sex chromosomes in dividing cells from tissue cultures of skin, bone marrow, or blood; and (2) by showing that individuals with ovarian agenesis and "male chromosomal sex" are carriers of genetically determined characters found more commonly in males.

The first method is not easy. As for the second method, sex-linked recessive conditions determined by genes carried on the nonhomologous segment of the X-chromosome, like hemophilia, could be used for this purpose but are too rare to be used statistically to demonstrate genetic maleness in a necessarily limited sample of cases of "ovarian agenesis." Since congenital red-green color blindness is sufficiently common to be detectable in a relatively small sample, the Ishihara test for color vision was made on 25 patients with ovarian agenesis. The finding of four color-blind subjects among them supports the hypothesis.

Obesity and Hypertrichosis. D. Z. Rocca. Semana med. 108:864-865 (June 14) 1956 (In Spanish) [Buenos Aires, Argentina].

Four hundred forty-three women with hypertrichosis, between the ages of 15 and 20 years, were observed in the Instituto Nacional de Endocrinologia of Buenos Aires. One hundred seventy-six of these were obese. In the group of obese patients, 124 had disorders of menstruation, 22 had a polycystic ovary, the elimination of the urinary 17-ketosteroids was increased in 20, and 16 had goiter. The author concludes that obesity and hypertrichosis are due to corticoadrenal disorders of hypophysial or hypothalamic origin. Often these conditions are combined with ovarian disorders and with goiter, showing a possible common causal factor. Corticoadrenal hyperfunction of hypophysial or hypothalamic origin stimulates on the one hand hypertrichosis and on the other lipogenesis, similar to that observed in Cushing's syndrome or in Achard-Thiers' syndrome, as the cause of obesity. A pure disorder of the metabolism of the calories with consequent increase in appetite is not the causal factor of obesity when this condition is combined with hypertrichosis.

SURGERY

Aneurysm of Thoracic Aorta in an Infant Treated by Resection and Arterial Homograft. D. A. Cooley and F. M. Taylor. J. Pediat. 49:185-190 (Aug.) 1956 [St. Louis].

Aneurysm of the aorta in infancy and childhood is rare, and successful surgical treatment has not been previously recorded. The authors report the case of an 11-month-old infant with a large fusiform aneurysm of the distal thoracic aorta that was either mycotic or congenital in origin. The aneurysm was resected and the aortic segment replaced by a lyophilized arterial homograft, with ultimate recovery of the patient.

Amnion Implantation in Peripheral Vascular Disease. E. Troensegaard-Hansen. Brit. M. J. 2:262-268 (Aug. 4) 1956 [London, England].

In an attempt to reduce intermittent claudication, human amnion was implanted into the thigh of 40 men between the ages of 35 and 89 years with peripheral vascular disease. Claudication was caused by arteriosclerosis in 38 patients and by Bürger's disease in 2. Symptoms had been present for more than six months in most of the patients, and conservative treatment had been practiced without significant effect in all of them. Three had been subjected to sympathectomy without effect on the claudication. The condition of the patients before and after the amnion implantation was assessed by their tolerance to exercise, the presence or absence of rest pain, the radioactive sodium test, oscillometry, radiography, and skin-temperature recordings. In 29 patients the claudication disappeared after the amnion implantation and could not be produced by severe exercise. In seven patients exercise tolerance was increased but mild claudication occurred during severe effort. One patient was a complete therapeutic failure. In three patients with early dry gangrene the condition of the extremity deteriorated after the amnion implant and high amputation was required. Evidence of tissue necrosis should, therefore, be regarded as a contraindication for amnion implantation. Preoperative and postoperative studies showed an increase in circulatory efficiency after the amnion implantation, as evidenced by increase in walking distance, exercise tolerance by ergometry, loss of rest pain, and increase in the dispersion rate of radioactive sodium from the calf. These favorable results depended on the use of intact amnion with a well-defined nucleated epithelial and stromal layer, whereas in 20 controls who received macerated amnion there was neither clinical improvement nor change in the results of objective tests.

Implants give rise locally to a vigorous outgrowth of capillaries and are absorbed in about three weeks. Clinical improvement begins in about three days and is maintained for a period that cannot yet be assessed. It has lasted for over three and a half years in two patients, over one year in seven, and in the remaining patients over eight months. There have been four relapses. It is suggested that the superficial circulatory changes after the amnion implantation, as evidenced by the feeling of warmth and rise of temperature in the extremity concerned, might also include the muscle vessels, so giving relief from claudication. The observation of relief from night pain is not inconsistent with this possibility. If an implant shows any signs of sepsis, generally no improvement is gained, either subjectively or objectively. However, very occasionally some subjective improvement has been observed in spite of sepsis. Some amnion has proved to be inactive, even after preparation by a standard technique, and at present no satisfactory explanation can be given for this observation. Reimplantation must always be carried out until claudication disappears. Reimplantation had to be performed four times in one patient before a satisfactory result was obtained.

A Clinico-Pathological Study of Thyroid Carcinoma. R. Alhadeff, F. Scott and S. Taylor. Brit. J. Surg. 43:617-626 (May) 1956 [Bristol, England].

Sixty-seven patients between the ages of 15 and 87 years with carcinoma of the thyroid were studied in an attempt to correlate the clinical and pathological findings. Nearly one-quarter of the patients were less than 40 years old. Up to the age of 40 years the same number of cancers occurred in both sexes, but in the patients over 40 years of age the ratio of women to men was 2.4 to 1. Microscopic examination of the tumors revealed that 31 patients had follicular tumors, 14 papillary tumors, 18 anaplastic tumors, 2 squamous tumors, one sclerosing tumor, and in one patient the tumor was unclassified. The three main histological groups had a distinctive age distribution; papillary carcinomas were more frequent in patients less than 30 years of age, the follicular types predominated in the patients between the ages of 30 and 40 years, while in patients in the fifth decade the three groups of tumors appeared with equal frequency. Twenty (30%) of the 67 patients had a preexisting goiter, i.e., a symptomless enlargement of the thyroid, for more than 10 years. Malignant change in a long-standing goiter was nearly three times more often follicular than anaplastic in type.

Regardless of the histological type, half of the carcinomas had already metastasized to regional lymph nodes by the time the patients were first seen. Follicular cancers metastasized twice as frequently to the skeleton, and the anaplastic cancers metastasized twice as frequently to the lungs. Papillary cancers were not observed to give rise to bone deposits. The disease was localized to the neck in patients less than 30 years of age. The absence of distant metastases in these patients favors a more radical surgical attack on thyroid carcinoma in young patients. Clinical evidence of hyperthyroidism was present in four patients. Iodine uptake was found most commonly in follicular carcinomas but was occasionally observed in other types. Microscopic examination revealed a definite pattern of metastasis depending on the histological type of the tumor. A correct preoperative diagnosis of thyroid carcinoma was made in 42 patients (63%): In the remaining 25 patients (37%) carcinoma was revealed only at operation or on pathological examination. The subsequent clinical course showed good correlation with the histological classification and grading of the tumors. Over one-third of the 19 patients with follicular grade 1 tumors died within six years from the time they first came under observation. Of the remainder, five have been followed for over 5 years. Of the 12 patients with follicular grade 2 cancers, 6 died within seven months of their first admission to hospital. Of those still alive, one has been followed for seven years. There was one death among the 11 patients with grade 1 papillary carcinoma and one death among the 3 patients with grade 2 papillary carcinoma. In the anaplastic group the large-cell carcinomas were the most malignant and rapidly growing of all thyroid tumors; the five patients with this type of tumor died within an average period of three months.

Management of Intraductal Papilloma: Its Relationship to Cancer of the Breast. M. A. Howard and M. S. Rosenblatt. Am. J. Surg. 92:142-150 (Aug.) 1956 [New York].

Seventy-six of 884 women who had a breast operation at the Good Samaritan Hospital in Portland, Ore., between 1949 and 1954, had intraductal papilloma (an incidence of 8.5%), and 83 of 1,773 women who had a breast operation at St. Vincent's Hospital in the same city, between 1940 and 1950, had intraductal papilloma (an incidence of 4.6%). The age of the 159 patients varied from 13 to 79 years. Eighty-five patients had a discharge from the nipples and 74 had not. The discharge was serosanguineous in 53, serous in 21, milky in 4, and watery in 7. Ten patients with intraductal papilloma also had concurrent carcinoma of the mammary gland, and the carcinoma was not related to the intraductal papilloma. Only one patient had an intracystic papilloma of the breast with early malignant change in situ. A second patient had an intraductal papilloma with sanguineous discharge and without penetration of the ducts, but the nuclear pattern was large and showed a predisposition to malignant change.

Intraductal papilloma accompanied by nipple discharge is a confusing and frequently a poorly managed problem. Carcinoma as well as benign breast disease can produce many different types of nipple discharge. The gravest danger is the possibility that nipple discharge may be produced by a deep-seated carcinoma of the papillary type or that intraductal papilloma may be associated with a carcinoma. There is a wide divergence of opinion in regard to the treatment of nipple discharge in intraductal papilloma. The methods used include observation without any treatment; semicircular or straight incision and removal of duct and intraductal papilloma; semicircular incision joined by straight incision; and simple mastectomy, particularly in postmenopausal patients. Of the 76 patients operated on at the Good Samaritan Hospital, 52 had segmental excision, and 28 had this operation at St. Vincent's hospital. Simple mastectomy was performed in only 9 patients at the Good Samaritan Hospital, but 38 patients had simple mastectomy at St. Vincent's hospital. Radical mastectomy was performed on 10 patients at the Good Samaritan Hospital and on 5 patients at St. Vincent's Hospital. The authors believe that carcinoma occurs so infrequently with intraductal papilloma that simple mastectomy is rarely indicated and radical mastectomy is never indicated unless a carcinoma is definitely diagnosed and proved by microscopic examination. They consider segmental resection of the involved portion of the breast with the offending duct to be the procedure of choice.

Cancer in the Second Breast. A. R. Kilgore, H. G. Bell and R. E. Ahlquist Jr. Am. J. Surg. 92:156-161 (Aug.) 1956 [New York].

Independent cancer developed in the second breast in 31 of 1,199 women with cancer in the first breast who had undergone radical mastectomy at the University of California and St. Joseph's Hospitals in San Francisco between 1918 and 1949. The cancers in the second breast were considered independent primary growths by general agreement with the following criteria: (1) definite evidence that the first radical mastectomy was performed for carcinoma; (2) lapse of time during which there is no sign of recurrent or metastatic disease; (3) development of a clinically independent second primary cancer in the opposite breast without any evidence of metastatic involvement elsewhere; and (4) compatibility of the clinical course of the patient after the second radical mastectomy with that of a primary lesion. With regard to the fourth criterion, it should be recognized that early recurrence or metastasis is not necessarily inconsistent with a new primary lesion. According to these criteria the incidence of independent cancer in the second breast was 2.6%; the 31 women were between the ages of 32 and 75 years. Nine of the 31 patients died of cancer and 3 died of intercurrent disease, while 19 are still living.

Many of the 1,199 patients whose first breasts were removed as late as 1949 are still living, and they are still exposed to the development of a new primary lesion, since carcinomas in the second breast may arise after intervals of as long as 10, 15, 20, or even more years. Five hundred sixteen of the 1,199 patients were in stage 1 at the time their first breasts were removed, and 162 of this selected group were operated on 15 or more years ago. In only 11 (6.8%) of these did cancer develop in the second breast. Although the total in this group is too small for accurate statistical evaluation, a substantial correction for future cases among patients still living is indicated. The eventual incidence will apparently rise to about 6%, roughly three times the general incidence of unilateral cancer. Thus a patient in stage 1 has a substantially greater chance of developing independent cancer in the remaining breast than the average woman has in either of her two breasts. Women vary in attitude toward loss of a remaining breast. Some have great reluctance to undergo another surgical intervention, even a minor one; others think it worthwhile to lose the second breast for whatever additional safety this may offer and for freedom from some anxiety about the possible appearance of a new cancer. An intelligent well-balanced woman is entitled to decide for herself on the basis of the most nearly accurate facts one can give her.

Vagotomy and Pyloroplasty in the Treatment of Duodenal Ulcer.

J. A. Weinberg, S. J. Stempien, H. J. Movius and A. E. Dagradi. Am. J. Surg. 92:202-207 (Aug.) 1956 [New York].

More than 500 patients with duodenal ulcer underwent vagotomy and pyloroplasty at the Veterans Administration hospital in Long Beach, Calif., during the past six years. There were two surgical deaths: one of these occurred on the sixth postoperative day and was caused by pulmonary embolism; the other occurred on the eighth postoperative day and was ascribed to uremia resulting from imbalance of electrolytes after a long preoperative period of pyloric obstruction. Two hundred patients were followed up postoperatively for from two to six years. Good results were obtained in 179 (89.5%). Poor results were obtained in 21 (10.5%): 10 (5%) of these were considered therapeutic failures because of definite or suspected evidence of recurrence, 8 (4%) had postoperative disabling sequelae, and 3 (1.5%) had manifestations of severe emotional stress.

The authors believe that vagotomy and pyloroplasty accomplish a cure more effectively than any of the other surgical procedures. Failure to heal the ulcer by vagotomy is almost invariably caused by incomplete interruption of the nerves. Complete vagotomy calls for good exposure and a familiarity with the pattern of the vagus nerves in the lower part of the mediastinum. Special emphasis is given to the technique of pyloroplasty. The commonly used technique of employing two or more rows of sutures to close the pyloroplasty wound causes an infolding of tissues that may interfere with satisfactory emptying of the stomach and thus defeat the purpose of the pyloroplasty. This difficulty is avoided by using a single row of sutures. There has been no evidence of leakage in the more than 500 pyloroplasties performed by the authors with the one-row suture technique. An important consideration in the successful use of pyloroplasty is the recognition of its contraindications. It is unsatisfactory for patients in whom the pyloroduodenal segment is constricted or distorted by inflammatory edema or excessive scarring. It is also unsuited for patients with a dilated and lowhanging stomach. Gastrojejunostomy or limited gastric resection should be used in these patients.

Vagotomy for Chronic Peptic Ulcer: A Five-Year Follow Up.

C. Slaney, P. G. Bevan and B. N. Brooke. Lancet 2:221-224 (Aug. 4) 1956 [London, England].

Ninety-one patients were operated on from 1947 to 1948 for chronic peptic ulceration. All patients have been followed up to the present time and the authors analyze the results after five years and assess the value of vagotomy in the treatment of chronic peptic ulceration. Eighty-three patients were male and eight female; their ages ranged from 19 to 68. Partial gastrectomy had been done previously in two cases and gastroenterostomy in three. Pain and vomiting were the chief symptoms in most cases; bleeding had taken place in 16 and perforation in 10, being coincidental in 2; the duration of symptoms varied from 4 months to 44 years. Seventy-nine patients had duodenal ulcer, five anastomotic ulcer, and one a gastric and a duodenal ulcer combined. Early in the investigation six patients with gastric ulcer were also included. All the ulcers were considered to be chronic. After the exclusion of four deaths not associated with ulcer, one operative death, and one patient lost to follow-up, it was found that recurrences developed in 24 patients (2 of whom died) out of the 85 remaining (28.2%), of whom 65 had had no drainage procedure at the time of vagal section nor any gastric operation before it. Recurrences developed in 18 of these 65 patients, giving a recurrence rate of 27.7% for vagotomy as the sole treatment of peptic ulcer. The frequency of recurrence appears to have been unaffected by the presence or absence of gastroenterostomy, pyloroplasty, or partial gastrectomy done either before or at the time of the vagotomy. The rate of recurrence will increase with the passage of time, for further recurrences have been observed since the five-year period. A notable feature was the development of gastric ulcer in six patients who had previously had duodenal ulcer. This might be explained by the mechanism that comes into play in concomitant gastric and duodenal ulcers, the gastric ulcer arising secondarily to stenosis and hold-up due to a duodenal ulcer; vagotomy would provide a good neuromuscular cause for disturbance of the normal pyloric outflow. Two difficulties have been encountered during the five-year period of assessment. The criteria of healing are entirely clinical because scarring may remain to present radiological evidence of duodenal deformity at all times. The various tests of gastric acidity are too variable in their results on different occasions in one individual to make comparison easy and are thus robbed of meaning; exact clinical correlation appears to be impossible.

Metastasizing Insulinoma with Hypoglycaemia.

R. C. Shaw. Brit. J. Surg. 43:579-585 (May) 1956 [Bristol, England].

A case of carcinoma of the islet cells of the pancreas invading the proximal lymph nodes and giving rise to spontaneous hyperinsulinism is described in a 49-year-old man. The patient had shown from boyhood an excessive liability of the adrenosympathetic system, with sweating, tachycardia, and peripheral vasoconstriction followed by faintness when he experienced psychic or somatic trauma. As he grew older this reaction to injury or unpleasant news became more prominent. The occurrence of these attacks of weakness or actual faintness became more pronounced in recent years and suggested the possibility of intermittent spontaneous hypoglycemia caused by excessive islet-cell activity over a long period, as indicated by the relief he obtained by taking sweet drinks. For several years the patient had had pain over the epigastrium and to the right of the umbilicus; this pain increased and was referred to the lumbodorsal region and also below the left costal margin. The urgency of surgical intervention was apparent from the severity of this pain combined with loss of weight, anorexia, and a major hypoglycemic attack that had occurred before his admission to the hospital.

On laparotomy, a hard craggy tumor was found in the tail of the pancreas; it involved the vessels in the hilum and the spleen. The whole of the tail of the pancreas, together with the spleen and the great omentum, was removed. Microscopic examination of the specimen revealed numerous small and large circumscribed tumor nodules replacing pancreatic tissue. The structure was acinar and trabecular. Large portions showed solid acini. Some tumor nodules were surrounded by dense fibrous tissue. The proximal lymph nodes were widely invaded. The patient survived the operation and was still in normal health two and a half years later. He resumed his work and experienced no further hypoglycemic attacks and was immune from psychological reaction on reference to or encounter with unpleasant subjects, particularly injury or death. Roentgenographic examination of the skull, especially the pituitary fossa, and of the chest showed no abnormalities.

This is the second case of proved functioning carcinoma of the islet cells of the pancreas recorded in Great Britain. Most patients are seen only after major hypoglycemic attacks have occurred, but it seems that the condition may exist unrecognized over many years, the transitory hypoglycemic attacks being rapidly corrected by mobilization of glycogen Some of the associated symptoms suggest hyperadrenalism, which may spontaneously counteract the drop of the blood sugar level by rapid glycogenolysis Pain is not a feature of the benign insulinomas, but it appears in most cases of malignant change. It is persistent and tends to radiate to the left costal margin and the back. The presence of Whipple's triad of fasting hypoglycemic attacks relieved by the ingestion of sugar and the low fasting blood sugar level in addition to pain and anorexia is a strong indication that a malignant process is occurring in an islet-tumor of the pancreas It is suggested that the changes resulting in cell imbalance are directly linked with dysfunction of the adrenosympathetic anterior pituitary mechanism, which causes proliferation of the islet cells and connective-tissues elements and results in cell imbalance and invasion of the pseudocapsule of the adenoma and transition to a carcinoma. These malignant changes are also accompanied by a proliferation and degeneration of the cells of the blood vessels in the tumor area as well as in the cells of the supporting tissues, resulting in dense fibrosis and hyalinization in the affected area One outstanding peculiarity of the malignant insulinoma is the long period during which the body is able to maintain a barrier against the further extension of the growth If the condition is diagnosed at an early stage, probably the best procedure is a wide resection, or widespread irradiation therapy may be tried

Nutritional and Electrolyte Evaluation in Massive Bowel Resection. Study of One Case and Review of Literature. D G Pietz Gastroenterology 31.56-73 (July) 1956 [Baltimore]

Pietz applies the term "massive bowel resection" to the removal of 6 ft , 7 in (200 cm) or more of the small intestine For subsequent evaluation of the patient, however, the determination of the length of functioning intestine is more important than the measurement of the surgical specimen Furthermore, variability in the length of the human intestine and the difficulty of accurately measuring the removed segment introduce further error The average length of the small intestine is 21 5 ft (657 cm), with a range of 10 to 28 ft (305 to 853 cm) depending on race, sex, and diet Since it did not appear feasible to evaluate the nutritional and electrolyte changes resulting from massive intestinal resection on the basis of the single case history presented, the author collected from the literature 42 case histories that seemed appropriate for this study The clinical and laboratory data in these 43 patients led to the following conclusions 1 The absence of all but 1 or 2 ft of mesenteric small intestine was compatible with fair nutrition and absence of diarrhea or severe metabolic disturbances 2 Metabolic alterations and significant fat losses were unusual if 6 ft or more of mesenteric small intestine remained If no other complicating factors were present, weight and general health were usually fully regained 3 Fat, nitrogen, and electrolyte excretion in the stool appeared less extensive if a segment of ileum (with or without jejunum), the ileocecal valve, and the entire colon was present as compared with a similar length of jejunum alone with a portion of colon absent 4 Steatorrhea was common in extensive resections and was due primarily to faulty absorption of fat 5 Protein loss was moderate, although this was associated with a positive nitrogen balance 6 Large losses of calcium in the stool with negative calcium balance were common in the extensive resections Hypocalcemia was present in 19% of the patients and in 75% of those with tetany. 7 The patient reported had a tendency toward hypokalemia, which did not improve on increased potassium intake or other therapeutic measures

Soft-Tissue Neoplasms Associated with Congenital Neurofibromatosis H R McCarroll J Bone & Joint Surg 38A:717-731 and 900 (July) 1956 [Boston]

The bizarre disease known as congenital neurofibromatosis has many variable clinical manifestations Soft-tissue neoplasms are commonly encountered Those of major importance are the diffuse soft-tissue hypertrophy, plexiform type of neurofibromatosis, and the primary tumors arising in the major nerve components The frequency with which malignant tumors occur cannot be stated with accuracy Hosoi has estimated that malignant tumors develop in 13% of all patients with von Recklinghausen's disease, but in the author's series of 136 cases, they were observed in only three patients Malignant schwannomas, however, have been reported more frequently in the mediastinum and retroperitoneal area, and as a result they seldom come to the attention of the orthopedic surgeon.

The soft-tissue neoplasms of this disease may be classified in two groups primary neurogenic tumors and tumors of other soft-tissue structures, although all the manifestations of neurofibromatosis result directly or indirectly from involvement of nerve tissue. Many of these lesions are of primary neurogenic origin, while others are induced indirectly by hypertrophy and proliferation within the nerves. In this group may be included the café au lait spot, verrucous skin hypertrophy, diffuse soft-tissue hypertrophy, diffuse flat hemangioma, and primary lymphatic changes. Diffuse hypertrophy of an extremity or part of an extremity commands the attention of the orthopedic surgeon Regional surgical treatment often restores function when the involvement is limited to a portion of one extremity or is manifested solely by hypertrophy of subcutaneous tissues, and it may even control the disease. When an entire extremity is involved, vascular or lymphatic changes may occur that necessitate repeated regional surgery, and amputation may even have to be considered.

One type of soft-tissue tumefaction is elephantiasis neuromatosa, which has been described by Stout. Tumefaction in the deeper, major nerves is clinically more important, since malignant changes are more likely to occur, malignant tumors, incompletely removed, may recur locally many years later. Stout states that the plexiform type of neurofibromatosis may progress continuously up a nerve or a group of nerves and may eventually involve the spinal cord This study seems to support Stout's statement that lesions in von Recklinghausen's disease are of two varieties. (1) those resulting from proliferation of sheath cells and nerve fibers and producing primary nerve-tumors, either benign or malignant, and (2) the associated or secondary lesions induced directly or indirectly by the neurofibromatous proliferations in the cutaneous, subcutaneous, skeletal, vascular, and lymphatic manifestations

NEUROLOGY & PSYCHIATRY

Eastern Equine Encephalomyelitis in Massachusetts in 1955: Report of Two Cases in Infants. W D Winter New England J Med 255.262-267 (Aug 9) 1956 [Boston].

Two cases of eastern equine encephalomyelitis, which occurred in a 7-month-old boy and an 11-month-old boy in eastern Massachusetts in September, 1955, are described The younger infant died and autopsy revealed striking hippocampal lesions characteristic of eastern equine encephalomyelitis. The older infant survived with severe permanent brain damage Two cases of eastern equine encephalomyelitis in adults in Massachusetts in 1955 were reported by other workers

An abundance of mosquitoes is a prerequisite for the appearance of eastern equine encephalomyelitis in man, and this is in turn favored by an abnormally wet period followed by a warm dry spell These conditions were present in eastern Massachusetts in the autumn of 1955, when 44 fatal cases of the disease occurred in horses and four extensive outbreaks in pheasant farms. It is probable that the virus is enzootic in wild birds and that mites and lice from these, as well as mosquitoes, may play a part in transmission, and also that conditions favorable for increase in mosquito population are associated with overflow into equine and human populations. When experimental infections were undertaken, the virus titer that developed in the horse was not infective for the mosquito. This observation suggests that the horse is merely an "indicator" species rather than a link in the epidemiological chain Control of the disease in human beings may be accomplished by mosquito-control measures and in certain situations by active immunization

Eastern Equine Encephalomyelitis in Massachusetts: Report of Two Cases, Diagnosed Serologically, with Complete Clinical Recovery. H de F. Webster. New England J Med 255:267-270 (Aug. 9) 1956 [Boston]

Two cases of eastern equine encephalomyelitis are described in a 40-year-old man and a 48-year-old woman who were admitted to the neurology service of Massachusetts General Hospital in September, 1955. The patients were residents of two different counties. Neither patient admitted to any direct exposure to sick horses; no members of either family and no infants or children were ill in their immediate neighborhoods. The man had a history and clinical course closely approximating that in other descriptions, but he never had more than 141 white blood cells per cubic millimeter in his spinal fluid, and, of these, 60% were lymphocytes. The woman was mildly confused and somnolent for several days, but her chief complaints were vertigo, nausea, and ataxia. Complement-fixation and neutralization tests performed with three serum samples from each patient revealed a serial rise in antibody titer against eastern equine encephalomyelitis, which made the diagnosis virtually certain. Both patients recovered completely. The literature to date is briefly reviewed.

Thorazine and Serpasil Treatment of Private Neuropsychiatric Patients. F. J. Ayd Jr. Am. J. Psychiat. 113:16-21 (July) 1956 [Baltimore].

Ayd reports observations on the treatment of 300 nonhospitalized private psychiatric patients, 150 of whom were treated with chlorpromazine (Thorazine) and 150 with reserpine (Serpasil). The dosage and route of administration varied with the severity and acuteness of the patient's condition. The neurotic and moderately disturbed psychotic patients received chlorpromazine in divided daily doses of 100 to 500 mg. orally or were given 0.5 to 10 mg. of reserpine orally. Disturbed schizophrenic and manic patients, who were hospitalized initially, received daily 500 to 2,500 mg. of chlorpromazine or 5 to 15 mg. of reserpine, orally and intramuscularly. Parenteral medication was usually discontinued within one week. Patients were treated for he following disorders: acute and chronic psychoneuroses, hizophrenic reactions, manic-depressive reactions, senile psychoses, and character disorders. The author believes that these drugs are valuable additions to the therapeutic armamentarium of the psychiatrist in private practice. Properly utilized, these drugs can (1) increase the number of patients who may be treated in the office; (2) shorten the period of hospitalization or make hospitalization unnecessary, thereby reducing admissions to overcrowded psychiatric hospitals; (3) replace or reduce the need for electroconvulsive therapy; and (4) reduce the cost of psychiatric care.

The Use of Frontal Lobe Procaine Injections in the Treatment of Mental Disorder. J. M. Whitworth, L. M. Weinberger, M. B. Zimbler and A. F. Paolino. Ohio M. J. 52:727-728 (July) 1956 [Columbus].

It is gradually being realized that the beneficial results, as well as the complications, of frontal lobe surgery bear relation only to the total amount of brain tissue destroyed and not to any particular tracts or fibers sectioned. Personality and intellectual dilapidations increase as more and more tissue is surgically abstracted. It follows that, since brain tract anatomy is not relevant, any method of graded destruction is suitable. An intuitive recognition of this idea led a number of workers to inject various substances into the frontal lobes. The authors list the materials that has been used and describe their own experiences with the injection of a 0.5% procaine solution in 36 patients. They found that from 20 to 30 cc. of 0.5% procaine solution injected into each frontal lobe is destructive and produces small areas of cystic necrosis.

This technique appears to accomplish much that surgical methods do, without the hazard of hemorrhage. The injections can be graded in quantity and repeated. There is no surgical aftercare, and the complications are not serious. The authors believe that procaine injections, like all other forms of physical treatment, merely treat the symptom and that the mental symptom best relieved is "tension." They are in a position to make only tentative conclusions, since all of their patients have been treated within the past year. About two-thirds have been so benefited that they can work effectively at home or at a job. Surgical and postmortem observations revealed that injections of from 20 to 30 cc. of 0.5% solutions of procaine into each hemisphere do produce focal necroses in the white matter. However, the detectable organic deteriorations are slight and can be identified only by mild impairment of memory. Gross damage to the intellect or the personality was not observed.

GYNECOLOGY & OBSTETRICS

Management of Urinary-Vaginal Fistula in 253 Cases. V. S. Counseller and F. H. Haigler Jr. Am. J. Obst. & Gynec. 72:367-376 (Aug.) 1956 [St. Louis].

Two hundred fifty-three women with urinary-vaginal fistulas were treated at the Mayo Clinic between 1933 and 1954. The most frequent type of fistula was vesicovaginal; the second in frequency was urethrovaginal, and the third was ureterovaginal. The cause of the urinary fistulas was surgical or traumatic rather than obstetric by ratio of about 8 to 1. Total abdominal hysterectomy is a much more common operation today than formerly, and it headed the list of the causative procedures, with 120 patients. These fistulas resulted from the lack of adequate exposure, bleeding and the use of many hemostats, and an attempt to keep the vagina partially or completely closed with special forceps. The number of fistulas after repair of cystocele was about equal to the number of those occurring with vaginal hysterectomy. A rather new type of vesicovaginal fistula occurred after transurethral resection of the neck of the bladder for urinary retention or obstruction.

The type of surgical treatment of the fistula depends entirely on its character, its location, and on whether it is complicated or uncomplicated. Two hundred twenty-four patients underwent direct repair, either vaginal, abdominal, or transvesical. Twenty-nine patients had indirect repair by ureterosigmoidostomy, nephrectomy, nephrostomy, ureteral reimplantation, or closure of the vagina. The vaginal approach was used in 218 of the 224 patients with direct repair, the abdominal approach in 5, and the transvesical approach in one. With vaginal repair, a primary cure rate of 88% was obtained, which is especially noteworthy when one considers that more than half of these patients had undergone repair previously from one to five or more times. If the fistula is high and cannot be exposed or if it is complicated by a rectovaginal fistula, the abdominal approach is the best. With regard to closure of the fistula, it has been found that it is far safer to repair the fistula transversely than in any other direction. The suture material was all absorbable catgut and of small caliber. All 29 patients on whom indirect operations were performed were cured in the sense that they were not leaking urine. Postoperative complications occurred almost always in those difficult cases in which there were recurrences and a diseased urinary tract. They occurred regardless of the direct or indirect procedures. The percentage of complications was much greater in the direct abdominal approach than in the direct vaginal approach. There were two postoperative deaths, but they were not related to the surgical procedure itself.

The Use of the Bioflavonoid Compounds in the Prevention or Reduction in Severity of Erythroblastosis Fetalis. W. M. Jacobs. Surg. Gynec. & Obst. 103:233-236 (Aug.) 1956 [Chicago].

This report deals with six mothers who had previously been immunized with the Rh factor and who during their present pregnancy were treated with the bioflavonoid compound, cvp. A total of 12 mothers were treated with cvp, but six were not included in this series, five of them because their babies proved to be Rh negative (all of the husbands were heterozygous positive) and one because the previous history of immunization was doubtful. The women were given six capsules (600 mg.) of the bioflavonoid compound daily. This therapy was begun before the 14th week of pregnancy, because it is believed that crossover of fetal cells does not occur prior to this time. Prevention or reduction of capillary fragility of the placenta, an antihistamine reaction, and reduction or prevention of capillary fragility in the baby are the three factors that form the basis for the use of bioflavonoid compounds in the treatment of women isoimmunized with the Rh factor.

The most dramatic results were obtained in three of the women, who, although they had previously had erythroblastotic infants, showed no titer rise throughout their pregnancies and whose present infants showed no signs of erythroblastosis fetalis. In the other three women, base-line titers, which apparently represented holdover antibody titers from previous immunization, were present early in gestation. In all of these the titer rise was only slight. Without treatment it could have been expected that these infants would have been at least as severely affected as their predecessors, and probably more so; however, they were healthier and less severely affected than the previous infants. In accordance with the routine treatment for infants with erythroblastosis fetalis, these infants were given exchange transfusions, but it was believed that, because of the mild form of erythroblastosis, exchange transfusion was probably not necessary. Although the number treated is small, the author feels that there is evidence that the bioflavonoid compounds do have some value in the prevention of erythroblastosis fetalis or that they will at least reduce its severity.

The Treatment of Premenstrual Tension with a Combination of an Antihistaminic and a Theophylline Derivative. T. H. McGavack, H. J. Spoor, M. L. Stone and S. Pearson. Am. J. Obst. & Gynec. 72:416-422 (Aug.) 1956 [St. Louis].

Forty-three patients between the ages of 14 and 50 years with premenstrual tension were given a compound in tablet form, consisting of 50 mg. of 2-amino-2-methyl-1-propanol-8-bromotheophyllinate and 30 mg. of pyrilamine maleate (neoBromth). Seventeen of these patients had frank edema; 12 had water retention as shown by pronounced changes in weight and tightness of shoes, but no obvious edema; and 14 had no clinically recognizable water retention. The frequency and amount of dose of the drug were varied to suit individual needs. Therapeutic doses ranged from 2 tablets (160 mg.) twice to four times daily for from 3 to 10 days before the onset of menstruation. In three patients continuous administration proved advisable. Slight, moderate, pronounced, and complete relief were obtained by 8, 9, 14, and 4 patients respectively. Eight patients were therapeutic failures. Of all the manifestations, water retention was the one most consistently favorably influenced, and the nervous and mental symptoms of tension were next. Breast engorgement, gastrointestinal symptoms, and pelvic manifestations were controlled in most of the patients, and marked improvement in headaches occurred in slightly over half the patients. Adolescent or pubertal acne with normal premenstrual periods of aggravation was improved in 15 of 22 patients. No undesirable side-effects were observed with doses of up to 4 tablets (320 mg.) four times daily (a total daily dose of 1,280 mg.) for four consecutive weeks of administration. The theophylline-antihistamine combination employed is a useful aid in the management of premenstrual tension, particularly when associated with high degrees of water retention.

PEDIATRICS

Complications of Smallpox Vaccination and Their Treatment with Vaccinia Immune Gamma Globulin. R. Lundström. J. Pediat. 49:129-140 (Aug.) 1956 [St. Louis].

Serious complications of smallpox vaccination are rare. A survey is given of such complications, as well as of their incidence in Sweden. During a five-year period, there were two deaths from eczema vaccinatum, both in unvaccinated infants, and two deaths from postvaccination encephalitis. The author stresses the importance of making a sharp distinction between generalized vaccinia, eczema vaccinatum, and gangrenous vaccinia. The clinical picture of fetal vaccinia resembles that of gangrenous vaccinia. Some cases of unusual complications and of vaccination combined with other illnesses are described. Kempe's vaccinia immune gamma globulin, prepared by fractionation of blood from newly vaccinated persons and distributed by the State Bacteriological Laboratory of Sweden, is both a preventive measure against complications and a treatment for them. In vitro experiments showed it to have a high content of antibodies to the variola and vaccinia viruses, about 10 to 20 times higher than that of ordinary gamma globulin preparations. The main indications for its use are prevention of spreading of vaccinia to patients with eczema who have been in contact with newly vaccinated persons; treatment of newly vaccinated persons suffering from or contracting another serious disease; and in cases of generalized vaccinia, eczema vaccinatum, and gangrenous vaccinia. The preparation should be tried when there is a risk of corneal lesions as well as in postvaccination encephalitis, since specific therapy for these conditions is lacking. When a smallpox epidemic threatens, the preparation can presumably be used as an adjuvant in prophylaxis. If specific immune gamma globulin is not available, other gamma globulin preparations should be used in large doses. They should preferably be prepared from the blood of military personnel, who are generally vaccinated on induction. The author reports a case of generalized vaccinia with hypogammaglobulinemia, in which gamma globulin partly derived from such a source was successfully used.

Gas Gangrene of the Colon in a Newborn Infant: Report of a Case Successfully Treated by Total Colectomy. E. Haigh. Brit. J. Surg. 43:659-661 (May) 1956 [Bristol, England].

A case of gas gangrene involving the lower ileum and the entire colon in a newborn baby boy is described. Laparotomy was performed through a transverse supraumbilical incision and resection was carried out through normal intestine just above the Meckel's diverticulum to the rectosigmoid region. An ileoproctostomy was performed. Large doses of penicillin and gas gangrene serum and a transfusion of 85 cc. of blood were given. Gastric suction and intravenous therapy had been instituted preoperatively and were continued postoperatively. The postoperative course was entirely satisfactory. At first the infant had seven or eight semiformed stools a day, but he developed normally and gained 6 oz. a week. He was discharged after one month. At the age of three months he had only three to five normally formed stools daily and was gaining well. At one year of age he weighed 23 lb. (10.4 kg.) and had only one or two stools a day. The extensive resection thus was not followed by permanent diarrhea, malnutrition, or retardation of general development. It is suggested that the infection developed by direct invasion through the mucosa from an acute anaerobic enteritis. Total colectomy in the newborn may be a practicable procedure for other conditions.

DERMATOLOGY

A Comparison of Chloroquine and Gold in the Treatment of Lupus Erythematosus. J. T. Crissey and P. F. Murray. A. M. A. Arch. Dermat. 74:69-72 (July) 1956 [Chicago].

Crissey and Murray compared the therapeutic effect of chloroquine with that of gold sodium thiosulfate in the treatment of chronic discoid lupus erythematosus. Remissions were obtained in 57 of the 66 patients treated with the gold preparation and in 21 of the 24 treated with chloroquine. Thus, there was no significant difference in the proportion of patients who responded to these drugs. Patients treated with chloroquine responded more rapidly than those treated with gold. There was a significantly greater number of recurrences within a year after treatment with chloroquine than after gold. Data collected since this study suggest that this recurrence rate can be materially reduced by continuing administration of small doses of chloroquine for several months after clinical remission has taken place. The advantage of oral administration of chloroquine over the injection of the gold preparation is evident. Gold is known to cause side-effects, but the authors observed no serious side-effects from chloroquine.

Changing Therapy in Cutaneous Tuberculosis. A. W. Glick. J. Mt. Sinai Hosp. 23:537-549 (July-Aug.) 1956 [New York].

Glick differentiates three types of cutaneous tuberculosis: (1) primary tuberculoses, in which tubercle bacilli can be readily demonstrated by direct examination culturally and/or by animal inoculation; (2) tuberculids, in which organisms are rarely if ever demonstrated and which are of an allergic nature with foci of active tuberculosis elsewhere; and (3) the fringe group, among which are sarcoid and possibly the rosacea-like tuberculid of Lewandowski. He discusses the first two groups. Before the use of isoniazid, calciferol was the best single agent for the treatment of cutaneous tuberculosis. Calciferol produces clinical cures in possibly 50 to 75% of the cases in which it is used. It does produce toxic symptoms, some of which may be permanent, such as impairment of renal function. It seems to be contraindicated in cases of erythema induratum. Thiosemicarbazone seems to be of value in erythema induratum and in tuberculosis of mucocutaneous surfaces, but it produces many toxic symptoms. Streptomycin is very useful as a single remedy, but resistance of the bacillus to the drug can develop. Aminosalicylic acid has little value when used alone. Many investigators feel that various combinations of the above agents produce better results than any single one. Isoniazid has been in use for only a few years. Its final evaluation will take time, but it is possibly the best single drug presently available. It has fewer side-effects, produces faster results, and does not cause the tubercle bacillus to become resistant. The consensus seems to be that combination therapy with the above agents will become the method of choice.

OTOLARYNGOLOGY

Multiple Paragangliomas in the Head and Neck: Case Report. J. J. Conley. Ann. Otol. Rhin. & Laryn. 65:356-360 (June) 1956 [St. Louis].

The patient was a 26-year-old woman with an asymptomatic lump in the left side of the neck. It had been present for three weeks and had gradually increased in size, but it was not associated with pain, pressure, or syncope. There was moderate, diffuse, bilateral cervical lymphadenopathy and a firm node in the region of the carotid bifurcation on the left side. The node was intimately related to carotid artery pulsations and was not compressible. There were paralysis, atrophy, and fibrillation on the right side (contralateral) of the tongue, with inability to protrude this side of the tongue. There was a complete nerve-type deafness in the right ear. A carotid body tumor was removed from the bifurcation of the internal and external carotid arteries at the level of the carotid bulb on the left side. The carotid arteries were not injured. The postoperative course was uneventful. Eight months later the patient complained of a sensation of fulness in the right ear, and examination revealed a reddish prominence entering the tympanic cavity from the region of the jugular bulb. A glomus jugular tumor was removed from the right ear through an endaural approach. The tumor arose from the dome of the jugular bulb in the region of the floor of the tympanic cavity and extended into the inferior part of the cochlea with destruction of the inferior aspect of the promontory of the cochlea. There was also destruction of the bone behind the descending portion of the facial nerve. The facial nerve was not injured during operation. Postoperatively the patient had severe vertigo for about 10 days. This gradually subsided. Recent examination of the woman failed to reveal any abnormality.

Approximately 350 carotid body tumors and 102 glomus jugulare tumors have been reported in the literature, but multiple and bilateral paragangliomas in the head and neck are exceedingly rare. These tumors are asymptomatic in their early stages. As they increase in size, they may cause pain, pressure, or syncope or may affect a special organ. This is particularly true in glomus jugulare tumors, which may produce vertigo, deafness, cranial nerve involvement, and discharge from the ear.

Otolaryngologic Aspects of Hypometabolism. J. A. Hilger. Ann. Otol. Rhin. & Laryng 65:395-413 (June) 1956 [St. Louis].

The thyroid hormone is the essential regulator of cellular oxidation. Hypometabolism can result from impaired function at any level in the chain from pituitary to thyroid. Four etiological forms have been postulated: hypothalamic, pituitary, athyreotic, and somatic or peripheral. The advanced degree of athyreotic hypometabolism causing widespread mucoproteinous changes in the tissue ground substance is commonly called myxedema. This is but one form of hypometabolism and is relatively uncommon, whereas various other hypometabolic conditions are common. They are characterized by a wide range of nonspecific symptoms headed by fatigability and intolerance to cold. These patients are often classified as psychoneurotics. Coarse hair, thick skin, infertility, sluggish mentality, and bradycardia are indicative of hypometabolism. The basal metabolic rate is useful in diagnosing hypometabolism. The radioiodine methods may falsely suggest that a euthyroid is low and a hypothyroid is normal. The chemical determination of the protein-bound iodine of the plasma is the most reliable method. Second in value is the basal metabolic rate determination.

Hypometabolism is a frequent cause of otolaryngologic presenting symptoms. Chronic vocal cord edema not associated with inflammatory reaction is strongly suggestive of hypothyroidism. The cord is firm, not deeply reddened unless it bears the brunt of excessive vocal trauma, and the edema is uniform over the whole cord. Because of greatly increased cordal thickness, the voice is hoarse and of low pitch. Advanced degrees of cordal myxedema may result in diffuse polypoid change requiring surgical stripping. Separation of the edematous masses from the underlying elastic tissues of the cord is relatively easy with the cupped forceps technique. The focalized myxedema and polyps will recur if the hypothyroidism is unsuspected and untreated. The author describes the history of a woman to illustrate the effect of thyroid replacement therapy and the improvement in laryngeal function after stripping of the vocal cords. He also presents the case of a man with myxedema in whom the upper respiratory and pharyngeal mucosa was thick and edematous. Thyroid replacement therapy proved essential. Observations on this patient also demonstrated the poor healing tendency of the tissues in the presence of severe hypothyroidism. On the basis of another case history the author shows that mucoproteinous edema of the nasal mucosa is productive of chronic nasal obstruction. Here again adequate thyroid replacement will be effective, though surgery and allergic management may have failed. With regard to the external and middle ear, the author says that one of the usual symptoms of hypothyroidism is a reduction of sweat gland activity. Frequently the function of ceruminous glands suffers the same fate. The resulting dry, itching external ear is a frustrating problem unless the thyroid deficiency is recognized and treated.

The symptoms of mucoproteinous edema of the pharynx are chronic and long-standing and are variously described as "sore throat," "throat discomfort," "lump in the throat," etc. A pale and glossy edema of the pharyngeal mucosa is sometimes discernible. A search will usually elicit a history of additional systemic symptoms of hypothyroidism. When the specific diagnostic tests are confirmatory, the results of thyroid therapy are gratifying. Headache of vascular character and distribution is not uncommon as a presenting symptom in the hypothyroid patient It is relieved by adequate thyroid replacement.

The acoustic and vestibular disturbances resulting from endolymphatic hypertension, which have been referred to as Ménière's disease, endolymphatic hydrops, or labyrinthosis constitute a disorder of multiple etiology, but one in which in many patients endocrine imbalance plays an important part If the patient with endolymphatic hypertension is found to be wanting in thyroid hormone, replacement therapy with thyroid hormone is justified. Otosclerosis and endolymphatic hypertension sometimes coexist. Here an appreciation of the influence of the hypometabolic state on the inner ear is valuable preoperatively and postoperatively. It may alter the long-term results of surgical treatment in otosclerosis.

THERAPEUTICS

Intramuscular Trypsin in the Treatment of Acute Thrombophlebitis. W. A. Reid and A. H. Wilkinson, Jr. J. M. A. Georgia 45:351-353 (Aug.) 1956 [Atlanta].

Sixty patients between the ages of 3 months and 85 years with an acute attack of thrombophlebitis or with an acute exacerbation of the relapsing syndrome were treated with bed rest, elevation, and antibiotics at the Grady Memorial Hospital between Oct. 1, 1954, and Aug. 15, 1955. Thirty of the 60 patients received in addition intramuscular injections of trypsin, and the other 30 were given anticoagulant therapy and served as controls. Intramuscular injections of 2.5 mg. (0.5 cc.) of trypsin (Parenzyme) deep in the muscles in alternating gluteal regions were given every eight hours. Since contact with water diminishes the activity of trypsin, thoroughly dry syringes have been used for its administration. The patients were evaluated daily. In both the control and the therapeutic trial group the drugs were withdrawn as soon as the patient became asymptomatic. The next day the patient became ambulatory, and if symptoms did not recur the patient was discharged on the third day of observation. If symptoms recurred with ambulation, therapy was restarted.

The general clinical response in patients receiving trypsin was comparable to or even better in some respects than that in those receiving anticoagulant therapy. The average number of days elapsing before the patient became asymptomatic was 1.3 shorter in the group receiving trypsin intramuscularly. The time required for patients to become free of pain was also less in the group treated with trypsin than in that treated with anticoagulants. Local toxic effects, pain, and induration, as noted in a total of 867 injections, were minimal and never necessitated withdrawal of trypsin. This probably resulted from the careful administration of the drug deep in the gluteal muscle. The deltoid muscles were never used. No generalized toxic reactions or postoperative complications, such as impairment of wound healing or hemorrhage, were noted to suggest the possibility of afibrinogenemia, which has been reported by other workers. It was necessary to discontinue anticoagulant therapy because of bleeding in 5 of the 30 patients treated with heparin and bishydroxycoumarin (Dicumarol). The total number of hospital days was 3.9 less in the group treated with trypsin than in that treated with anticoagulants. Clinical evidence of nonfatal pulmonary infarction occurred in two patients treated with trypsin intramuscularly. Continued study is essential for the proper evaluation of the effectiveness of intramuscular therapy with trypsin in thrombophlebitis.

Novobiocin in the Treatment of Surgical Infections Due to Staphylococci and Other Gram-Positive Bacteria. A. M. Rutenburg, P. Shapiro and F. Schweinburg. New England J. Med. 255:325-330 (Aug. 16) 1956 [Boston].

In vitro studies with novobiocin (Cathomycin), a new antibiotic isolated from cultures of Streptomyces spheroides, showed the extreme effectiveness of the drug against most strains of micrococci (staphylococci) and streptococci, and its particular usefulness against micrococci resistant to other antibiotics. Except for some strains of P. mirabilis and Ps. fluorescens, novobiocin was not effective against the gram-negative bacilli tested.

Thirty patients with a variety of surgical infections caused by hemolytic micrococci and other gram-positive bacteria were treated with novobiocin. Twenty-three of the 30 patients had failed to respond to previous therapy with other antibiotics such as penicillin, streptomycin, tetracycline, chlortetracycline, bacitracin, and erythromycin. The remaining seven patients had had no previous therapy. No other antibiotics were given in combination with novobiocin. The drug was administered orally; 1 gm. was given initially and 1 to 1.5 gm. in divided doses daily thereafter. Most patients received 0.25 gm. every six hours. The drug was absorbed rapidly after the administration of this dose, and plasma concentrations ranged from 6 to 46 mcg. per cubic centimeter. The average duration of treatment was 10 days. The therapeutic results were good in 28 patients who responded within 48 hours with rapid and progressive improvement; local and systemic evidence of infection subsided, drainage from the infected wounds decreased and became sterile, and the wound healed. The results in the remaining two patients were considered poor. One of them had extensive wound infection and slough after partial resection of irradicable carcinoma of the thyroid and tracheotomy, and various bacterial strains were cultured from his wound; of these strains only hemolytic Micrococcus (Staphylococcus) aureus was sensitive to novobiocin. The second patient had a urinary-tract infection caused by novobiocin-resistant bacteria and an ulcerated lesion of the toe with underlying osteomyelitis. Hemolytic M. aureus sensitive to novobiocin was cultured from the wound. The patient failed to improve because of inadequate peripheral arterial circulation.

Novobiocin was well tolerated. Only 2 of these 30 patients and an additional 60 patients who received the drug for prophylaxis or for the treatment of various medical infections had mild gastrointestinal side-effects. Both recovered promptly after the drug was withdrawn. There were no other systemic reactions.

The New Dehydrocortisone Drugs (Prednisone and Prednisolone) as Antireactive Medicaments of Choice in the Treatment of Pulmonary Tuberculosis. M. Reale, A. Garaventa, G. Paoli and G. Costa. Minerva med. 47:1764-1773 (June 6) 1956 (In Italian) [Turin, Italy].

The authors studied the effect of prednisone and prednisolone on 30 patients with pulmonary tuberculosis. Eight patients had localized, early, and clinically primary forms of the disease; 12 had the diffused type of infection; 6 had tuberculosis of the serous membranes; 1 had silicosis; and 3 had bronchial asthma. Observations were continued for a few months after treatment. Prednisone was given to 15 patients, prednisolone to 14, and 1 patient was given both drugs in succession. The starting dose was 30 mg. per day, given in five portions of 6 mg. each. The diet was controlled in order to facilitate the assimilation of the drug. The starting dose was continued for 10 to 20 days. The daily dose was then gradually decreased to 25, 20, and 15 mg. Subsequently, doses of 10 and 5 mg. were continued depending upon the condition of each patient. The average total dose was 1,000 mg.; patients with milder forms of the disease received from 600 to 700 mg. Treatment lasted from 40 to 60 days. Used with specific antimycobacterial therapy, these two drugs have in the progressive stage of tuberculosis an immediate clearing effect upon the perifocal inflammation. Rapid and progressive clearing, healing of the tuberculous lesions, and disappearance of toxic symptoms follow. The effect is suppressive in clinically primary isolated forms that are caused by germs sensitive to tuberculostatic drugs. The effect is only temporary in the progressive stages of diffused chronic advanced phthisis that are often resistant to antimycobacterial drugs.

Pharmacology of Mecamylamine. R. V. Ford, J. C. Madison and J. H. Moyer. Am. J. M. Sc. 232:129-143 (Aug.) 1956 [Philadelphia].

The pharmacological effects of mecamylamine (Inversine), a new ganglionic blocking agent with the structural formula 3-methylaminoisocamphane, were tested in 17 dogs. The effects of stimulation of the distal end of the vagus nerve after the parenteral administration of increasing doses of the drug were used to determine the site of action of mecamylamine. The blood pressure response to carotid occlusion was also observed. The curves of the blood pressure response to increasing doses of mecamylamine and of hexamethonium were compared. The effects on renal clearances of *p*-aminohippurate and creatinine, as well as on water and electrolytes (sodium and potassium), were also observed in these dogs. Mecamylamine blocks the transmission of impulses through the sympathetic and parasympathetic ganglions. The duration of the ganglionic blockade was from 10 to 20 times longer than that produced with hexamethonium. The renal hemodynamic response to mecamylamine was associated with a prompt decrease in mean blood pressure. The glomerular filtration rate and the renal blood flow showed a significant decrease from one to three hours after the administration of mecamylamine. There was no statistically significant change in electrolyte excretion after the drug was administered.

The pharmacological effects of mecamylamine were studied in 55 patients with hypertension, 36 of whom were ambulatory outpatients and 19 of whom were hospitalized. The fact of the complete absorption of mecamylamine when administered orally was illustrated by comparison of the effects of the drug when given in comparable doses orally as well as parenterally. The problem of tolerance was illustrated by the hospitalized patients who were observed very closely while receiving the drug in progressively increasing dosage. Partial tolerance to the drug developed but was overcome by a second "titration" of the drug. Frequently the dose requirement later decreased slightly after the blood pressure had been regulated for a prolonged period of time. The most important pharmacological attributes of mecamylamine are its long duration (average 17 hours) and prompt onset (average 68 minutes) of action and its complete absorption when administered orally. Comparison of treatment programs consisting of one, two, or three divided doses daily revealed no significant difference between the programs in degree of side-reactions or percentage of patients achieving satisfactory control. However, in routine clinical use for the treatment of ambulatory outpatients, the general experience indicates a preference for at least a three-dose-a-day treatment program with the largest dose given at noon. The average dose of mecamylamine required to produce significant effects was 28 mg. per 24 hours, while with hexamethonium it was 2,307 mg. per 24 hours and with pentolinium 341 mg. per 24 hours. The percentages of patients achieving a responsive level were 90, 76, and 79 respectively. The percentages of patients becoming normotensive were 34, 37, and 33 respectively. Marked reduction in blood pressure for a long period of time was also accompanied by a reduction in the glomerular filtration rate and renal plasma flow, particularly in patients with severe hypertension before the institution of therapy. Mecamylamine is the drug of choice in the treatment of patients with moderate to severe hypertension.

Drug Therapy of Hypertension: II. Experience with Reserpine, Apresoline, Ansolysen, Ecolid, and Mecamylamine (Inversine). M. Moser, A. I. Macaulay, R. Granzen and K. W. Trout. New York J. Med. 56:2487-2497 (Aug. 15) 1956 [New York].

Twenty-five men and 35 women between the ages of 24 and 76 years with severe hypertension and evidence of renal, cerebral, or cardiac complications were treated with reserpine and hydralazine (Apresoline) alone or in combination with either chlorisondamine (Ecolid) chloride, pentolinium (Ansolysen) tartrate or mecamylamine (Inversine). Therapy was usually begun in the hospital, and patients were discharged only after stabilization of dosage was achieved. Both a sustained, unequivocal drop in blood pressure and clinical improvement with minimal side-effects were obtained in 24 patients who received combined treatment with reserpine, hydralazine, and pentolinium. In several of these patients whose pressures had been reduced to and maintained at normotensive levels for one year or longer, it has been possible to reduce the dosage of drugs without altering the response. In an additional 15 patients a satisfactory blood pressure response has occurred, but other criteria for an excellent response have not been met.

Six patients who had been on pentolinium therapy for periods of from six months to one year and who had achieved a satisfactory blood pressure were placed on chlorisondamine chloride therapy. The average dose of pentolinium that had been required to maintain the response was 450 mg. daily in four divided doses. An average daily dose of 150 mg. of chlorisondamine chloride given in two or three divided doses proved to be effective in producing an equivalent response. In two patients there was a further drop in blood pressure with chlorisondamine chloride. Persistent blurring of vision, however, which did not respond to the use of pilocarpine given orally or pilocarpine eye drops, was the most distressing side-effect of this drug. Twenty-six patients were treated with mecamylamine, a new potent ganglionic blocking agent, in combination with hydralazine and/or reserpine. Twelve of these patients had received pentolinium for from three months to two years before mecamylamine therapy was started. Excellent results were obtained in 7 patients, good results in 10, and 9 were therapeutic failures. Severe constipation and/or abdominal cramps constituted the only serious side-effect of mecamylamine therapy. Patients who had been on pentolinium therapy usually had fewer side-reactions with mecamylamine, but this may have been the result of an adjustment to previous ganglionic blockade. Some tolerance to mecamylamine was noted in all patients after from one to three weeks, but this was usually overcome by increasing the dosage. The average total daily dose of mecamylamine that proved to be effective was 34 mg. The range of the effective dose varied between 12 and 60 mg. daily. The over-all percentage of patients considered to have experienced a good or excellent response to pentolinium or mecamylamine therapy in combination with reserpine and/or hydralazine was 65%.

Two New Ganglion-Blocking Agents in Treatment of Hypertension. S. Locket. Brit. M. J. 2:116-122 (July 21) 1956 [London, England].

Two active members of a recently described group of ganglion-blocking agents, namely, N^1, N^1, N^2-trimethyl-N^1-(6-cyano-6, 6-diphenylhexyl) ethylene-1-ammonium-2-morpholinium dichloride (356c54) and the 5-cyano-5, 5-diphenyl-pentyl homologue (139c55 or Presidal), were given to 5 men and 10 women between the ages of 23 and 59 years with severe hypertension. Oral, intravenous, and subcutaneous administration were each tried, but the best hypotensive effect was obtained by the subcutaneous route. The minimal effective single therapeutic dose of 356c54 by this route was 10 mg. and the maximum dose found necessary was 40 mg. With 139c55 the comparable doses were approximately half of these and the maximal subcutaneous dose used in treatment was 27.5 mg. Results were most satisfactory. The ability to maintain a sustained hypotension for from 7 to 24 hours with 356c54 and for even longer with 139c55 resulted in a rapid relief of symptoms and a reversion to normal of many of the changes known to be associated with persistent severe hypertension. Attacks of left ventricular failure stopped when treatment began, breathlessness was relieved, and angina of effort ceased to occur. When electrocardiographic changes occurred, they were towards normal, and the size of the heart was reduced. Evidence suggested a decreased liability to thrombosis in arteriosclerotic vessels. The advantages of the compounds, particularly of 139c55, in the treatment of hypertension lie in the more gradual onset of activity; the greater duration of action, which makes treatment possible with a single or at most two daily injections; the slowing effect on the heart rate; and the relative lack of action on the small intestine.

Hydrocortisone Aerosol Associated with Tuberculostatic Therapy in the Treatment of Collateral Tubercular Bronchitis. M. Reale, G. Paoli and G. De Caro. Minerva med. 47:1773-1776 (June 6) 1956 (In Italian) [Turin, Italy].

The authors gave hydrocortisone aerosol to 20 patients being treated with antibiotics. Fifteen patients had collateral bronchitis with very advanced cavitary phthisis, and five had bronchial syndromes. The dose was 1 cc. of microcrystalline suspension of hydrocortisone acetate, which corresponds to 25 mg. of cortisone. Therapy with antibiotics was continued after treatment with hydrocortisone was stopped. The effect of the new drug was very good. Almost at once the patients felt well; they could sleep at night, their appetite reappeared, they gained from 4 to 6 lb. in weight, and their fever decreased. The general well-being could probably be attributed to the euphoristic effect of the drug. The effect of the drug, however, lasts only as long as it is being given. The drug does not have a curative effect but a symptomatic one. The results of the drug are permanent only in so far as the combined therapy with antibiotics has an effect on the tuberculous process. The results are transitory when the tuberculous lesion cannot be checked with antibiotics. The drug has no side-effects.

PATHOLOGY

The Glomerular Lesions of Diabetes Mellitus: Cellular Hyaline and Acellular Hyaline Lesions of "Intercapillary Glomerulosclerosis" as Depicted by Histochemical Studies. E. E. Muirhead, P. O'B. Montgomery and E. Booth. A. M. A. Arch. Int. Med. 98:146-161 (Aug.) 1956 [Chicago].

Muirhead and associates point out that Kimmelstiel and Wilson and Murakami, in 1936, established the identity of special glomerular lesions in association with diabetes mellitus. Since then considerable interest has centered about the location, composition, and pathogenesis of glomerular changes in diabetes. This paper is concerned with the results of the application of a series of histochemical procedures to the kidneys from six diabetic subjects. Two hyaline lesions are observed within the glomeruli of kidneys of diabetic subjects. One lesion tends to be nodular and is both cellular and collagenous. For this structure the term "cellular hyaline lesion" is preferred. The other lesion is crescentic, globular, oval, or elongated and is acellular. It has the same appearance as the hyalin of arteriolosclerosis. For this structure the term "acellular hyaline lesion" is preferred. The cellular hyaline lesion is commoner than the acellular hyaline lesion. In some kidneys, however, one lesion is encountered as often as the other. The acellular hyaline lesion displays the staining characteristics of "fibrinoid." A series of histochemical procedures applied to this substance demonstrates the presence of multiple ingredients, such as triglycerides, fatty acids; phosphatides, cholesterol, and its esters; aldehyde groups likely associated with polysaccharides, mucopolysaccharides, mucoproteins, glycoproteins, glycolipids, or unsaturated lipids; sulfuric acid esters of polysaccharide origin; free carbonyl groups; free potassium, and protein-bound sulfhydryl groups. The cellular hyaline lesion has the staining characteristics of collagen. The above histochemical procedures with this structure yield either negative or minimal results, except for the periodic acid–Schiff reagent procedure, which is positive.

The staining and histochemical characteristics of the acellular hyaline lesion are identical with those of the hyalin of hyaline arteriolosclerosis. The disposition of the acellular hyaline material is considered in keeping with an intracapillary position. It is suggested that the glomerular acellular hyaline masses are derived from the hyalin of the arteriole by embolization. Rupture of the material through the capillary wall can account for its presence in Bowman's space and certain tubules. Reasons have been cited for the view that vascular fibrinoid is derived from altered smooth muscle of the media. The considerations of the present study suggest a similar origin from smooth muscle for the acellular hyaline lesion of the glomerulus of diabetic subjects. The pathogenetic relationship between the cellular hyaline and acellular hyaline glomerular lesions of diabetes remains obscure.

Phaeochromocytoma: Catechols in Urine and Tumour Tissues. H. Weil-Malherbe. Lancet 2:282-284 (Aug. 11) 1956 [London, England].

Studies of tumor tissue from a patient with pheochromocytoma showed that the tumor contained, in addition to adrenaline and noradrenaline, considerable amounts of 3-hydroxytyramine and 3:4-dihydroxyphenylalanine (Dopa). A second tumor, discovered at autopsy, contained similar amounts of adrenaline and noradrenaline, but very little hydroxytyramine and Dopa. The tumor specimens were received as solid pieces of tissue immersed in 0.1 *N* hydrochloric acid. The time intervals between surgical removal or death and immersion in acid were about 3 hours and 16 hours. Both samples remained in acid *for about 24 hours before being analyzed.* Three catecholamines were extracted from the urine of the patient with pheochromocytoma. The excretion of noradrenaline is known to be greatly increased in patients with pheochromocytoma, and this was also found in the present case. There was in addition an increase of hydroxytyramine proportionately as large as or larger than the increase of noradrenaline excretion. The urine was examined again after the patient had been on a protein-free diet for two days. This regimen did not greatly affect the excretion of adrenaline or of noradrenaline, but it decreased the excretion of hydroxytyramine. After the operation the excretion of all three catecholamines returned to normal. Hydroxytyramine and Dopa, found in the first tumor, are substances previously not demonstrated in pheochromocytoma. The lower concentrations of hydroxytyramine and Dopa in the second tumor may have been due to postmortem decomposition.

Bacteriologic Study of Human Liver in One-Hundred-One Cases. P. From and J. H. Alli. Gastroenterology 31:33-38 (July) 1956 [Baltimore].

The liver has been regarded by some as a filtering organ for various types of microbial life, because it has been observed that the addition of broad-spectrum antibiotics to the diet of rats permits survival of these animals under conditions that would otherwise produce a diffuse hemorrhagic necrosis of the liver. If the antibiotic is given orally the effect may well be a result of the change in intestinal flora; if, on the other hand, the antibiotic is given parenterally, the effect might be due to specific changes within the liver. However, if this improvement is specifically due to the antibiotic effect, there should be some proof that organisms do reside in the liver. The authors undertook a bacteriological study of human liver specimens obtained with peritoneoscopic biopsy forceps from 101 patients. Sterile technique was practiced. The liver specimens of 13 of the patients yielded bacterial organisms. The authors believe, however, that all the organisms encountered in the liver biopsy cultures were contaminants. None of the organisms was found in any predominance on streaked, selective, solid media, and all the organisms obtained from cultures of liver were also observed from cultures obtained in the endoscopy room after 20-minute exposure of selective plates. Thus the statement that the liver acts as a filtering agent for microorganisms could not be corroborated, and the conclusion is reached that the human liver does not harbor bacteria and has no normal flora. The possible benefits from the use of the broad-spectrum antibiotics in nonbacterial, nonparasitic, and nonmycotic liver disease appear to be due not to a direct antibiotic effect within the liver but to changes that may occur in the intestinal flora.

Identification of Hydroxytyramine in a Chromaffin Tumor. M. McMillan. Lancet 2:284 (Aug. 11) 1956 [London, England].

The possible synthesis of adrenaline and noradrenaline in the body with hydroxytyramine as an intermediate was suggested in 1942 by Blaschko. Hydroxytyramine occurs in the urine of animals. In man its excretion is sometimes five times greater than that of noradrenaline. It has not been detected in mammalian tissues containing a high proportion of noradrenaline, nor has it been found after exhausting the adrenal by excessive secretion or by interfering with normal sequences of synthesis using antimetabolites. Its absence has thrown doubt on its function as a precursor.

Hydroxytyramine in large amount with some noradrenaline was detected in a biopsy specimen taken from a girl, aged 18, with a paraganglionic tumor considered to be malignant, and with fluctuating hypertension. Hydroxytyramine and noradrenaline were identified by their RF values. No trace was found of various other compounds, including adrenaline. This is apparently the first occasion on which hydroxytyramine has been reported as the predominant catecholamine in a pheochromocytoma. There have been several reports of its absence from tumors, but Manger and others reported its presence with adrenaline and noradrenaline in only one of 35 tumors examined chromatographically, and related it to postmortem change in an embalmed specimen. The urine of a patient with a pheochromocytoma containing 0.05 mg. of adrenaline and 8.4 mg. of noradrenaline per gm. of tumor yielded as much as 2,000 mcg. daily with similar amounts of noradrenaline. In the present case there was no correlation between the composition of the tumor and the urinary excretion. The presence of hydroxytyramine in an apparently malignant tumor is of interest, for many pheochromocytomas with metastases have been described as being biologically inert. Of the relatively few tumors that have been biologically active and that have been examined for their catecholamine content, still fewer have been classified as malignant, and these have been said to contain adrenaline and noradrenaline only. The relationship between hydroxytyramine and malignancy merits further study.

Pathogenesis of Endocardial Fibro-Elastosis. W. J. S. Still and E. H. Boult. Lancet 2:117-118 (July 21) 1956 [London, England].

Congenital endocardial fibroelastosis is usually present at birth. It is characterized by diffuse thickening of the endocardium, which is sometimes 10 times as thick as healthy endocardium. The process is found chiefly in the left ventricle, involving the valves in about half of the cases. Cardiac hypertrophy is invariably present, and most infants die from cardiac failure in the first year of life. Material from six infants, aged 6 to 9 months, who had uncomplicated endocardial fibroelastosis was studied by electron microscopy. The surface of the left ventricle was washed and the endocardium from various parts peeled off in superficial and deep layers. Samples from both layers were teased out and ground up, at a controlled temperature, to make fine suspensions in distilled water. Each suspension was divided into two parts, of which one part was digested in 2% chymotrypsin for four hours at 37 C to destroy fibrin without materially affecting collagen or elastic tissue. All the suspensions were stained with a 0.1% solution of phosphotungstic acid to simplify electron microscopy and were washed in distilled water. A drop of each suspension was deposited on four copper grids previously covered with "Formvar" membranes and air-dried. The preparations were shadowed with gold-palladium at an angle of 2:1, and all the grids were scanned at a magnification of 2,000, selected fibers being photographed at a magnification of 10,700.

The electron microscopic structure of the predominating fibers in the surface layers of the fibroelastotic endocardium was indistinguishable from that of fibrin, which seems to suggest that they are derived from blood by the incorporation of fibrin deposits. Nevertheless, ordinary histological investigation does not reveal evidence of the deposition of fibrin on the endocardium, but there may be two reasons for this: (1) the fibrin may have been deposited in utero, as suggested by the condition in premature stillborn infants; and (2) possibly the fibrin is deposited in very thin films and immediately incorporated in the endocardium, thus becoming no longer recognizable as fibrin. While the incorporation of fibrin is an important factor in the thickening of the endocardium in congenital endocardial fibroelastosis, the authors do not imply that it accounts for the whole process. Muscle necrosis with replacement fibrosis at the myoendocardial junction seems to indicate that some process there is also involved.

BOOK REVIEWS

Handbook of Poisons. By Robert H. Dreisbach, M.D., Ph.D., Professor of Pharmacology, Stanford University School of Medicine, San Francisco. Cloth. $3. Pp. 426, with illustrations. Lange Medical Publications, P.O. Box 1215, Los Altos, Calif., 1955.

There has been a need for a compact book that summarizes information on commercially available poisonous chemicals. The author has undertaken to provide a concise summary of the diagnosis and treatment of the clinically important poisons. The book provides a digest of general considerations in treatment of poisoning and discusses pesticides and other agricultural poisons as well as industrial hazards, household chemicals, medicinal poisons, and plant and animal hazards. Appendixes illustrating and describing mechanical resuscitation equipment, drugs, and equipment in the treatment of poisoning and first-aid measures add to the usefulness of this volume. For brevity or to facilitate comparison much of the material is presented in outlines and tables. This manner of presentation of material, while helpful to the busy physician, sacrifices the background information that is useful for full appreciation of the rationale behind various admonitions and recommendations. The handbook has been carefully compiled and should prove useful to all who wish a handy and compact reference on poisonous materials.

Hormones and the Aging Process: Proceedings of a Conference Held at Arden House, Harriman, New York, 1955. Edited by Earl T. Engle and Gregory Pincus. Cloth. $8.50. Pp. 323, with illustrations. Academic Press, Inc., 125 E. 23rd St., New York 10, 1956.

This slim volume consists of 18 essays by outstanding endocrinologists who participated in a symposium on the problem of hormones and the aging process. Unfortunately, the paucity of available information on this subject necessitated the inclusion of much material that only by a stretch of the imagination may be said to pertain to gerontology. Moreover, since the aging process is accompanied by such widespread changes throughout the organism, observed alterations of a given hormonal level with age need not necessarily reflect the effect of age but may represent concomitant changes elsewhere in the organism. Thus, the osteoporosis commonly attributed to failure of ovarian function may, in fact, be a consequence of skeletal changes unrelated to the menopause. Despite these general criticisms, the present volume includes excellent reviews and discussions of many topics of current interest to endocrinologists and gerontologists. The topics discussed include urinary steroid and gonadotropic excretion, plasma steroid levels, the thyroid at different ages, the hormonal regulation of muscle, calcium and phosphorus metabolism, protein metabolism, effects of testosterone derivatives, pathology of the aging rat, fluid and electrolyte metabolism, endocrine regulation of prostatic growth, and metabolic balances in aged men. Of more immediate clinical interest are the chapters on osteoporosis, steroid replacement in the aged, and the effects of steroids in breast cancer. The book summarizes the recent experimental studies in these diverse fields and should be of particular interest to endocrinologists engaged in research. The gerontologist may be stimulated to extend his efforts in a field that, although of great promise, remains to be explored. The book is well printed and illustrated, but a more complete subject index would have been helpful.

Medical Parasitology for Medical Students and Practicing Physicians. By William G. Sawitz, M.D., Professor of Parasitology, Jefferson Medical College of Philadelphia, Philadelphia. Second edition. Cloth. $6. Pp 342, with 89 illustrations Blakiston Division, McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, 95 Farringdon St., London, E.C 4, England, 1956.

This book is intended for the use of medical students and practicing physicians. The material is presented from the medical point of view to provide the information necessary for understanding of parasitic diseases. The introduction gives a list of common technical terms used in the text, with a concise definition of each term. A classification of parasites and the classes of the animal kingdom containing medically important parasites is also found in the introduction. The book covers the material in this classification in a clear and informative way. Specific treatment is dealt with in a separate chapter, with the subject well-outlined and the dosage, efficiency, and toxicity of the drugs given. A synopsis of the entire book covers about 20 pages. The final chapter gives techniques for laboratory diagnosis. A fine vocabulary of technical terms and an index conclude the book. This is a well-written and well-illustrated book that fulfills its purpose. It should be of great practical use and interest to the medical student as well as to the practicing physician.

Ankylosing Spondylitis: Clinical Considerations, Roentgenology, Pathologic Anatomy, Treatment. By J. Forestier, M.D , F.A.C.R , F. Jacqueline, M.D., and J. Rotes-Querol, M.D. Translated by A. U. Desjardins, M S, M.D., F.A.C.P. [from La spondylarthrite ankylosante, Masson, 1951.] Cloth. $10.75. Pp. 374, with 145 illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 24-25 Broad St., Oxford, England, Ryerson Press, 299 Queen St, W, Toronto 2B, Canada, 1956.

The authors have recorded their experience with over 400 patients, and their conclusions agree with those of other clinicians. It is to their credit that they have not wasted the reader's time by delving into hypotheses as to etiology and pathogenesis, fields in which they claim no special qualifications The book would be more acceptable if it were condensed and arranged in a more orderly fashion. Few readers will wish to read 375 pages on arthritis of the spine. The translation from French into English has been carefully done, and the ideas of the French authors appear clearly presented. In 1884, A. Strumpell described a disease that he considered unique in that there was progressive ascending ankylosis of the spine without involvement of the peripheral joints. This concept of ankylosing spondylitis is still favored by most American physicians. The present authors, however, consider ankylosing spondylitis a disease that involves the entire locomotor apparatus, particularly the articulations of the spine, those of the shoulders, and those of the lower extremities. Their statement that 75% of their patients had peripheral joint involvement does not conform to the experience of other students of the disease, who report 10 to 15% involvement of peripheral joints. This tends to cloud the issue of whether ankylosing spondylitis is a specific entity or just one form of rheumatoid arthritis.

A Manual of Anaesthetic Techniques. By William J. Pryor, M B , Ch B , F.F A.R C S., Anaesthetist, Thoracic Unit, Christchurch Hospital, Christchurch, New Zealand. With foreword by J. H. T. Challis, M R C.S, L.R.C.P., F.F.A.R.C.S., Senior Anaesthetist, London Hospital, London, England. Cloth. $7. Pp. 224, with 77 illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2, John Wright & Sons, Ltd, 12-14, Triangle West, Bristol 8, England, 1956.

This book was written primarily for residents who are either rotating through anesthesia study or are in the early phases of anesthesia training. It attempts in no way to be complete in details as to various anesthetic techniques, but it does have a fairly good reference list at the end of each section on the various problems discussed. Although, in general, the outlook of the book is British, a great deal of valuable information is contained in these relatively few pages. The organization of the text is orderly and self-explanatory, dealing in general with the various equipment and techniques useful in anesthesia. The various chapters are essentially up-to-date, and the American equivalents for the British drugs are adequately indicated. The illustrations are good and are of sufficient number. The book can be recommended for libraries and for students who wish to get a superficial knowledge of a subject and of references available for further reading.

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

QUERIES AND MINOR NOTES

HYPERSENSITIVITY TO HEAT

To the Editor:—*Is there any possibility of desensitizing skin against sunburn? Last year, after driving wearing short sleeves in an open car on two very hot sunny days, I developed sunburn on both forearms to such a degree that I was incapacitated. A month later I went on vacation and developed, in the same area, an erythema with swelling of the skin and burning and itching discomfort, which compelled me to return home; on this occasion I had not exposed myself to the sun. Evidently perspiration irritated the sensitized area of the skin. During the following months I frequently developed some hives on different parts of my body for which there was no reason found, although I experimented with omitting all kinds of food from my diet, changing my bedroom, changing the type of my clothing, and other measures. Lately, the hives, for which I used different medicaments, have not bothered me much, but the erythema of the arms reappeared on the first hot day, 10 days ago, without exposure to the sun, while I was sitting in a New York theater. The reaction, after some days of treatment, disappeared almost completely, only to return yesterday (a very hot day), again without any exposure to the sun. I have been in perfect health all my life and, particularly, have never suffered from any skin diseases. Is my supposition correct that perspiration irritates the sensitized skin, and is there any way to desensitize skin?*

M.D., New Jersey.

Answer.—This condition appears to be one of hypersensitivity to heat. In this syndrome an exposure to heat may produce local or systemic symptoms. The systemic or distant effects may be those due to systemic histamine release (lowered blood pressure or fainting) or manifestations such as asthma, rhinitis, or skin eruptions. In the local cases one may provoke erythema, urticaria, or angioneurotic edema from local exposure. The original sunburn reaction on the arms may have made that skin more susceptible. Heat hypersensitivity, as well as hypersensitivity to cold, is regarded not as a true allergy but as a lowered threshold of a stimulus that releases histamine. Perspiration can, of course, irritate this type of skin in the same nonspecific sense as it would irritate any kind of skin inflammation. Antihistamines might help to diminish the reactions from heat. If the condition becomes very difficult to manage, administration of the corticosteroid hormones (cortisone or prednisone) might be indicated. It might be possible to achieve a tolerance to heat by systematic exposure to it. This could be done by immersing the forearms in fairly hot water for about three minutes, to be followed by immersion in cold water. Another method is to use daily baths with gradually increasing temperatures.

FUNGUS INFECTIONS OF HANDS AND FEET

To the Editor:—*Please advise me of the accepted treatment of recurring episodes of fungus infections seen in boys previously serving in the Pacific.*

M.D., West Virginia.

Answer.—The majority of the persistent recurrent eruptions of the hands and feet occurring in servicemen who were in the Southwest Pacific, and in other tropical areas, were eczematous eruptions due to multiple etiological factors and not to fungus infections. However, a significant number of men did acquire chronic fungus infections of the feet for the first time, usually including involvement of the toenails; a much smaller number acquired infections of the hands, with or without concomitant involvement of the fingernails. Such infections are almost always due to Trichophyton purpureum. Fungus infections of the feet, hands, and nails due to Trichophyton purpureum are very resistant to all types of treatment and, indeed, essentially incurable, although usually appropriate treatment improves the condition. Infections with the same organism involving the body or the groin usually respond to treatment and, in most instances, can be cleared up permanently. These chronic fungus infections of the feet and/or hands are characterized by scaling, slight erythema, varying degrees of maceration in the interdigital surfaces of the feet, and often some degree of fissuring between the toes. Usually, there is no vesiculation and no sign of eczematization.

Many therapeutic agents have been recommended. Probably there is no more effective medicament than one-half strength Whitfield's ointment applied at bedtime and/or 3% salicylic acid and 6% benzoic acid in 70% alcohol applied twice daily during the day. If there is excessive perspiration, it is well to use a foot powder, such as one of the higher fatty acid preparations (Desenex or Sopronol). The patient should be advised to wear light porous shoes, insofar as this is possible. Such measures tend to be palliative; there are apt to be periodic exacerbations, in which case treatment should be reinstituted. Chronic fungus infections of the toenails are essentially incurable. Persistent treatment of infected fingernails, including piecemeal removal of the involved nail with a nail file, followed by the application of the salicylic acid and benzoic acid preparations noted above, may result in the cure of a fingernail infection, but if there is involvement of at least several nails, the prognosis is not good. Surgical avulsion of the fingernails as a therapeutic measure is not recommended.

PREGNANCY FOLLOWING MASTECTOMY

To the Editor:—*A 23-year-old woman had a simple left mastectomy in November, 1955, followed by 18 x-ray treatments. Pathological diagnosis was carcinoma of the left breast. Since that time she has married and has gained about 30 lb. (13.6 kg.) in weight. At present she has no complaints and examination is negative. She is now two months pregnant. Please advise as to treatment. Should a therapeutic abortion be done?*

M.D., Pennsylvania.

Answer.—Greenhill (Obstetrics, ed. 11, Philadelphia, W. B. Saunders Company, 1955, p. 572) says: "In the absence of any trustworthy guide to prognosis, it does not seem justifiable (except under unusual circumstances) to jeopardize the life of the mother by allowing her to bear additional children. Patients who desire to become pregnant following radical mastectomy should wait at least three years if axillary metastases were not present at the time of operation and five years if axillary metastases were present." In view of the fact that this patient conceived only about seven months after the radical mastectomy and within even less time after the x-ray therapy, the pregnancy should be terminated.

COLD PERMANENT WAVES

To the Editor:—*What is known concerning the toxicology of thioglycollic acid as it is used as a softener in permanent waves? I am principally concerned with a problem of headaches, edema, and a transient dermatitis in a beauty parlor operator who states this material is the only known toxin to which she might be exposed. The cardiovascular system presents no abnormalities; serum proteins, liver function, and renal function seem to be intact. While the edema is at times premenstrual, it may occur at any time. The patient has diuresis up to 12 lb. (5.4 kg.) at times with one mercurial injection.*

Larry H. Birch, M.D., Marion, Ohio.

Answer.—It has been estimated that 2 million cold permanent waves, employing salts of thioglycollic acid, are given each month. The number of reactions is small when this total figure is considered. However, the alkaline solutions of the thioglycollates, currently used in cold hair-waving solutions, are not inert physiologically and may produce local and systemic reactions. Beauty operators who are exposed daily to varying quantities of this solution would be especially prone to such reactions. It is also

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

PARALYSIS AFTER PENICILLIN INJECTION

To the Editor:—*In Queries and Minor Notes, March 10, 1956, page 921, an instance was reported of flaccid paralysis of a leg occurring 24 hours after injection of penicillin on that same side. The deposition of injectables such as penicillin or diphtheria, tetanus, or pertussis vaccine in or around the sciatic nerve is capable of effecting nerve damage resulting in paresis or paralysis. These are generally reversible reactions, with return of normal function in a majority of instances. The injection of a foreign substance, protein or chemical, is capable of producing a localized inflammatory response as a consequence of mechanical, irritant, or allergic action. The tissues invaded, as well as the adjacent tissues, partake in the response, which in some instances may be severe and long-lasting. Such persisting reactions are to be expected, especially with the long-acting preparations of penicillin or other therapeutic or immunizing substances, because the reaction is intensified by the combination of these materials with alum or aluminum precipitates, and the like.*

It would seem that the paralysis might be the result of traumatic damage from the material itself to the sciatic (or radial) nerve, which with a coincident attack of poliomyelitis might erroneously be imputed to be a predetermined localized poliomyelitic paralysis. Firstly, the poliomyelitis must be established by other diagnostic criteria, such as concomitant meningeal symptoms and positive spinal fluid. Secondly, even with a confirmation of the coexistence of poliomyelitis, one must be aware that the paralysis may still be due to the localized damage of the injection and not to invasion of the poliomyelitis virus into the "traumatized" site.

It would be my suggestion that therapeutic and immunizing substances be injected well into the periphery of the upper, outer quadrant, avoiding the hip joint capsule, so as to avoid proximity to the sciatic nerve. In the arm, similar consideration of the anatomy of the radial nerve should be given. Medical judgment is being influenced by the hysteria produced by indiscriminate association of injections with poliomyelitic paralysis. It would seem obvious to those of us who are constantly injecting that, in many instances, such paralysis is purely coincidental, occurring with no correlation with localizing poliomyelitic paralysis.

CLIMATE AND CORONARY DISEASE

To the Editor:—*The reply to the question on climate and coronary disease on page 1211 of* The Journal, *July 21, 1956, contains, in my opinion, a misleading remark. Persons with coronary disease who reside permanently in low elevations should not be encouraged to change to high altitudes. Despite the lower humidity in such locations, the strain on the cardiovascular system during the period of acclimatization may add further damage to the already existing disease. In this age of fast transportation, the impact of the high mountain climate is sudden and profound. Full acclimatization at an altitude of 1 mile may take as long as 6 to 14 days for middle-aged persons in good health. This applies to all tourists and visitors who lack experience and advice pertaining to their activities in high elevations. Older people or patients with such conditions as cardiovascular disease, hypertension, renal insufficiency, or pulmonary tuberculosis with tendency to hemoptysis should be advised against a sojourn in the mountains without adequate preparation. Short stops of a few days duration in step-like increase of altitude would greatly minimize the danger. The same precaution should be observed on the return trip. It is deplorable that general interest in bioclimatology is at a low ebb to the disadvantage of all those who could substantially profit in terms of good health and comfort from an appropriate change of climate.*

LOW GAMMA GLOBULIN LEVEL

To the Editor:—*In the March 10, 1956, issue of* The Journal, *page 920, was a query concerning a patient with a "low gamma globulin level." We should like to offer a clarifying statement. It is not apparent from the query whether the patient has the rare syndrome of acquired agammaglobulinemia. If she does, then the gamma globulin dosage recommended in the answer is far too low. There is abundant evidence and reasonable agreement that ideal therapy in these cases consists of monthly injections of 0.1 gm. of gamma globulin or 0.6 cc. of gamma globulin solution per kilogram of body weight. Some patients may also require continuous prophylactic antibiotic therapy. Since, by these recommendations, the management of hypogammaglobulinemia may be painful and expensive, prophylaxis should not be initiated unless the diagnosis of agammaglobulinemia is established on a firm basis. It has been our experience that most of the patients referred to us as having hypogammaglobulinemia after the performance of a single electrophoretic study have normal amounts of gamma globulin in their serums and a completely normal immunologic mechanism.*

If the patient referred to in the query merely has frequent upper respiratory infections, with a gamma globulin level near the lower limits of normal, then there is as yet no convincing evidence that gamma globulin will be of any therapeutic value. Indeed, there is evidence that such repeated injections may be harmful, as well as being a deplorable waste of precious human resources.

PRICE OF NEW DRUGS

To the Editor:—*In* The Journal, *June 23, 1956, page 772, a letter from a physician in Pennsylvania appeared questioning the cost of new drugs and medicaments. As a pharmacist, I also had often questioned the failure of the large pharmaceutical houses to reduce the price of their products after they had obtained the original cost of research. My questions were answered, however, on a recent tour of one of the larger pharmaceutical plants in the United States. I saw a tremendous amount of research, both time-consuming and expensive, being conducted by a host of top scientists. The future of this company, like many others, is tied in with the development of new products. Millions are spent yearly on pharmaceutical research, and the cost is partially defrayed by the profits from recent products. The prices of today's so-called miracle drugs cannot be reduced, because they are financing the miracle drugs of tomorrow.*

HEADACHES

To the Editor:—*I am writing in regard to the answer to a question on headaches in* The Journal, *July 7, page 1033. The answer did not include the possibility that this patient's headache was on the basis of functional hyperinsulinism. Unless a six-hour glucose tolerance test were done, an isolated blood chemistry study might never show the hypoglycemia. The failure to recognize the possibility of functional hyperinsulinism has been the greatest source of error in my 20 years of specialization in the field of neuropsychiatry. The questioner is referred to the work of Seale Harris on dysinsulinism and hyperinsulinism (J. A. M. A. 83:729 [Sept. 6] 1924;* Ann. Int. Med. *10:514 [Oct.] 1936) and the book "Body, Mind and Sugar" by E. M. Abrahamson and A. W. Pezet (New York, Henry Holt & Company, Inc., 1951) and also to a letter by Stephen Gyland that appeared in* The Journal *(152:1181 [July 18] 1953) in Queries and Minor Notes.*

President Hails New Medicare Program • •
Meeting Scheduled to Negotiate State Contracts • •
Salk Vaccine Purchases Discussed at House Hearing
Oren Harris Likely to Head Key House Committee • •

DEPENDENT MEDICAL CARE

In approving regluations to govern the new military dependent medical care program, President Eisenhower said he did so with "great satisfaction," principally because it will benefit the 40% of the service families who now do not receive adequate medical care from the government. The new act goes into effect on Dec. 8. The President noted that these families will be allowed to use civilian hospitals and facilities, at a cost of only \$1.75 per day or the first \$25, whichever is the greater. President Eisenhower added: "I have been personally interested in this important program since its inception. I feel strongly that this important measure will have a far-reaching effect on service morale at home and on our widely flung posts, ships and bases around the world and thus effectively strengthen the defense of our country." He said the "important improvement" provided by the act "removes one of the greatest sources of worry to our servicemen and service-women around the world."

Meanwhile, the Defense Department has scheduled meetings with representatives of all state societies to work out state contracts. Representatives of the first group of six were called to Washington Oct. 24. They were Michigan, California, Washington, Colorado, New York, and Minnesota. The next session is scheduled for Oct. 29 with Indiana, North Carolina, Oregon, Connecticut, Wisconsin, and Massachusetts. On Oct. 31, negotiations are planned with Maryland, New Jersey, New Hampshire, Vermont, Rhode Island, and Iowa.

Representatives of the Defense Department also will interview, in the field, the agents selected by societies as their disbursing contractors to handle payment of physicians' fees. In some cases the state societies will be their own disbursing agents, in others Blue Shield has been selected. The department is asking answers to 36 questions pertaining to the disbursing agents. In these interviews the department will ask for information on cost accounting systems, their total charges paid in the last year if the organization operated a health plan, extent of their coverage as compared with total health insurance coverage in the state, and the total number and categories of employees of the disbursing agent and their salaries. Also, the department wants to ascertain whether the disbursing agents' equipment and staff are adequate to handle medicare responsibilities, or if additions will be needed. A copy of a recent balance sheet will be requested. The disbursing agency also will be asked whether it is prepared financially to handle the program for the first two months before government payments are received, or will expect an advance from the department.

POLIOMYELITIS VACCINE HEARING

A two-day hearing of a House government operations subcommittee on the pricing of the poliomyelitis vaccine has produced charges and countercharges on the question of whether the government paid a reasonable price for the vaccine. The hearings halted with no final conclusion and with the prospect that they may be reopened later. At the outset the Republican member of the three-man group charged that the sessions were politically motivated. Rep. Chet Holifield (D., Calif.), subcommittee chairman, declared on the second day that there was prima facie evidence that the antitrust laws have been violated by five drug firms in the sale of 13 million dollars worth of the vaccine to the government. He proposed that the Justice Department and the Federal Trade Commission look into the situation.

Dr. David E. Price, assistant surgeon general of the Public Health Service, testified that, in attempting to make cost estimates for the federal grant program, the Department of Health, Education, and Welfare asked each manufacturer individually what its price to public agencies would be. He said four gave a tentative list price of about \$15 for 9 cc., which with the usual discounts to public agencies would net about \$7.12. Two manufacturers indicated that it was impossible to quote prices pending further clarification of testing requirements and new safety standards. In presenting department estimates to Congress, the figure of \$7 for 9 cc. was used, Dr. Price added.

"It is virtually always the case with new biologics that initial costs tend to be high, with reductions coming along later as production expands and becomes more efficient," Dr. Price testified. "Experience with the Salk vaccine has followed this normal pattern. . . . As the companies gained production experience and were able to produce on a greater volume basis, they voluntarily lowered their price, first to \$6.33 in May, and then to \$5.70, the current price." The assistant surgeon general said that, thus far, over \$32,500,000 out of a total of \$53,600,000 allocated to the states has been paid out, either in cash or in vaccine. Five states have used their full federal allotment. The remaining 51 states and territories are drawing on the fund at the rate of almost \$750,000 a week.

DRUG REACTIONS

In a program sponsored by the Food and Drug Administration, 11 large public and private hospitals are making prompt reports on unusual or adverse reactions to drugs. The American Medical Association is collaborating in the project, as are the American Association of Medical Record Librarians, the American Society of Hospital Pharmacists, and the American Hospital Association.

The objective is to obtain specific information regarding effects appearing in some patients when drugs are administered to large numbers of people. The FDA explained: "This problem has been magnified by the increasing number of potent new drugs. Even the

---

From the Washington Office of the American Medical Association.

most extensive clinical studies cannot forecast all types of drug reaction which may develop throughout the population. Hospitals provide an ideal site for observing the effects of drugs and obtaining essential information that is not available from other sources.

Hospitals participating are George Washington University Hospital, Washington, D. C.; Grace Hospital, Detroit; Hartford Hospital, Hartford, Conn.; Oakwood Hospital, Dearborn, Mich.; Lakewood Hospital, Lakewood, Ohio; Medical College of Virginia Hospital, Richmond, Va.; St. Joseph's Hospital, Providence, R. I.; U. S. Naval Hospital, Bethesda, Md.; U. S. Public Health Service Hospital, Baltimore; Walter Reed Army Hospital, Washington, D. C.; Western Pennsylvania Hospital, Pittsburgh.

HEALTH LEGISLATION

The House committee responsible for most health and medical legislation will have a new chairman next year, following the unexpected death of Rep. Percy Priest (D., Tenn.). If the Democrats retain control of the House, the chairman of the Interstate and Foreign Commerce Committee will likely be Rep. Oren Harris of Arkansas, who has served since 1941, one year after Mr. Priest began his uninterrupted service in Congress. Mr. Harris, a lawyer, has been interested particularly in transportation, communications, and natural gas rather than in health bills. If the Republicans take over, the chairmanship reverts to Rep. Charles Wolverton (R., N. J.), who was chairman in the Republican 83rd Congress. His interest in health and medical legislation is well known.

In commenting on the passing of Mr. Priest, President Eisenhower said: "The Congress . . . and the people of the nation have lost a valuable member. . . . Congressman Priest served with distinction. . . . Mrs. Eisenhower and I join with his many friends in Washington and the people of his district and state in extending our sympathy to his family." House Republican Leader Martin declared: "Percy Priest was a great able man. He had no enemies. He was a splendid legislator and a great gentleman." Before coming to Congress Mr. Priest had been a schoolteacher and a newspaperman. For several years he has served as Democratic whip in the House.

SURPLUS PROPERTY DISPOSAL

To dispose of federal surplus property for the benefit of state and local civil defense organizations, the Federal Civil Defense Administration has established a new office. In charge is John Thomas, former head of personal property utilization for the General Services Administration. The program will be operated through FCDA's regional offices, in close coordination with state and territorial civil defense directors. Action by the last Congress makes possible allocation of surplus goods for civil defense work. Prior to that, the material could be given only to health and educational institutions. Some ambulances, stretchers, and trucks are expected to be made available for medical civil defense work.

Another FCDA development is production of a new kit designed to explain the threat of biological warfare and to tell how to counteract effects of biological warfare on people, livestock, and crops. Four film strips with accompanying sound records, six pamphlets, and a special instruction leaflet make up the kit. The FCDA has also issued a new set of "planning assumptions" that estimates damage that might be done and medical and other problems created by an enemy attack. While these are in no sense predictions, the FCDA says the assumptions were drafted "through appraisal of available intelligence and information on the most recent known or estimated capabilities of potential aggressors to attack the United States." In contrast to earlier efforts in this field, the new planning assumptions are not restricted to a certain year but will be amended or replaced as more information in the field becomes available.

RESEARCH FOR MENTAL ILLNESS

Carrying out the instructions of Congress, which this year voted 2 million dollars for the work, the Public Health Service is establishing a new unit to assist in developing scientifically sound research programs on tranquilizing and other drugs used in the treatment of mental illness. The new project, to be directed by Dr. Jonathan O. Cole, will be known as the Psychopharmacology Service Center in the National Institutes of Mental Health in Bethesda, Md. The center will develop a nationwide research program designed to stimulate support for basic research and preclinical and early screening and testing of tranquilizing and other such drugs. Among other things, the center will provide technical assistance and research advisory services to scientists.

PERSONNEL

The initial operation of the construction grants program for federal water pollution control will be directed by Curtiss M. Everts of Portland, Ore. . . . William C. Fitch has been named director of the special staff on aging in the Department of Health, Education, and Welfare. It is a new job created by the expansion of the department's activities relating to older persons. . . . Mary Jenney, senior nurse officer in the Public Health Service, will head the first federal program to further education of qualified graduate nurses. . . . Dr. H. Max Houtchens has been named chief of the Veterans Administration clinical psychology division in Washington, D. C. He succeeds Dr. H. M. Hildreth, who has accepted a position in the PHS. . . . Dr. John R. Lindsay, professor of otolaryngology at the University of Chicago, has been appointed to the National Advisory Neurological Diseases and Blindness Council for a four-year term. . . . George Washington University has selected Rear Adm. Lamont Pugh, former Navy surgeon general, as university physician.

MISCELLANY

The Arkansas State Board of Health has received a grant of $38,780 from the Children's Bureau for a special project for mentally retarded children, the first money allocated from a special million-dollar fund voted by Congress. . . . The Red Cross Blood Program, which supplies about 40% of the blood used by U. S. hospital patients, received 2,073,000 voluntary blood donations in the past year. . . . Public Health Service scientists have found that excess aldosterone is secreted by the adrenal glands of dogs with edema. Aldosterone was previously implicated as an important factor in edema.
